41, 5. tatá, "whence, from whom", is composed of táta? where? and the interrogative particle há. The sentence is incomplete, though intelligible to the Indians; the full wording would be: tatá nû tû'mĕna, or: tat há nû tumĕnátko gi: "from whom I have heard it".

41, 7. ḵaítua sháyuaksh: "she has not the ability or intellectual disposition to do us any harm."

41, 14. hak, short for hûk; although rendered here by "this", it has to be taken in an adverbial sense: "this time". The adverb corresponding to the hak of the incident clause is the táta in the principal one.

41, 18. tamû' lish etc.: "have ye made yourselves ready?"

41, 20. shugúlaggi. See Dictionary, s. v. shukû'lki.

41, 21. After nûsh kánash may be supplied: "I do not want that anybody cast a blame upon me."

42, 1 etc. The party, on arriving, were greeted by the Indians with extreme cordiality, and General Canby gave to each a cigar. Eight men were there, instead of the five unarmed leaders, as promised by Boston Charley. The parts for the bloody work had been allotted as follows: Skóntchish had to kill Meacham; Boston Charley, Dr. Thomas; Black Jim, the agent Dyar; Bantcho, Riddle; and if Gen. Gillem had been present, Hûka Jim would have fired on him. Chief Jack had undertaken the assassination of Gen. Canby. The two other Modocs present, completing the number eight, were Shacknasty Jim and Ellen's man. Scarface Charley also appeared on the scene, but not with hostile intentions. The date of the assassination of the Peace Commissioners is the 11th day of April.

See full account of the massacre in Meacham's Wigwam and Warpath, and (much shorter) in his Winema, pp. 57–62.

42, 2. hemkankelgi' is probably: hemkankō'la gi: "has to be talked over to the end."

42, 3. After shlépaktgi there is ellipse of shanáhuli, "I desired", or "desire". The rights alluded to were such as would be equivalent to American citizenship. The sentence has to be construed as follows: nû shaná-uli mâ'lash tídsh núsh(-toks) shlépaktgi, wákaktoks, etc.

42, 4. shkuyuepĕlítki. Capt. Jack's condition for further peace-negotiations was the removal of the troops from the Modoc country by General Canby.

42, 7. Modoc tgo-úlχa for Klamath tgélχa.

42, 9. When Gen. Canby had been killed and stripped of his uniform, he was turned with his face downwards and his scalp taken. The scalp was raised on a pole in the lava beds and dances performed around it, which lasted several days.

42, 11. Dr. Thomas was killed by a second bullet, which passed through his head; he was stripped of his garments and turned upon his face, after his murderers had taunted him with not believing Toby's statement.

000

42, 12. A "Sunday kí-uks", or Sunday Doctor, stands for preacher, and the meaning of the sentence is a mockery, contrasting Dr. Thomas' vocation of preacher and mediator between the two contending powers with his ignoble death brought on by cowardly murderers.

42, 12–16. Skóntchish's bullet passed through Meacham's coat- and vest-collar; he retreated forty yards, while walking backwards; Toby in the mean time tried to save him by grasping the arms of his pursuers. He fell from exhaustion on a rock, and there was shot between the eyes by Skóntchish and over the right ear by Shacknasty Jim.* This Indian despoiled the unconscious man of his garments, and prevented another from shooting him in the head, declaring that he was a corpse. These two left, and Toby stayed alone with him. Then Boston Charley came up, holding up a knife to scalp him. Toby prevented him by force from doing so, and in the struggle which ensued she received a heavy blow on the head from the end of his pistol. Boston Charley had completed one-half of the scalping operation, when Toby, though stunned by the blow, shouted "Shúldshash gépka!" Though no soldiers were in sight, this caused the desperado to take to his heels immediately and Meacham's life was saved. Riddle escaped the Indian bullets, being covered by Scarface Charley's rifle, and agent Dyar was rescued by running fast, though hotly pursued by Húka Jim.

42, 18. After the massacre of the Peace Commissioners, the services of the Riddles as interpreters were no longer required. From this date, the report given by them becomes meagre in details, because they withdrew from the immediate vicinity of the battle-fields.

42, 18. One of the two divisions was commanded by Colonel Mason, the other by General Green, and the three days' fight took place on the 16th, 17th, and 18th of April. A heavy bombardment of Capt. Jack's headquarters in the cave (kū'mme lalaúshaltko) went on at the same time.

42, 19. kū'mme lalaúshaltko, the rocky cave, forms epexegesis to lákiam tchī'sh, 42, 18: the refuge, or stopping place of the Modoc chief.

42, 20. ámputala. The troops cut the Modocs off from the waters of Tule Lake, the only water they could obtain to quench their thirst.

42, 20 and 21. Wewánuish, etc. The meaning which the author wanted to convey by this sentence is: "the women and children remained in Ben Wright's cave, though a portion of them were to be moved out from it." See kü'ktsna (in Dictionary).

43, 1. Mō'dokni is here an *adjective*, qualifying the substantive hishuátchχăsh, and shelluáltko is participial phrase determining the verb temporally: "two Modoc men, after the fight had lasted three days, were killed."

43, 1. hăshχē'gi is a "plural" verb used only in the Modoc dialect; Klamath: hushtchóχa. To kill *one*, the singular form, is shíuga in both dialects. The two Indians killed by the explosion were boys, who were playing with an unexploded shell which they had discovered on the ground. One of them was named Watchnatati.

43, 3. kē'ktgal, etc. The Modocs vacated their cave in the lava beds on April 19 on account of the terrible losses experienced by the three days' bombardment, and retreated, unseen by the troops, to the vicinity of Sand Hill, about four miles SSE. of Ben Wright's cave. The two officers who followed them with about 75 regulars and 30 Warm Spring scouts were Capt. Evan Thomas, Battery A, Fourth Artillery, and

---

*This is indicated in the text by the instrumental case of láp'ui: lápentka, by two shots, which were fired *by two men*. The five other wounds he had received before.

000 First Lieut. Thomas F. Wright, Twelfth Infantry. The Sand Hill fight took place on April 26, and lasted about three hours; the troops were surrounded by the enemy and lost 21 men killed, 18 wounded, and 6 missing. The Modoc loss amounted to four men, as supposed.

43, 3. wigá gin for wiká gēn: not far from there they made another stand.

43, 4. tánkni waitólan can also mean: "the next day" in the Klamath dialect.

43, 5. Yámakni. The Warm Spring Indians occupy, in common with Wasco Indians, a reservation on Lower Des Chutes River, Oregon, and are congeners of the Nez Percés, both being of Sahaptin race. Being the inveterate enemies of the Shoshoni or Snake Indians, the U. S. Government formed a corps of scouts from able-bodied men of that tribe, which did good service in the numerous hard-contested fights with the Snake Indians. At the outbreak of the Modoc war, these useful allies naturally suggested themselves as the best auxiliaries against the revolted tribe. Donald McKay organized a corps of 72 scouts and rejoined with them Col. Mason's camp April 10, 1873. A few later accessions carried them up to an effective force of about ninety men.

43, 8. To taktaklánta supply käflatat.

43, 10. lápēni taúnep, etc. Instead of giving the numbers of killed and wounded, our informant simply gives the number of the survivors. The Warm Spring scouts are not included.

43, 13. Capt. Hasbrouck, of the Fourth Artillery, was then in command of a mounted battery, and accompanied by Capt. Jackson, in command of B troop, First Cavalry, and by sixty Warm Spring scouts.

43, 14. The fight at Dry Lake or Grass Lake occurred on May 10. Thirty-four Modocs attacked the troops at dawn, but were forced to retreat. The troops sustained a comparatively trifling loss.

43, 15. túnep pé-ula stands for taunepánta túnep pé-ula: fifteen. Cf. 40, 1 and *Note.*

43, 16. Changes of grammatic subjects, and even their omission, are not unheard of in incoherent Indian speech. Thus Bóshtin has to be supplied here between nāsh and stanótchna, and the meaning is: "the troops killed one of the retreating Modoc warriors."

43, 17. Pahátko É-ush stands for the more explicit form Pahápkăsh É-ush·gí'shi; cf. 43, 13.

43, 22. shútanka properly means: "to negotiate", but stands here euphemistically for "to surrender". The same is true of gawína, **44**, 2, the proper signification of which is "to meet again".

44, 1. General Jefferson C. Davis was the officer whom the President had, after Gen. Canby's assassination, entrusted with the conduct of the Modoc war. He assumed command on May 2, relieving the intermediate commander, Col. Alvin C. Gillem, of Benicia Barracks, California.

44, 2. shát'la káyaktcha stands for shátēla kayáktchtki and was preferred to this form to avoid accumulation of consonants.

44, 2. lak̲í for lák̲iash. When speaking fast, Klamaths and Modocs sometimes substitute the subjective for the objective case in substantives which are in frequent use, as mák̲laks for mák̲laksash, **44**, 9. 55, 4.; wéwanuish for wewanuíshash, etc.

44, 3. sundē·gíulan, over a week; lit. "a week elapsed". On June 1, 1873 Capt.

COO Jack and his last warriors surrendered to a scouting party of cavalry, not to the five Modocs sent after him.

44, 5. Fort Klamath ídsha, or better: Fort Klamathχé'ni ídsha. The national name for this locality is I-ukáka, I-uk̲ák̲, E-ukák.

44, 5. hashuátko, uncommon Modoc form, contracted from hashashuakítko, by elision of two syllables.

44, 6. stinâ'sh for shtinâ'shtat. Generic nouns of places, dwellings, etc., easily drop their locative case-suffixes and case-postpositions; cf. käíla for käílatat, 44, 8 and 9. Yámak, 44, 10, is an abbreviation of Yámatkshi or Yámat-gishi.

44, 7. kshaggáya is incorrectly used here instead of iggáya, which is said when a plurality of long-shaped objects (including persons) is referred to.

44, 8. íggaya. The execution of the four malefactors took place at Fort Klamath on the 3d of October, 1873, under an immense concourse of Indians and whites living in the vicinity. It is estimated that the whole Klamath Lake tribe was present, men, women, and children. The gibbet constructed for this purpose, of enormous magnitude, stands there at the present day. Bantcho and Slúlks were sentenced to imprisonment for life. Bantcho died some time in 1875 in the fortress and prison of Alcatraz Island in the harbor of San Francisco, California, and Slúlks is serving his term there at the present time.

44, 9. atí käíla. The approximate number of Modocs brought to the Indian Territory for having participated in the revolt, was 145, women and children included; they were first placed on the Eastern Shawnee reserve, and afterwards removed to that of the Quapaw Indians. Owing to the moist and sultry southern climate of their new home, many of their children died during the first years after their arrival, and the Report of the Indian Commissioner for 1878 states 103 as the whole number of the Modocs remaining in the Territory.

To facilitate a prompt reference to the historical events described in this long article, I present the following division of its contents:

33, 1. Negotiations terminating in the return of Capt. Jack's Modocs to the Klamath Reservation.

34, 18. Difficulties causing a split in the Modoc tribe. Capt. Jack returns to the Lost River country with one half of the Modocs.

36, 9. The Government of the United States called to the rescue by the Lost River settlers.

37, 3. The massacre on Lost River, and the attack on the lava beds.

38, 3. President Grant appoints a Peace Commission. Negotiations progressing.

39, 10. The capture of Modoc horses makes further negotiations impossible.

39, 20. Toby Riddle reveals her terrible secret.

40, 12. A Doctor of Divinity among the Modocs.

40, 22. Toby Riddle tried by her countrymen. Last warnings given to the Peace Commissioners.

42, 1. Assassination of the Peace Commissioners.

42, 18. Bombardment of the lava beds and the Sand Hill fight; the fights at Dry Lake and near Fairchild's farm.

44, 1. The closing scenes of the tragedy.

000

BIOGRAPHIC NOTICES OF MODOC CHARACTERS.[1]

GIVEN BY J. C. D. RIDDLE IN THE MODOC DIALECT.

I. TOBY RIDDLE.

Toby ketchkáne mák̲lăksh gátpa Ya-ága k̲ók̲e Yamatkní'shăm kăíla
Toby a little Indian became on Williamson River of the Oregonians in country
pă'dshit skō' 1842. Húnkĕlăm t'shí'shap T'-shíkka; húnkĕlăm p'kí'shap
just then in spring 1842. Her father (is) T'shikka; her mother
k̲'léka hû ndă'ne illólatko. Hû p'ná t'shísha té-unăpni illólash túla tchía,
died she (being) three years-old. She (with) her father ten years together lived,
at tû génan Tá-uni wigátan p'χádsha p'na túla tchía.
then far going Yreka close by cousin her own with she lived.

Ndankshaptánkni té-unip Móatuash mák̲lăks Mōdokíshăsh wátch 1857
Eighty Pit River Indians from the Modocs the horses 1857
illō'lash pálla. Mō'dokni wátch haítchna, at pshí'n mák̲lĕka; mbû'shan
in the year stole. The Modocs the horses pursued, and at night they camped out; next day
pă'ktgisht Móatuash gû'lki. Mō'dokni tchámptakian hûhátchna; Toby
in the dawn the Pit Rivers attacked (them). The Modocs frightened started to flight; Toby
hemkánka: "k̲á-i hûhátchantgi", ndă'ni té-unepni Mō'dokni shellual-
cried: "not they must run", (and) thirty Modocs to fight
támpka. Mă'ntchtoksh shishō'ka, at Móatuash tpûdshá, lû'luagshla vû'nîpni
recommenced. For a long time they fought, then the Pit Rivers they repulsed, (and) captured for-
té-unep Moatuáshăsh í'pkan lû'lûagshlan. Păn pshí'n Móatuash gû'lki,
ty Pit Rivers keeping (and) enslaving (them). Again at night the Pit Rivers attacked,
tû'mi tchúi Móatuash. É-ukshikni at Mōdokíshăsh shídshla, pĕn vúiχe
many (more) Pit Rivers. Klamath Lakes then the Modocs helped, again they conquered
yímeshgápalan p'nálam wátch, Móatuashăm tchí'sh wátch ídsha. Lápĕni
taking back their own horses, of the Pit Rivers also the horses they drove away. Twen-
té-unep păn túnep Móatuash shuénka, tû'm k̲á-i shléa; lăp Mōdokíshăsh
ty and five Pit Rivers were killed, many not found; two Modocs
shuénka, ndăn shlíuiya, túnep E-ukshikíshash ngē'she-uiya. At mák̲lăks
they killed, three they wounded, five Klamath Lakes they wounded. Then the Indians
Tóbiash sheshaloli'shăsh sháyuakta.
Toby a fighter knew her to be.

Shálam illólash 1859 at hû hishuatchkáshla Tchmû'tchash. Illólash
In the autumn in year 1859 then she married Frank Riddle. In the year
1862 at sha'hmū'lgi Sháshtiăsh E-ukshikíshas Mōdokí'shash tchi'sh, at
1862 she called together the Shastis the Klamath Lakes the Modocs also, when
lápĕni waitō'lan hemkánka nánuk máklăks: "at nánuk tchékĕli vûmí'
after two days declared all the tribes: "now all blood is buried

000 p'nálam shelluáluish". At shû-utánka Tá-uni Skuä' Stí'lämgshi, Skuä'
of their hostilities". Then they made the treaty at Yreka in Squire Steele's office, Squire

shāsh nā'sh waítak shuénktgî.
diers on one day to kill.

NOTES.

54, 1. ketchkáne or kitchkáni m. g. is a queer way of expression for the more common giúlχa: "was born".

54, 1. Yá-aga k̲ók̲e is the present name of the locality on Williamson River where the Government bridge was built since her infancy, about one mile from the mouth of the river. Williamson River is simply called K̲ók̲e, "river", and on its lower course resides the largest portion of the É-ukshikni or Lake People.

54, 1. Yamatkni'sham, E-ukshiknísham, etc., are forms often met with, though ungrammatic; the correct forms are Yamatkísham, E-ukshikísham, Mōdokísham, etc.

54, 2. T'shikka means simply "old man". He was still living in 1876.

54, 3 etc. The event described in these lines took place on one of the raids which the Klamaths and Modocs undertook every year before the gathering of the pond-lily seed against the California tribes on Pit River, for the purpose of making slaves of their females. If the numbers of Indians enslaved, wounded, and killed are correct, the raid of 1857 must have been of unusual magnitude, as will be seen by comparing the statements of Dave Hill in another portion of our texts. Among the horses stolen was a fine saddle-horse belonging to Toby, and this theft may have stirred her personal feelings of revenge to the utmost degree. After her successful charge at the head of her braves, she did not allow the fallen Pit River Indians to be scalped.

54, 9. tpûdshá. The accent rests on the last syllable because the particle há has coalesced with the terminal -a: tpû'dsha há. Há is equivalent to "with their own hands"; há lúyamna, I hold in my hand. Many other verbs are occasionally accented in the same manner, as ítá, shnûká, lakialá.

54, 12. yimeshgápalan; through a difference in the prefix, the Klamath Lake dialect would say t'meshgápalank.

54, 13. See Meacham, Winema, p. 32 sq., who speaks of *three* dead enemies only.

55, 1. 2. Mr. Elijah Steele, Superintending Agent of Indian Affairs for the Northern District of California, met in council the Klamath Lakes, the Modocs, and three tribes of Shasti Indians, with their chiefs, near Yreka, on April 14, 1864 (not 1862), and to his mediation was due the peace-treaty between these tribes, including also the Pit River Indians (who had not sent any deputies), published in Ind. Aff. Report for 1864, pp. 109, 110. Toby does not figure among the interpreters at this council; but there are

000 two other names of "interpreter for the Modocs": H. K. White and T. S. Ball. The raids on the Shasti Indians were mainly undertaken for horse-stealing, and the hostile feeling between them and the Klamaths and Modocs was never very intense, since frequent intermarriages took place. Cf. Steamboat Frank's biographic notice: 55, 9.

55, 1 and 3. Tá-uni. Every *town* is termed so, as Linkville, Ashland, Yreka; San Francisco or Portland would be mû'ni tá-uni. In this connection, Yreka, Siskiyou Co., California, is meant. Cf. also 54, 4. Tá-uni has the inessive postposition -i suffixed, and means *in a town, near a town*, or: *the country around a town*.

55, 4. =gitkash is an ungrammatic form standing for =gípkash.

55, 3–7. Meacham, Winema, p. 34, speaks of an affray in which Toby interfered in a perfectly similar manner, though the names of the combatants differ, and the end of the fight was not extermination, but personal friendship.

55, 8. Tchimä'ntko means "widower".

55, 10. Had Steamboat Frank, with his fifteen warriors, succeeded in entering from the south across Lost River into Klamath reservation, near Yáneks, and in surrendering there, this would have saved him from further prosecution, as he thought.

55, 12. For úyamnatko and íyamnatko, see *Notes* to Modoc war, 34, 10.

55, 13. The sentence shéllualsh tads etc., refers to the vote taken by the tribe a few days before the ominous eleventh day of April. Thirty warriors voted for continuation of the war, thirteen voted for peace; cf. 40, 1. 2.

55, 13. hi means in the interest of the tribe and its independence. See *Notes* to Modoc war, 37, 1.

55, 14. He went with the American troops in the quality of a scout. Nothing illustrates the real character of some Indian wars as well as this instance: an Indian who has fought with the most decided bravery against the enemy of his tribe, is ready, as soon as the chances of war run against his chief, to sell himself for a few coins to the enemy, body and soul, and then to commit upon his own chief the blackest kind of treason. Cf. Modoc war, 44, 2.

55, 14 etc. From the verbal stíltish depends the sentence: k̲á-i kshaggayuápkash hûk shiû'ga (or: shiugátki), and from k̲á-i shiû'ga depends k̲aigiúga. This is the verbal causative of k̲aihía, to hunt for or in the interest of somebody, and the indirect object of it is shû'ldshăsh: "for the troops". Hûk in hûk shiû'ga refers to Steamboat Frank, not to Captain Jack; were it so, hûnk would be the correct form, pointing to somebody distant.

55, 17. stûtχámpkash, to be derived from stú, stó: way, road, passage; meaning passage-way of the voice through the throat.

55, 21. 56, 1. The pronoun hû', *he*, appears here under the form of ŏ'.

56, 1. Scarface Charley was run over by a mail-stage, and obtained his name from the scar resulting from that casualty. For shellualshē'mi there is a form shellnashē'mi just as common.

56, 1. 2. Scarface Charley surpassed all the other Modoc chiefs in skill, strategy and boldness; he was the engineer and strategist of the Modoc warriors, and furnished the brains to the leaders of the long-contested struggle.

56, 3 etc. Hû lä'p etc. The two commanders referred to were Capt. Thomas and Lieut. Wright. Cf. Modoc war, 43, 7–12 and *Notes*.

56, 7. nä'sh waítak for: nä'sh waíta ak: on one day *only*, on a single day.

E-UKSHIKÍSHAM MÁK̲LAKSAM NÉ-ULAKS.

*539

m'na snáwädsh, tsúi ni snä'kĕlua; gä'tak lak̲í gi hûk.
his wife, then I remove (him); no longer chief remains he.

NOTES.

[177] **58–62.** The legal practices, regulations, and ordinances given here by a subchief of the Klamath Lake tribe are observed by all the chiefs, and are apparently fashioned after American models. The principle which seems to guide most of the judicial decisions of the chiefs, is given in one (59, 20. 21) of these regulations: "If a chief makes law like white people, that will be right."[*] This article is composed of three parts:

Part I. List of the chiefs acting as judges on the reservation in 1877.

Part II. Legal customs governing the Klamath Lake people.

Part III. Instances of application of these legal customs; amount of fines, terms of imprisonment, etc. These are the "*novellæ*" of Klamath legislation.

58, 1–3. P'lú, Lilu, and some other headmen mentioned here have signed the treaty of Oct. 14, 1864.

[563] [657] **58, 4.** Móatuash. There are only two Pit River *families* living on the whole reservation.

58, 8. Tcháktot belongs to the Yahúskin tribe of Snake Indians. Cf. Ind. Aff. Report 1873, p. 324.

[193] **58, 10 etc.** The future tense employed in these behests, regulations and defenses recalls the French future used in an impressive manner instead of the imperative: *tu ne tueras point, tu ne déroberas point.*

58, 10. shlí-uapk shash. The pronoun shash has here almost the force of a reciprocal pronoun, for the meaning of the sentence is: "do not shoot at people of your own tribe." The same is true of sas in palluápk sas, 58, 10; 58, 13 (twice); pálla shash, 61, 14.

[194] **58, 10.** ksaggayuapkámsni is pronounced as one word, as the removal of the accent from the syllable -uápk demonstrates; and so in many of the following verbs standing in the future tense. For the sake of clearness, I have preferred to resolve these forms graphically into their component elements.

[192] [193] **58, 11.** wátsam, etc. The possessive wátsam stands here instead of the instrumental case watsátka through attraction from wännikíshham. Tchíkla here means to ride away on another's horse, the horse being missed by his owner.

---

[*] Dave Hill introduces himself in the first person as chief; but many of these decisions can be given by the headchief only, not by any of the subchiefs, to whose number Dave Hill belonged. The Modocs at Yáneks claim to observe these regulations; the Snake Indians do not.

*539 58, 15. shetcháktanuapk stands for the more common form: shitcháktanuapk.

622 58, 16. nánuktua shéshatuish m'na: "all what your husband has transferred to 692 your parents to obtain your hand"; m'na stands for hishuáksham. Cf. 61, 8.

[193] [192] 59, 7. mish, *you, to you*, is often used in this article for málash, málsh, *ye, to ye*, in allocutions to two or more persons. This is a way of expressing what may be called the "inclusive plural of the second person". This mode of speaking is observed in m's lápuk, 59, 7; lápuk mish, 59, 7. In the same manner i stands for ăt, 59, 8: i sissókuapk, if ye whip each other; also 60, 22.

59, 9. i mí stands for mish mí.

59, 17. hă k̲úi gí'uapk: if he should fail to do his duty; 59, 19. hă tídsh gí'uapk: if he does his duty well; nanuktuánta: in every respect.

59, 22. í'χaks mí: what you may win by betting on the horses engaged in the race.

60, 2. kä'lish is the objective case of kä'liak, kéliak, "not having", the simple form of which, without -ak, would be kä'li or kä'liu (kä'li hû).

[583] 60, 11. túma wátch gitk. The horses have, of course, to be transferred to the parents of the bride and not to any of the chiefs.

[231] 60, 12. wátch. The horses owned by the Klamath Lake and Modoc people are valued from 20 to 25 dollars each; they descend from the hardy, enduring race of Cayuse ponies, and were originally obtained by bartering commodities with the Columbia River Indians at the Dalles, Oregon.

[192] [193] 60, 15. wátch spuni'-uapka; wátch refers to *one* horse only, for the verb spuni', to transfer, is used of one (living) object only; shăwána is: to give *many* objects. "Not even one horse your wife has to give to you, if she leaves you; but if you leave her, you must give her several."

[177] [595] 60, 17. láp snawă'dshla. Polygamy was abolished by the headmen of the tribe shortly after the establishment of the reservation, and this ruling was one of the greatest benefits ever conferred upon that tribe by the progress of civilization. But those who had several wives then were not compelled to dismiss all but one, and so in 1877 two or three men were still polygamists. The irascible and excitable disposition of the Modoc and Klamath females must have produced many chin-music intermezzos with their husbands at the time when polygamy was predominant.

[193] 61, 3. K̲á-i mí'sh etc. In this paragraph, in: k̲í'tgik, káktak, hémkanktgik, gitkik, the terminal k contains the abbreviated gi, which joined to the foregoing nû, n means *I said*. The construction runs as follows: Hû'nk ni gi k̲á-i mish k̲í'tgi; nánuktuanta káktak gi píla m's n hû'nk hémkanktki gi; nă'-ulakt gí'tki i snawă'dshash tchí'sh káktak gi píl. K̲á-i etc.

61, 6. tchík. This particle does not mean *if*, but cannot be rendered *here* (and below) with a more appropriate word. It is identical with tchĕk, *then*. A subordinate clause is here expressed by a co-ordinate one. Cf. 61, 9. 10. 12. 62, 4.

[192] [193] 61, 6. któktatska: "we clip their hair in every instance", is the distributive form of któtchka, któtska, occurring in 58, 16.

61, 9. Tsúi etc. This inverted sentence has to be construed as follows: Tsúi tchish nâsh hishuaksh wutódshish snawă'dsh m'na pă'n hû'nk snúkp'la, tsúi nă'-ulĕkan etc.

Húmasht laláḵi né-ulakta Ḵaḵáshash.

DOCTOR JOHN TRIED BY THE CHIEFS.

Obtained in the Klamath Lake Dialect.

I. ACCOUNT OF DAVE HILL, SUBCHIEF.

plied, for Minnie sending to interpret the agent for conversing with.

NOTES.

64, 1. In September 1877 Púkish, an elderly Indian, died after a very short illness on the western side of Upper Klamath Lake. The rumor that he had been bewitched and thereby feloniously killed by K̲ák̲ash, one of the conjurers who treated him, soon gained credence, and the excitement in the tribe ran high. The first account of the occurrence was obtained by one of the subchiefs, who, with his colleagues, passed sentence over the unfortunate K̲ák̲ash.

[192] [193] [551] [769]

64, 1. hû't, "this one", forms one of the substitutes for names of deceased persons, which no Indian dares to pronounce. Hû't refers to a person standing visibly *before* the speaker, and it is remarkable that the dead are referred to by this pronoun, and not by a pronoun marking distance out of sight, like hûkt, hû'kta etc. Cf. hû't híshuaksh, 64, 9., gén, 64, 2., hû'nk pí'sh, 64, 5., 68, 11. etc The subject nánka kukíaks does not exclude the use of the subject pronoun sha, *they*, the account being worded in the conversational style.

*539 683 [551] [756] **64, 1.** Tetĕmádshish or Aunt Susie is one of the numerous female "doctors", who eke out a scanty living from some patients of the Klamath Lake tribe. She received the above name for having been a washerwoman to the soldiers stationed at Fort Klamath, and the nickname Wúya-ak was bestowed on her on account of her predilection for small sucker fish.

64, 2. sämtsálya. The means employed by her to discover that Dr. John had cast upon the patient a spell of a deadly character, were the singing or recital of tamánuash songs, and the *dreams* which she had on that subject. Her tamánuash songs had *seen* those of the accused conjurer. See 65, 9. The great majority of the tribe still believes in the possibility of witchcraft.

64, 7. The two sentences contained in this line anticipate the result of the whole trial, and the popular verdict. The proper place for them would be after 65, 15.

64, 9. Tuá ni etc. The defense made by Dr. John in his own case is not an unable one, nor is it devoid of oratorical powers. But if the arguments were delivered in the order as given by Dave Hill, they ought to have followed each other in a more logical order to attain their full effect.

64, 10. wák lish etc. The logical connection existing between this sentence and the foregoing has to be supplied by: "why should he have been my personal enemy?"

[192] **64, 10, 11, 15** etc. i, ik stands here for ät (*ye*); because, when the headchief is addressed in council, all the others are addressed also. Lóli stands for lóla i. The trial took place on Williamson River.

64, 13. kúkamtchish. The distributive form is used here instead of the absolute verbal k'mû'tchish, because old age comes on *gradually, by degrees.*

64, 16. tchî inah instead of tchî nish; the language likes juxtaposition of two short equal vowels, even when a metathesis is required.

65, 8. Kátak etc. Aunt Susie's opinion, given just after Púkish's death and some time *before* the trial, did not fail to have a striking effect on the superstitious judges and tribe, for her arguments perfectly agree with the national ideas. But to us the arguments seem so weak, that no conviction seems justified, if not based on other evidence.

65, 9. nä'usak etc. "Your defense does not disprove any of the points advanced against you."

[192] **65, 11.** K'mukámtsam nä'-ulaks: "the old customs of the people."

[124] **65, 16.** The second account of this tamánuash-case was obtained a few weeks after the trial; Dr. John was present at the agency buildings at the time of the dictation, furnishing the facts to my informant.

[697] **66, 4.** ká-ishnank etc. This underground jail was in such an unhealthy condition that Dr. John could not have lived in it through the tenth part of his long term of imprisonment.

[625] **66, 5.** Tchikéskni and Skélag, names of two watchmen (i-álhish); the chiefs appoint watchmen from time to time. Skélag is "the young weasel" and Tchikéskni "man living at Tchikési camping-place". They were armed with pistols to foil any attempt at escape.

[192] **66, 10.** nä'dshek for nä'dsh ak: "the only one". Compare nádshiak, 60, 21; waitak, 56, 7. and *Notes.*

[192] [193] **66, 12.** shishi'tilatk. The past participle often stands for forms of periphrastic conjugation: shishítilatko gi, they *were* carrying in their dress. Cf. illólatko, 55, 20.

*539
683
[192]
[193]

68, 13. gé'hlaptchapka. The verb gelápka means to step on, to mount, ascend; with 'h infixed, to mount upon something by using one's hands; ge'hláptcha is to perform this while on the way, while going or travelling; gé'hlaptchapka, to perform this at a distance from other people and unseen by them. Doctor John escaped, aided by his son, in the midnight hour.

68, 14. m'na únakam gatpĕnótash. Gatpĕnóta is a derivative of gátp'na with a durative signification, the suffix -óta pointing to an action performed while another is going on. "His son having arrived close by, while he was imprisoned."

68, 16. shnû'ntatka, verbal intentional of shnû'nta, the suffix -tka being sometimes substituted for the usual -tki, -tki gíug.

PUNISHMENT OF MANSLAUGHTER THROUGH WITCHCRAFT.

tchí'shtal,	tsúi	sa	lúluksla	mák̲laks.
to (his) lodge,	and		cremated (him)	the people.

NOTES.

68, 1 etc. This is a pretty good illustration of the method of doctoring by suction adopted in similar tamánuash cases. Persons sent out to call for the conjurer do not enter his cabin, but loudly halloo outside till he appears; in this instance he is supposed to sing his medicine songs amidst the solitary wilds of the mountain slopes.

192 177 68, 1. mû'ntch-gi'tk. This temporal adverb places the mode of punishment described by the informant among the *ancient* customs of the people. Compared to what is stated here, the trial of Doctor John shows a material modification in the dealings with suspected conjurers, attributable to the influence of the white population.

192 193 68, 1. 10. salχíta is always used in a passive signification, "to be afflicted with the tamánuash spell or bewitching power", which conjurers can send out at will.

68, 1. 2. The words inclosed in quotation marks *anticipate* all that follows up to 68, 10.

68, 2. 8. a-i. This particle has the signification: "undeniably, evidently".

754 68, 5. shû'ta hû'nk. The "working" of a conjurer on a patient's body consists in rubbing, pressing, magnetizing, in blowing on it, and in pouring water over the face or 753 other parts. Sucking out the object which caused the disease is of course the principal operation called for to effect a cure.

68, 5. mû'ns; it is not stated whether this hánshish was a frog, a worm, a small stick, or any such thing; this is immaterial, for the Indian strictly believes that the article was removed from the patient's body and that it caused the disease.

192 68, 6. hántsantking and 68, 8: shúkpaltaking stand for hántchantki gíug and shukpalítki gíug; cf. shû'kpĕli.

68, 6. hántchipka properly means: "he sucks towards himself"; husatchipgápĕle 192 193 "he throws up again to himself"; viz. into his mouth, so as to be able to take it out with his hands.

68, 7. lútatkish is the conjurer's assistant. His office is to repeat his tunes or speeches before those present in the lodge, to expound or explain his sayings, to start songs and tunes in his stead, and to perform such manipulations as mentioned here.

68, 8. k̲'lä'ksh, contracted from k̲'läkápkash, the dead, the deceased; k̲'lekápkash telshámpka, to be on the point of death.

192 68, 8. tché-ulχa: he rises from his seat on the ground, or on a blanket near the patient's couch, for the purpose of leaving.

756 69, 1. hushtsóχa. The killing of a doctor or doctress by the relatives of the patient who died under his or her treatment was nothing unusual in the Columbia Basin until quite recently. In some tribes the third failure in curing brought certain death on the conjurer, especially when he had received his reward in advance.

ăt tsuínuapk; túnepni ăt nûtísh tsuí'nuapk. At tchish híhashnaksh ksíu-
ye must sing; at five ye fires ye have to sing. * Ye too (women and) followers begin

laktampka lítstakiank; untsă'g nă'tnag pá-uapk tû'm mbû'shant. "Sílalsh
to dance with exertion; by and by then ye shall eat plenty to-morrow. "Disease

mat nă'bakuapk" kíuks ná-asht shápa, yayayá-as mat ná-asht sápa; "kû't-
will come on" the shaman thus says, some tamánuash-medicine (to him) "it is so" says; "of small-

kaks mat síssalaluapk" yayayá-as mat ná-ast sh[illegible]a. Suássuaktch mák-
pox it says will suffer (the people)" the tamánuash just so says. Are weeping peo-

laks nánuk wussóga kû'tχaks. Ná-ast kíuks wálok sápa: "Tánni ílksh
ple all afraid of smallpox. So the shaman before sweating speaks: "How many food-buckets

shă'tu ăt? tánkĕni at í'lksh? Lápni tá-unepanta pă'n túnep pé-ula;
do ye count? how many already baskets! Twice ten and five;

kánk a ní să'tû."
so many I count."

NOTES.

70, 1 etc. This is a fair specimen of the careless, jargon-like conversational style in vogue among the É-ukshikni, and without commentaries and glosses it would be impossible to get at the true meaning.

751 These directions are intended to gather the people at the communal dance-
house for a dance lasting five nights. The dance is performed around the fires with
almost superhuman exertions, in order to produce profuse perspiration and to prevent
192 thereby any infection by disease. The conjurer or shaman is charged with the inaugu-
ration of all dances, most of which are of a religious character. This kind of sweating
is called "wála", while sweating in a temazcalli or sweat-house is "spúkli". The kíuks
is introduced as speaking all these words. The particle mat indicates that the words
given are those of another than of the narrator.

192 70, 1. waitólat; in common parlance: túnepni waítash gí'ulank, or: túnepui gíulank, or in Modoc túnepni waitólan.

796 70, 1. kshíulaktcha different from ksíulĕχa; see Grammar (List of suffixes). These dances take place in winter time and are held from two to four times every season.

562 888 70, 2. wewală'ksh. This is one of the festivities from which old women are not excluded; they often take part in the dance themselves.

*539 755 70, 2. í'lks (from élχa, ílχa, *to lay down*) is the full dish, basket, or bucket (kála), on which the victuals are brought in; but it means also the food itself, and the dance-feast on which they are eaten. Locative case: í'lksat.

192 70, 3. shuína is often incorrectly pronounced tsuína.

194 70, 3. nutí'sh; verbally: while burning fivefold; while five fires are blazing.

70, 3. At tchí'sh: the young men, who strip themselves naked down to the hips during the performance, begin their dance after the women have had one turn.

192 70, 5. nä'bakuapk: see népka, in Dictionary.

193 70, 5. yayayá-as means a certain tamánuash witchcraft which inspires the conjurer: the conjurer tells the people just what (ná-ast) the yayayá-as said to him.

70, 6. 7. *s*, *sh* is here in three words doubled to *ss*: shíshalaluapka, shuashuáktcha, and wusóga; kû'tχaks forms the indirect object of the first of these verbs.

192 70, 7. wálok sápa. The kíuks gets the inspiration from the yayayá-as only after sweating; then he can tell (sápa) the people, *when* the disease will come.

70, 8. tánkēni: after tánkēni at i'lksh supply ítpa? (did ye bring in?).

70, 8. 9. shä'tu, sä'tu for the more usual form shä'tua; pä'n after tá-unepanta is incorrect and unnecessary; this conjunction should stand there only after ta-unépni or tá-unep.

for eating out.	

NOTES.

*539 755 71, 1. shuákia does not mean *"to call on somebody"* generally, but only *"to call on the conjurer* or medicine man".

71, 2. wán stands for wánam nī'l: the fur or skin of a red or silver fox; kaníta pi'sh stands for kanítana látchash m'nálam: "outside of his lodge or cabin". The meaning of the sentence is: they raise their voices to call him out. Conjurers are in the habit of fastening a fox-skin outside of their lodges, as a business sign, and to let it dangle from a rod stuck out in an oblique direction.

71, 3. tchélχa. During the treatment of a patient who stays in a winter-house, the lodge is often shut up at the top, and the people sit in a circle inside in utter darkness.

[193] [192] 71, 5. liukiámnank. The women and all who take a part in the chorus usually sit in a circle around the conjurer and his assistant; the suffix -mna indicates close proximity. Nadshā'shak qualifies the verb winóta.

[192] 71, 5. tchûtchtníshash. The distributive form of tchû'tna refers to each of the *various* manipulations performed by the conjurer on the patient.

71, 5. mā'shish, shortened from mäshípkash, mā'shipksh, like k̲'lä'ksh from k̲'läkápkash, 68, 8.

[193] [192] 71, 6. 7. There is a stylistic incongruity in using the distributive form only in kukuága (kúe, *frog*), káhaktok, and in nshendshkáne (nshekáni, ndshékani, tsékani, tchékĕni, *small*), while inserting the absolute form in wishinkága (wíshink, *garter-snake*) and in k̲áko; mû'lkaga is more of a generic term and its distributive form is therefore not in use.

71, 7. káhaktok for ká-akt ak; ká-akt being the transposed distributive form kákat, of kát, which, what (pron. relat.).

[192] 71, 8. lgû'm. The application of remedial *drugs* is very unfrequent in this tribe; and this is one of the reasons why the term "conjurer" or "shaman" will prove to be a better name for the medicine man than that of "Indian doctor".

71, 9. kû'tash etc. The conjurer introduces a louse into the eye to make it eat up the protruding white portion of the sore eye.

KÁLAK.

THE RELAPSE.

always	was well again.

NOTES.

[192]
[193]

72, 1. náyäns hissuáksas: another man than the conjurers of the tribe. The objective case shows that mā'shitk has to be regarded here as the participle of an impersonal verb: mā'sha-nûsh, and mā'sha nû, it ails me, I am sick.

72, 1. kálak, relapse. Relapse is not substantive, but adjective in the sense of a person having fallen back into the same disease by which he was afflicted before; kálkĕla, to fall sick.

[533]

72, 2. yá-uks is remedy in general, spiritual as well as material. Here a tamánuash song is meant by it, which, when sung by the conjurer, will furnish him the certainty if his patient is a relapse or not. There are several of these medicine-songs, but all of them (nánuk hû'k shui'sh) when consulted point out the spider-medicine as the one to apply in this case. The spider's curing-instrument is that small piece of buckskin (ubá-ush) which has to be inserted under the patient's skin. It is called the spider's medicine because the spider-song is sung during its application. A spider-song in use among the Modocs is given below.

73, 5. hä'näshish appears as the subject of an incantation song in the song-list of Sergeant Morgan.

73, 5. gutä'ga. The whole operation is concealed from the eyes of spectators by a skin or blanket stretched over the patient and the hands of the operator.

73, 5. kiatéga. The buckskin piece has an oblong or longitudinal shape in most instances, and it is passed under the skin sideways and very gradually.

73, 7. tánkĕni ak waítash. Dave Hill gave as an approximate limit five days' time.

[226] Gáptsēlam shináktishtka udsáksalsha K̲ók̲ētat, kä'shla sa.
In the ring-finger month they take large suckers in Lost River, (and) get ipos.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

NOTES.

*539 221 This text intends to give a sketch of the various occupations of the northern tribe or É-ukshikni in every month of the year, and is partially worded in a form which may be called dramatic. These statements are not always arranged in logical order, but a profusion of ethnologic details gives intrinsic value to them.

[805] The months of the Mák̲laks year do not coincide with the months of our calendar, for they extend from one new moon to the next one, and therefore should be more properly called *moons* or *lunations*. Twelve and a half of them make up the year, and they are counted on the fingers of both hands. The first moon of their year begins on the first new moon after their return from the wókash-harvest at Klamath Marsh, which is the time when all the provisions and needful articles have been gathered in [796] [224] for the winter. Work is then stopped and the communal dances begin, the doctor-dances as well as those conducted by the chiefs, and everybody participates in them except those who are out hunting in the mountains during the latter part of the year. This mode of counting the moons on the digits was once popular, but on account of its imperfections it is now forgotten by the majority of the tribe. Instead of it they reckon time by the seasons in which natural products are harvested, as: udsaksä'mi, "in the big sucker time"; i-umä'mi, "in the berry season", or they use our calendar months.

The first moon mentioned in our text, gáptche, answers generally to our May. The two next moons are counted on the thumb and forefinger of the hand not used immediately before; with this last moon their year has come to an end. The next five moons are counted again on the digits of the first hand, and so forth. The half moon making up their full year is not accounted for in this text.

[823] [226] 74, 2. Ktai-Túpakshi is a locality of renown in the folklore of the Klamath tribe. It lies near the confluence of Sprague and Williamson Rivers, on the property of an Indian named Tchéloχins. The otílks is the fish-dam (from utíla), where the Indians wade in the water with their dip-nets and catch the fish while it ascends the river in spring-time in enormous quantities. This fish-dam does not reach the water's surface.

[193] 74, 2. The direct object of lúela is kápto, its subject mák̲laks hö'ank.

74, 3. kámalsh pahá means: they dry the fish which they have just caught by exposing it to the sun on limbs of trees, and then make kámalsh by pounding it. Kámalsh is a derivative from gáma, to pound.

[192] 74, 3. kó-iχaga is identical with gúikaka; derived from kúi, "away, far off"; gui-χátchka is: to start out annually to the prairies where roots etc. are harvested.

[262] 74, 5. saká a pö'ks: they eat *sometimes* the camass raw, but only at the time when [222] digging it. Bulbs, roots, pods, chrysalids and berries are gathered by women only.

[251] 74, 6. pahá at p.; this is equivalent to pahátko pö'k̲s iwídshat. They bake the camass and put it in their cachés at the place where they intend to stay next winter.

[796] 74, 8. shníkanua. During the time when a pause is made in the gathering-process, [222] the conjurer carefully watches the ripening of the pods not yet harvested and arranges public dances. When the sun has done its work, he solemnly announces it to the [192] women, and they go to work again in their canoes.

[415] 74, 9. shiulína. From the preceding we should expect shiulínat, lulínat.

74, 10. wíllishik is the generic term for larger kinds of provision-sacks; it means here a sack of fifty pounds seed or grain, while the wáχoks holds hundred pounds. In pálasham-wáχoksh, however, the latter word is taken in its *generic* sense of sack, bag.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 221 [192] All these different kinds of sacks or bags were originally made of bulrush-stalks (tule) and the táyash was made of straw.

[415] 74, 11. ka̱ítua nû kä'ila. The sense is incomplete. Probably sháyuakta is left out: "I do not know of any in the whole country", käíla often standing for käílatat.

[192] 74, 14. áwalues. There are several islands in the shallow waters of the vast extent of Klamath Marsh, but only *one* is meant here.

[103] 74, 15. wö'ns ílktsat. They submerge their dug-outs at several places on the beach, where they are certain to find them in the next wókash-season.

[501] [103] 74, 17. pi'la wi'hla (or píla wíllash) contains perhaps a proper name of a locality, or stands in connection with Tóilkat, "at the Rail-Pyramid"; wílhaslash means top, apex. The stations from the "Ford" to "Bird's Lookout" are passed by the tribe when they return home with the lily-seed harvest-crop. "They drop the rifle" is: they take a rest. All these localities are either on the open waters of Klamath Marsh or on Williamson River, which forms its outlet.

[484] [492] 75, 1. iwí-idsha wókash. The distance between Klamath Marsh and the Williamson River is from 20 to 25 miles, and horses carrying wókash can make it in one day. The next day they return to carry another load.

[482] 75, 2. nátoks waítuapk: we will lie over one day to let our horses rest, or recover from the swellings on their backs. Nátoks stands for nát toks.

[824] 75, 5. klá-ads is probably a kind of wild prunes. See Dictionary: këlátch.

[192] 75, 8. wídsika íwam. "Some are economical with their own berries, and prefer not to scatter them in the hands of others"; íwam, huckleberry, has become the generic term for all berries, and i-umä'mi is "*berry-season*".

[316] 75, 11. spû'klish here means the large communal sweat-house; it is used frequently for dances and kshiuwálχishtat, contr. kshiû'lχishtat might stand instead of spúklishtat.

75, 11. papiä'na, vocalic dissimilation for papa-éna; derived from pán, to eat.

[193] 75, 13. ati'sh etc. "Heap ye up that hay in two stacks, which must have a lengthy, long-stretching, and not a high, cone-shaped form!" For heaping up long stacks one verb is here used, and another for making the high, round ones.

PŬ'LAM SHUMSHE-ÉLSHTAT SHASHAPKË́LÉASH.

A SKETCH OF BALL'S MARRIED LIFE.

[115]

GIVEN BY DAVE HILL, SUBCHIEF, IN THE KLAMATH LAKE DIALECT.

*539 593

Póluk ka̱'liak snáwäds t'shín. Tsúi snawä'dshla Pámpiam pä'-ia lupí';
Ball he without a wife grew up. Then he married Pámpi's daughter at first;

tsúi wä'kala, tsúi tatá mántsak mbusä'lan gí. Tsúi kä'tsa, tsúi mbusä'-
and she had a babe, and then quite a while he lived with (her). Then he left (her), and lived with

alpëli pän, tsúi pän kétsa sissû'kuk tsû'ssak. Násh wä'ka sham kla̱ká, nä'sh
(her) again, and again left (her) quarrelling continually. One babe to them died, another

marrying lived.

Wakák tsik sa tchía, k̲á-i ní tû'měnat.
How since they have lived, not I learnt.

NOTES.

[178]
[837]

Matrimonial reverses like the one given in this narrative are by no means uncommon among the Klamaths of the present day. They are one of the unavoidable consequences of the gradual emancipation of the females from the former rule of their brutal husbands through the advent of the whites, and also of the obnoxious and corrupting neighborhood of the soldiers at Fort Klamath.

*539
593
77, 1. The name Púl is pronounced in very different ways, and most people think it is the English name Ball; Póluk is Pŭ'l hŭ'k; tchía, "lived", would be preferable to t'shin in this connection.

[192] 77, 2. 3. kă'tsa, kétsa properly means to cast away; here: to abandon, leave; almost identical with wutódsna occurring below, 78, 2.

77, 4. săwána sas: he did not give many horses for her to her parents.

78, 8. pállank sas. This shash properly refers to Pámpi and his family, for Púl's wife took the dug-out canoe of Pámpi and rowed with it to the soldiers. This was in the northeastern part of Upper Klamath Lake, and occurred in the winter of 1876–'77.

[103] 78, 13. É-ustat is the location of the old agency buildings at Koháshti, in northeast corner of Upper Klamath Lake.

[192] 78, 14. hí'-i. On that occasion Ball left his wagon in the midst of the woods; hi, hí-i means "on the ground".

[657]
[692]
[697]
78, 15. nă'ulχa sha pă'n. About the middle of September 1877 a strong escort of Indians brought Ball and his wife to the "law-house" at the Klamath agency to be tried by the chiefs. A delay of several days occurred before he was confronted with the judges, and during the time he was imprisoned at the "skúkum-house", a strong log cabin at the agency serving as jail. He is still a very young man, and on being brought there he was allowed to ride on horseback with a rifle on his shoulders. His father is an Indian from the Spokane tribe, and Spúkăn is his name.

[192] 78, 16. sχókta, to pay a fine; to be fined (by the chiefs). See: "Legal Customs", 62, 5.

GAMES OF THE KLAMATH LAKE PEOPLE.

chase each other	to the bases	they	then.

NOTES.

193
192

I. The game described in this paragraph is played with four shúlshesh-sticks. From this term is formed a denominative verb, shulshéshla: to play the stick-game. It is a guessing game, and the guesses are made known by putting fingers forward, a gesture which is called spélshna. Hence spélshna, sometimes corrupted into spéldshna, is used as a term equivalent to shulshéshla, to play the stick-game; and a third verb for this pastime is shákalsha. More minute descriptions of the three games will follow elsewhere.

79, 1. shi-i'χaga is the reciprocal form of i'χaga *to win, gain*, occurring below. These terms mainly refer to gains made in gambling.

79, 2. shulshéshlank stands here for the periphrastic shulshéshlank gi, or the simple shulshéshla. Derived from shúlshesh, and this from shúla, to hand over, to pass to another.

79, 2. sχû'tash, not to be confounded with skútash, *blanket*, forms apposition to lápi udshekáne. The two slender game-sticks are wrapped in narrow strips of buckskin leather (skúta, to wrap in).

*539 79, 3. sχétcha, to extend two fingers, viz. the index and the middle finger; the instrumental case of the verbal substantive, sχétchashtka: by extending these two fingers.

525

192 79, 3. shlín, to shoot, to shoot forward, to hit; figuratively used for the rapid motion of the hand in guessing at the location of the sticks lying under the tray or pá'hla. yû'shakna, yúshkēna, or yû'sχa, to put forward, to use the index finger. In this game that finger is called yû'shχish, and not by its usual name, spéluish.

193

79, 4. vû'ish is the location of the thicker sticks coupled on one side, and of the thinner ones on the other; the gesture for guessing at it is to make a side motion with the hand, thumb included. In the text, the sense would become clearer by wording it thus: vû'ish sha népatka tχopowátka tch lénank shlín, "they guess at the vúish, whirling around with the hand, thumb included." Léna is to perform a circular motion; klátchna, a side motion.

79, 5. sχétchashtka sha láp wí-uka. Sχétchashtka collides here apparently with yû'shχish spélshisht; it seems to stand for: "they win two checks, if they have guessed right at the slender sticks".

79, 5. wí-uka. They win one (nā'shak) of the six checks or counting-sticks, if the party opposite did not guess correctly.

II. To play at dropping beavers' teeth (shkû'sha) is the subject of this paragraph; the game itself is skúshash. The four teeth of the beaver are marked for this game by the incision of parallel lines or crosses on one side, and a small piece of woolen or other cloth is inserted into the hollow to prevent breaks in falling. The two longer or upper teeth of the beaver are called the *male* (lakí), the pair of lower and shorter the *female* teeth (gúlo, kúlu; distributive form: kúkalu). The teeth are dropped on a hard, level substance, as a metate or grinding stone, to make them lie flat. The marked side of the teeth wins, if it is turned up after dropping. The teeth of the woodchuck (mú-i, mói) serve for the same purpose.

80, 2. Shúshmalua-kípksh stands for shúshmaluash-gípshtka or -gípkashtka, the instrumental case of the participle gítko, possessed of: "(if they fall down) on that side, where each is possessed of marks" (shúmaluash).

80, 2–4. kshē'sh. In this game of beavers' teeth (púmam tút), or woodchucks' teeth (múyam tút) they use twelve check-sticks to count their gains with. The game is played by two persons, or by two partners on each side.

80, 5. Kshawínasht tûksh. Kshawína means several teeth to fall down, but, as the prefix ksh- indicates, only *one* tooth with the marked or winning side up.

III. The tchimmá-ash game is played almost exclusively by females. The tchimmá-ash is a string about 2–3 feet long, to the ends of which sticks or pieces of cloth are tied; it is taken up and thrown forward by two flexible willow rods (shuékûsh, wá'hlkish) to playmates, who divide themselves into two parties. Before the commencement of the game, two limits (yúash) are meted out on the ground, which serve as bases. Both of them are located between the lines of starting (shalχuétgish).

80, 7. shuékûsh: *two* poles; players hold one of them in each hand.

80, 8. Kawû'tank refers to the playmates of the opposite party, who are bound to catch the flying tchimmá-ash.

80, 11. shiwákuash seems to be a dissimilation of shiwáka-ash.

80, 11. kíudshna léna, or better: kíudshnank léna.

they make. On going home they heap up into cairns small stones in remembrance of the
kápkash, ktá-i shúshuankaptcha í'hiank.
dead, stones of equal size selecting.

NOTES.

No Klamath or Modoc sweat-lodge can be properly called a sweat-*house*, as is the custom throughout the West. One kind of these lodges, intended for the use of mourners only, are solid structures, almost underground; three of them are now in existence, all believed to be the gift of the principal national deity. Sudatories of the other kind are found near every Indian lodge, and consist of a few willow-rods stuck into

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539
343
515
765
[193]
[192]

the ground, both ends being bent over. The process gone through while sweating is the same in both kinds of lodges, with the only difference as to time. The ceremonies mentioned 82, 4–13., all refer to sweating in the mourners' sweat-lodges. The sudatories of the Oregonians have no analogy with the *estufas* of the Pueblo Indians of New Mexico, as far as their construction is concerned. Cf. *Notes* to 70, 1. 75, 11.

82, 1. lápa spû'klish, two sweat-lodges, stands for two *kinds* of sweat-lodges.

82, 5. shashámoks-lólatko forms *one* compound word: one who, or: those who have lost relatives by death; cf. ptísh=lûlsh, pgísh=lûlsh; hishuákga ptísh=lúlatk, male orphan whose father has died. In the same manner, k̲ĕlekátko stands here as a participle referring simultaneously to híshuaksh and to snáwedsh wénuitk, and can be rendered by "*bereaved*". Shashámoks, distr. form of shá-amoks, is often pronounced sheshámaks. Túmi etc. means, that many others accompany to the sweat-lodge, into which about six persons can crowd themselves, bereaved husbands, wives or parents, because the deceased were related to them. Cf. lĕ'pk̲'leχa, lĕ'pk̲'lekatko.

82, 6. Shiúlakiank etc. For developing steam the natives collect only such stones for heating as are neither too large nor too small; a medium size seeming most appropriate for concentrating the largest amount of heat. The old sweat-lodges are surrounded with large accumulations of stones which, to judge from their blackened exterior, have served the purpose of generating steam; they weigh not over 3 to 5 pounds in the average, and in the vicinity travelers discover many small cairns, not over four feet high, and others lying in ruins. The shrubbery around the sudatory is in many localities tied up with willow wisps and ropes.

82, 10. Spukli-uápka mä'ntch means that the sweating-process is repeated many times during the five days of observance; they sweat at least twice a day.

LUÁTPÎSHLA SNÉWEDSH M'NA.

LAMENT OVER A WIFE'S LOSS.

the song-repeater	too,	bewailers,	listeners	also	enter	lodge	his.

NOTES.

[178] The ascetic performances and ceremonies here described are going into disuse at the present time. When they were fully observed, the bereaved husband wandered alone through the woods and wilds (spótu) for five days, but to the widow these observances extended over a shorter time. For this purpose both sexes wore warm clothing, but took to worn-out blankets or old articles of raiment, and used wisps of the serviceberry-bush as belts.

[192]
[526] 83, 1. shpótû: strong and unusual bodily exercise, running up hill, plunging etc. was and is still considered beneficial to the body, and is much in favor with the Indians. Cf. 82, 10. 11.

[192]
[193] 83, 1. hissuáksûk for híshuaksh ak; the husband *alone*, not in company of others; pä'nē for pä'n a, pēn a, cf. átēnen for át a nen; and sē for sha, they, 82, 4.

83, 2. ka-ítua pát or p'át: he eats nothing at the time while wandering; pánk, p'ánk might stand here instead of pát; tû'tahna: for dozing they did not lie down, but tried to catch a little sleep while walking and wandering.

83, 2. shlaá, and tchákēle 83, 5, forms sometimes used in conversation instead of shläá, shleá; tchä'kēle, tchékēli. Cf. yáka for yä'ka, yéka: *Note* to 16, 10.

83, 3. hûshtí'ktamna; the suffix -tamna shows that pahín stands for nánuk pahí'n gí'sh: "nightly, every night."

83, 4. siunō'tish and shuí'sh are both tamánuash-songs, but of a different character. See Dictionary. Shlä'popka: he sees in his dreams what he has heard mentioned in the songs. To sing or repeat songs started by the conjurer devolves almost exclusively on the women present at the ceremony.

83, 5. súmat: into the mouth; their blood, disturbed by the constant excitement produced by the night rambles, ascends to the throat, and is sometimes spit out by them.

84, 2. shuashuáktchish. By their loud and noisy lamentations (shuáktcha, to cry, to weep) they expect to avert from the bereaved husband the effects of the tamánuash-spell (shuí'sh) which he has seen in his dreams.

84, 2. matchátgish: those listening to the words uttered by the conjurer and his repeater or expounder; they are of both sexes and also act as bewailers.

CREMATION OF THE DEAD.

OBTAINED FROM J. C. D. RIDDLE IN THE MODOC DIALECT.

right there them they buried; some from afar bringing (them) at this very spot again they buried.

NOTES.

* 539 764 Cremating the dead is a practice which was abolished by the chiefs on the territory of the reservation in or about 1868. At the Indian graveyard north of the Williamson River a hill of 12 feet altitude, where the corpses of Indians of the Klamath Lake (not Modoc) chieftaincy were burnt, is still visible and untouched since then. With the exception of the sentence from Skentanápkash to ítpa, the first paragraph refers to the present as well as to the former mode of funeral, while the second describes [171] the ancient mode of cremation. Cremation prevailed also among the Snake and Pai-Uta Indians, living in the vicinity of the Mák̲laks; cf. Dr. W. T. Hoffman, Pahute Cremation; Cremation among the Digger Indians, in Proceedings of the Am. Philosophical Soc., Philadelphia; vol. XIV, p. 297 sq., 414 sq., (1876). According to Stephen Powers, cremation prevailed among the Pomos of Northern California, west of the Sacramento River, and the Erío, a tribe living at the mouth of Russian River, believe that all deceased Indians will become grizzly bears if not disposed of in this manner. The Indians inhabiting the shores of Middle and Lower Columbia River placed their dead on platforms erected on hills, or into the canoes of which they had been the owners; the Kalapuyas on both sides of the Willamet River buried their dead by inhumation.

000 Our notice makes no mention of the mourning ceremony among the Modocs, by which widows had their long hair cut off at the funeral of their husbands, then dripped the resin from the pyre, liquefied by the heat, upon their bared heads, vowing not to marry again before this ghastly head-cover had worn off by length of time. The Modocs cremated their dead on any day *from the first* to the fifth day after decease, according to choice.

*539 764 [801] [171] 85, 1. ţutenépni. Here we have again the sacred number five occurring so often in the traditions, myths and customs of the Oregonian tribes. Cf. 70, 1. 3. 82, 6. 88, 4.

85, 1. Instead of ídsha may be used Klamath Lake ílχa (*or* éna) lulukshåldshuk, to bring out for cremation. The northern dialect uses vumí only in the sense of putting dried provisions into the ground. A funeral is ílktcha in the Modoc dialect.

85, 2. shutédshna: they remove obstacles upon the road or trail, such as fallen trees or logs; they clear the passage. kíflatat means here the same as tchpinû'tat, 85, 4.

[192] 85, 2. wawaíha. Another form of the verb waíha is said to exist in the Modoc dialect: wawaíha; its distributive form: wawawaíha.

85, 3. itpanŏ'pkasht is the synizesis of itpannápkasht.

85, 6. Tánkni; the term mā'ntchni is often used instead.

85, 7. ánko for ánknam kedshlákstat.

85, 10. pítchash for Klamath Lake pitchkash, "until it has gone out".

85, 11. Modoc hibéna or ipéna for the Klamath Lake yépa, yépona: to dig a hole.

85, 11. néwisht. Of this term the original meaning seems to be "thrown by hand into the air", a manipulation resorted to by some Indians, though not here, with the burnt ashes of the deceased.

85, 12. lk̲áppa. These piles of stones evidently were, as well as the piles erected on the spot of the burnt lodge, intended as monuments of the deceased. These cairns are of considerable size, and can be seen in the old Modoc country at the present time.

85, 16. pĕn húnkĕlam etc. Pĕn introduces the verb vûmi', and k̲'léka is a verb coordinate to vûmi': "his children die, right there again they bury them."

PRESENT MODE OF INHUMATION.

GIVEN BY MINNIE FROBEN IN THE KLAMATH LAKE DIALECT.

539. Hishuákshash snawédshash gíntak k̲'lĕ'ksht tchúi sha hû'nk bóxtka

for five days. Horses slaves also no longer they bring there

luélkish, m'nátoks sha wátch shéshatui shkútashtat ī'lχûtchlûk.
to kill, but his own they horses trade off for blankets to bury him in.

NOTES.

This short notice describes a funeral (isha) of the Klamath Lake tribe in the mode as adopted from the Americans not long after the treaty of 1864, when cremation of bodies was abolished. Whatsoever of the ancient customs in disposing of the dead is still observed, the reader will easily gather from the present sketch.

87, 3. tálaka means to go forth and back with the hand; hence to rub with the palm of the hand, to rub paint on, to paint.

87, 5. Hä' nen wä'g'n. In this connection they can also say: hä' nem wä'g'n; and for wátchatka: wátchetka.

87, 11. tánktak, in this connection, is a compound of tánkt and ak, not of tánk and tak: "just at that time."

87, 17. láp kímbaks gasháktchna: they follow the corpse, which is placed on the wagon, in two files *on horseback;* kímbaks is apposition to shashámoks.

88, 1. Nā'sh etc. The appearance of their graveyard (tchpínû) near the Williamson River does not differ much from that of our cemeteries; it lies in the midst of the woods. For titadsχátko see Dictionary.

tsúi sha shiū'lgip'l tsóχapksh, tsúi sa ánkuala tū'm, tsúi sa kshū'iwal lū'-
then they collected the fallen, and they cut limbs (of trees) many, and they laid on the pyre to

lukshaluapkug. Tsúi sa nutá hū'k, nánuktua núta; pualála sha hū'nkĕlam
cremate (him). Then they fired it, the whole they fired; cast into they his

tū'kanksh. Stútχishla sha yutátkug; k'lékaht shtútχishla. At hū'k nánuk
quiver. Sorrowfully wept they in mourning; at his death they wept. Now that whole

nátspka tchulä'ks, at sa nánuk gä'mbĕle lólokshaltkuk. Gátpampĕle
was burnt up body, then they all returned from cremating. They came back

tchī'shtat shishásbka sha lák hū'k snáwedsh hū'nkĕlam wenóya; hissuáksh
to homes (and) cut off they hair to wife his, who was widowed; husband

m'na k'léksht wenóya. Shtíĕ shupĕlóka nū'ss wenóyuk, tsúi spúklitch.
her having died she became widow. Resin she laid on (her) head became widowed, then went sweating.

Túnipni spúkĕli, k'lä'wi at; at gä'mbĕle, kiä'm pán. At gä'tak.
Five (days) she sweated, stopped then; and returned home, (and) fish ate. That's the end.

NOTES.

726
825

The style of this little piece is far from what we would call accomplished, and of incongruencies and unnecessary repetitions there are a score. The fight in which the five warriors were killed is imputed to the presaging, night-long cry of an ear-owl, and in ancient times Indians seem to have been justified by universal custom in attacking and killing their neighbors if an owl or raven was vociferating at night in close proximity to the lodge or lodges of these unfortunate people.

192
193

88, 7. hushtsóχok for hushtsóχa húk.

88, 9. 10. hushtsóχa is used here in an active sense, but is better translated by the passive form.

89, 1. kshúiwala has for direct object tsóχapksh, the dead body. For the same operation the verb kshávala, kshával is also frequently used: 85, 6. From here the informant begins to speak of *one* body only, as if only one warrior, not many, had been killed in this battle. Cf. *Note* to 89, 5.

89, 2. húnkĕlam stands in this line for hunkĕlámsham or p'nálam: "their, theirs".

89, 5. lák. After their return they cut off the hair of the widow and then she put pitch or resin on the head. In most tribes they did it *at the time* of cremation, while they witnessed the action of the flames upon the body.

89, 5. húk snáwedsh: one widowed wife only is mentioned here instead of many: "*pars pro toto*"-construction. This sentence, if built regularly, would run as follows: shishásbka sha lák hū'nkĕlam snawédshash, kát húk wenóya; hissuákshash m'na k'léksht wenóya.

89, 7. spū'kĕli, to sweat in the sweat-lodge, viz. in one of the three sweat-lodges given by K'múkamtch to the Klamath Lake people: spū'klitcha, spū'klidsha, to start out for sweating there. Cf. lumkóka and wála. To eat fish only, and no meat, means *to fast* on fish.

184

171

115

With the exception of the first, these ethnographic notices concern the people composing the southern chieftaincy as much as those of the northern.

I. The four items of section I are worded in the Klamath Lake dialect, and were obtained from Frank, a young Indian settled at Kuyamskä'-iksi, "the Crab's River-Trail," on the Williamson River.

90, 1 etc. The census figures given in the first paragraph refer to one of the latest counts made of the individuals in the tribe, probably to that of 1876.

90, 1. vunépni laláki gítko. Correctly worded, this phrase would read vunepä'nash lalák̲iash, or vunépnish, or at least vunépni lalák̲iash gítko.

90, 2. pé-ulatko ought to be used only when units are mentioned after the decads of figures. If the relator wanted to say, 180 men were counted, the verb shä'tni, shétni would be the proper term. Cf. *Note* to 70, 8. 9.

90, 3. Tumántka, "by the many", by the crowd: by the majority of the men in the tribe.

90, 7. hishuátchχash is a form for the word *man, male,* common to Klamath Lakes and Modocs, but more frequently used among the latter. The reverse is true of the form híshuaksh.

90, 10–13. Part first of the fourth notice refers to dances at the communal dance-lodge, organized and directed by chiefs. The chief starts the songs; sometimes the men, sometimes the women sing in chorus; or a song may be sung by all present. When the chief sees one, who does not sing, he cries out: "î tchuín; túla shuín î!" All dances are accompanied by songs or other music.

90, 10 ul probably stands for ûn, û'n, û'na, a conjunction more frequently used in the Modoc than in the Klamath Lake dialect.

*539 90, 11. tchä'lχet for tchä'lχat! sit ye down!

90, 11. 14. wéwalχat, wawálχat. Wálχa means: to look out for, to be expectant; the dancers are commanded to make ready for the next song, which implies that they have to rise upon their feet.

90, 12. tchúinuapk. See *Note* to 70, 3.

[764] [533] 90, 13–15. The words from Slámuapk to k̲'lekápksh are commands of the chiefs or subchiefs heard at the solemn ceremonies held in or around the lodge of a deceased person the day before the funeral. Chiefs are entrusted with the leadership of choruses sung by those who mourn over the defunct, and in presence of the corpse.

90, 13. 14. shlámuapk for shlámi-uapkat, or shlámi-uapk' l! See Dictionary.

II. The items contained in section II were obtained from J. C. D. Riddle, and are worded in the Modoc dialect.

[291] 90, 17. The Klamath Lakes wore a kind of elk-skin hat, wide brimmed, high and painted in colors, which they called púkalsh tchuyésh. Leggings were called kailálapsh, because they reached to the ground (kä́ila).

000 90, 18. 19. Shelóluks and sheshalólish; both derived from the verb shéllu̩al, to make war, to fight.

90, 18. shtétmashtka. All Indian tribes of the border region between California and Oregon are reported to have fought with poisoned arrows in early times.

91, 1. Nkä'kginga, literally: on account of a childbirth. That the father denies to himself the use of meat during ten days is a custom not unlike the world-renowned *couvade;* the sweating has the effect of keeping him at home in such a time when his family stands most in need of his protection.

91, 2. shápěle is flour of any kind of grains and the bread made from such; mák̲laksam pásh, Indian food: edible roots, berries, wókash etc.; lomkóka for the Klamath Lake: spúkli: to sweat in a sweat-house. Cf. *Note* to 89, 7.

91, 3. p'nálam shulótish, the dress which they wore at the time of the childbirth.

91, 4. Tishiwápkash. The Modoc tishíwatko, crooked, stands for Klamath Lake tishílatko, to which compare tikíwatko and tísχantko.

91, 5. k̲alk̲álish. This adjective is variously pronounced k̲álk̲ali and k̲ólk̲oli.

91, 6. In its signification lúlpût approaches very near to lúlpat, as the Klamaths would say; lúlpût, however, involves the idea: she *raises* her hand *up* to the eyes. This manipulation probably contributes to some extent to the oblique convergency of both eyes towards the nose or mouth and approaches the Oregonians to the Mongolian type of mankind. All the manipulations described are frequently repeated by mothers and other females inhabiting a lodge, and they often do it without any necessity.

91, 8. nánuki stands for nánuk gî. suéntchăm: in the Modoc dialect suéntch means a baby, infant, while carried on the baby-board; the Klamath Lakes, however, use this word in its original sense of baby-board, cradle-board, to which the infant is strapped or tied.

91, 10. ktcháyash. The application of insects etc., is certainly done for the purpose of rendering children fearless against danger and unmoved by sudden fright in after-life.

people the Wascoes, then I may go there, being in peril I will not go. Good if to be

túmĕnank génuapka nû.
I hear (them) shall go I (there).

NOTES.

The Wasco Indians form a portion of the Upper Chinook Indians of Columbia River. Their ancient homes were around and at the Dalles, and a few of them still live there, while others now inhabit a section of the Warm Spring Indian reservation on Des Chutes River, Oregon. The Dalles formerly were, and are still to a certain extent, the locality, where all the tribes of the Columbia River Basin sold and bartered their products and commodities. The Warm Spring Indians call the Wascoes: Waskopam, "men of the grass region"; the Klákamas-Chinooks call them Guithlasko. The Klamath Lake and Modoc Indians also were among the frequenters of the intertribal market, exchanging there the slaves caught on their raids for ponies, provisions etc., when they went down to the Dalles on their annual trips. My Indian informant, Charles Preston, had lived long at the Dalles, and also gave me a list of Wasco words and sentences.

567
221

*539
829
192
193
439

93, 1. ká-i spûní vushúk: the subject of spûní, É-ukskni máklaks, is left out by inadvertence. Some Wascoes wanted to marry into another tribe; for "one Wasco man" stands here for "some men of the Wasco people."

93, 3. 4. Ampχä'ni, contraction of ambuχē'ni "thither, where the water is", where the waters rush down in a cataract, or in rapids. The rapids of the Columbia River at the Dalles impede navigation.

93, 7. sasságank i gi! ye are in peril, when going to the Dalles and being Indians, therefore take care of yourselves! i stands for ät; cf. 64, 10 and *Note;* 90, 13. 14.

93, 7. 9. Instead of ká-i nû shtínta may be said also, in this connection, ká-i nû shanáhole; instead of tánkt ni gēnt: gē'ntēni, gē'nt a ni; instead of Tídshi hä'k: tídshäk, tídshi hä gi.

only		was hurt.

NOTES.

This is one of the most popular myths current among the É-ukishikni, and we shall find it partially repeated in another myth, recounted by Dave Hill. Aíshish and his father K'mukámtchiksh represent powers of nature engaged in everlasting strife for mutual extermination. In this myth K'múkamtch resorts to the following trick to destroy his offspring. Seeing young larks in a nest on the top of a sorrel-stalk, he informs him, that if he climbs up there, he can obtain a nest of eagles with all its inmates. Gladdened with the prospect of this capture, Aíshish climbs up, but the insidious father causes the plant to grow miraculously fast under him, so that descent becomes impossible, and Aíshish comes near perishing by hunger and exposure.

In the recollection and wording of some portions of the myth my informant was assisted by "Captain Jim."

94, 1–7. The short fragment of a creation myth preceding the Aíshish tale stands in no causal connection with it, and could as well be inserted elsewhere. Myths entering upon the *details* of the creation of the world by K'mukámtchiksh do not, as far as ascertained, exist among this people, but in their stead we have many myths for special creations (of man, animals, islands, mountains etc.). A grammatic analysis of the terms occurring in this fragment (from Lûpí nä'lsh to pátki gi) was inserted by me in the *American Antiquarian*, Vol. I, No. 3, pages 161–166, under the heading: "Mythologic Text in the Klamath Language of Southern Oregon."

192 94, 1. Lûpí shutäyéga is not to be considered as a repetition, for it means: when
193 K'múkamtch began to create the world he made *us* before he made the fish, other animals, and the dam at Linkville. This is, of course, only a small fragment of all the creation myths of this people.

94, 2. shashapkēlía: to tell or count stories, myths or fables in the interest or for the pleasure of somebody; the i is here doubled to obtain a rhetorical effect.

94, 3. K'mú'kamtchish is a contraction of K'mû'kamtch tchish; Aíshish, K'múkamtch also. The longer form of the name of the deity occurs 95, 20.

94, 3. ká-akt, metathetically for kákat; kát is pron. relat. which, what, the thing which. nánuktua ká-akt gäg comprehends all animate and inanimate creation.

94, 4. wá, uá, to stay, exist, live in; is always connected with an indirect object indicating the place, spot, locality or medium where the subject lives or exists.

94, 4–6. The construction of the sentence runs as follows: Tchúyunk (K'mukámtch) né-ulχa gi'tki gíug páplishash I-ulalóuan, páltki ti'wish gint udûlshámpkash mû' nkillipkash, mû'ash shlé-uyuk; "when a south wind blows, it will stop the waters from
133 rushing down rapidly over the cataract." The outlet of Upper Klamath Lake, called
132 Link River, runs from north to south, over the falls at Linkville; hence a powerful
226 south wind will stem the current of Link River above the falls, leave its bottom dry or almost dry, and enable the Indians to catch the fish swimming in the shallow water or wriggling in the mud. The rocky ledge under the cataract is supposed to be the gift of K'múkamtch.

*539 94, 4. I-ulalónan or Yulalóna is the Indian name of the cascade of Link River
773 above the town of Linkville, and for that town itself. The origin of this name is ex-
192 plained in 94, 5. 6, for the verb i-ulalóna means to move forth and back, referring here
193 to the waters of the river receding under the pressure of the south wind.

[103] 94, 6. ítklank, partic. pres. of ítkal, means here: obtaining by basketfuls.

[137] 94, 9. The kĕnáwat is a plant growing high in the warm climate of Northern California, especially in the ancient habitat of the Shasti Indians, and in this myth it suggested itself to the Indians on account of its property of growing very fast.

95, 5. gé'hlapka: he swung himself into the nest by climbing over the rim. Cf. *Note* to 66, 13.

95, 10. kaiχema K'mukámtchish for the regular form K'mukámtchash. Cf. 91, 8.

95, 15. skáyamtch etc. More plainly expressed this sentence runs as follows: sha skáyamna pásh tchish ámbu tchish; the first tchish being placed before pásh and appended to the apocopated skáyamna.

95, 16. shéwana here used differently from tchíya, which applies to liquids only.

95, 17. p'lû' ítchuank seems to be a quite modern interpolation, for it smells of pomade and hair-oil; but it is as ancient as the myth itself.

[765] 95, 23. 96, 2. 3. 4. Tchíka. I have rendered this bird-name elsewhere by "Chaffinch," and Klétish by "Sandhill Crane".

[551] 96, 3. shlámia, to feel insulted. She resented it as an insult that the child called her deceased husband by name; for it was a capital crime among the ancestors of the present Klamaths to call a dead person's name for many years after his demise.

96, 5. hû'tna is changed to hû'tan on account of being followed by a word commencing with k.

[765] 93, 6. stiya. The custom of widows to put pitch or resin on their heads at the death of their husbands was abolished only at the time when cremation became a thing of the past.

[178] 96, 6. galdsha-ńyank is a more explicit form of the participle; the verb gáldshui being the contracted form of galdsháwi.

96, 8. yámnashla. He used the bristles of porcupines to make necklaces of.

96, 11. unakáka m'na was the son of Aíshish and of the above mentioned Tchíka.

96, 11. 12. K'mukámtcham qualifies pä'ks, not lúlukshtat.

96, 14. pakakóleshtka, verbal desiderative of pakakóla, to jerk away from. The suffix -óla indicates that K'múkamtch wore his tobacco-pipe tied to his body; he wore it on his neck.

96, 15. tchitchiks is used when speaking to children. It signifies *so, so!* and means: be quiet, shut up, stop!

96, 17. tchē'k k̲ĕléwi. In similar connections this phrase very frequently ends a whole narrative in Modoc and Klamath. Here it means that Aíshish ceased to poke the pipe into the fire. Cf. 85, 10. 89, 7.

96, 18. medshá: he removed from that spot with all his wives and children. Ancient customs forbid the offspring to stay where the father had breathed his last.

96, 20. Gén húnk nánuk etc. This portion of the myth describes the destruction of all the living organisms on earth by a general conflagration caused by K'múkamtch. Myths of this kind are suggested by intense heat experienced in summer. This mode of destroying life on earth is less frequently met with in myths than the drowning in a general flood.

*539
773
192
193

96, 21. kinyäga. Aíshish held the tray over himself, his whole family, and his lodge. The same prefix ki- reappears in a nasalized form in nχl'-uliga: 97, 1. It is nasalized there on account of the preceding -k in hû'nk.

96, 23. kaíla. Where I have rendered this term by "world", as here and elsewhere in creation myths and myths of a similar character, it does not signify the whole surface of the earth as known to us, but only that section of country which is known to that tribe of Indians. Thus ancient creation myths only describe the creation of that part of country where these myths originated; the creation myths of coast tribes will include the ocean in their term for "world".

825

96, 23. Túhush talpatkóla. Mud Hen, one of Aíshish's five wives, looked out from under the roof of Aíshish's lodge or shed to see what was going on. This fiction explains the round dark spot visible on the mud-hen's head; its *round* form is indicated by the prefix la- in laliga.

AÍSHISHAM SHASHAPKĔLÉASH.

NOTES.

*539 773 192 [372] [484] Portions of the same myth, though differently connected, will be found in the mythic tale: K'múkamtch attempts the destruction of his son Aíshish. Both narratives are complementary to each other in some important details.

99, 6. shnéna. It is the custom of gamblers to build fires at every place where they stop on their road or trail. Any party of travelling Indians will do so when stopping on their way. Cf. 23, 15.

99, 3. Yámnashptchi. Several adjectives designating colors are taken from articles of dress in both dialects: tolalúptchi, green; tchχé-utchχe-ushptchi, a shade of blue; and spálptchi, light-yellow, is called after a face-paint made of a kind of clay.

[825] 99, 3. Wanákalam lú'loks. The fire of Young Silver Fox was yellow or yellowish, not only because the fur of this fox-species turns from silvery white into yellowish by the change of seasons, but also, because this animal represents in mythic stories the halo around the sun. Cf. shakatchálish in Dictionary. Wanáka always figures as the companion of the principal national deity, K'múkamtch.

99, 7. wátchpka: to stake everything in one's possession and then lose it all; wí-uka, to win all the stakes lost by the others.

99, 10. 100, 5. Stókua or Stúknaga was, according to another of my informants, a fish of this name, and not a squirrel. The other wives of Aíshish all have names of birds.

100, 3. luélks: K'múkamtch had inherited a locality where his father was in the habit of hunting and killing the giant-eagle (p'laíwash). Thinking of this place, K'mukámtch went there with his son Aíshish, after scheming a stratagem to let him perish there. To kill the eagles, it was necessary to climb a pine-tree; this K'múkamtch was afraid of doing, and wanted to send up there his son instead.

100, 9. shnúlas toks etc. The lark had her young in the nest of an eagle.

100, 10. shlû'tantsa. He dressed himself in Aíshish's garments, as appears from the foregoing mythic tale.

100, 15. sas. Dave Hill often uses shash, sas in an almost reciprocal sense: while (or: for) going to gamble among themselves. This pronoun does not depend here on shnéna, as we might assume. Cf. *Note* to 58, 10. It refers to the playmates of Aíshish, who set out with K'múkamtch, whom they thought to be their beloved Aíshish on account of the dress he had abstracted from him. In 100, 14 shash was explained to me by "from them", viz. from the wives of Aíshish, in whose lodge K'múkamtch had passed the night.

100, 18. gê'pkat for gépka at: did not come now, or: has not come yet.

101, 2. gê'tak. This adverb gives to understand, that they were loth or too tired to play any longer for stakes, because their beloved Aíshish was not present. "To cease or stop gambling" simply, would be expressed by saklóla.

101, 4. shtí'a etc. Cf. *Notes* to 89, 5; 96, 6; and general *Note*, on page 86.

[193] 101, 4. shí'dsho wenépi, rather unusual forms for shí'dsha hû vunépni. Hû, "up, above, on head," has coalesced with shí'dsha into one word.

101, 5. Klití'sam. Aíshish heard the cries of Klétish only, because of all the birds which are believed to be his wives, the long-necked sandhill crane is the loudest and noisiest.

[825] 101, 8. gatpampēlíssa for gatpámpēli sha, as tchíssa for tchí sa.

*539 101, 8. p'tisá m'na for p'tisha m'nálam.

773 101, 10. kakó bělat for: kakó pil at.

192 101, 11. p'tissap sam. Sham, sam "their", is found standing instead of m'nálam,
193 p'nálam, or húukělamsham in the conversational form of language. Cf. 107, 13. 103, 4.

101, 13. liwátkal. They lifted up the famished Aishish, almost reduced to a skeleton, and seated him upright in the nest; they imparted new strength and life to him by feeding him.

101, 16. kédsha, to grow, forms kédshna, kedshnúta; n's is: nû'sh, to me, with me, under me; a sort of *dativus commodi.*

ORIGIN OF HUMAN RACES. DURATION OF HUMAN LIFE.

[115]

GIVEN BY "CAPTAIN JIM" IN THE KLAMATH LAKE DIALECT.

K'mû'kamtch hû'nk at né-ulχa ná-asht gén: Hû'nk E-ukshikíshash
K'múkamtch ruled as follows: The Klamath Lake

tchák máklaks shû'ta; tchúi pén Kä'kakilsh tchágsh máklaks shû'ta;
from a service-berry bush people he made; hereupon the Käkakilsh from skunks people made;

yámatalā génûta shûshtédshna. E-ukshkíshash ktchálχishtat í'lχa, Bósh-
northwards while he had gone he created (them) on his way. The Klamath Lakes in the sun-heat he laid down, the white

tinash toks shûtólank máhieshtat í'lχa; húmasht gíug nä'd máklaks mû'-
people however after creating (them) in the shade laid down; therefore we Indians (are)

makmûkli, Bóshtin toksh papálpali. É-ush guní'gshta käilalí'a.
dark, the white race but light-complexioned. The sea beyond he made a world for them.

At sha pä'n ne-ulakiéga, K'múkamtch mû'nk tchí'sh shkíshkí'sh tchísh
Then they began to legislate, K'múkamtch, mole also, fly-bug also,

wishí'nk tchísh. Mû'nk häméχe: "Nû a gû'ggamtchishash máklakshash
garter-snake also. Mole said: "I of old age the human beings

gí'tki gí!" Húnkanti wíshink ná-asht häméχe: "nû'toks gémptcha
to become want!" On that subject garter-snake thus spoke: "and I thus-made

máklakshash gí'tki gí!" Tchíhunk wí'shink shkíntchishχagóta: "gá-ash
the men to become older!" Thus garter-snake while shedding its skin: "this way

nû hû'nk máklakshash k'léktgi: tí'dshok nétnāk gít k'mû'tchatk gíntak
I the men to become (want): having grown then to be of old age though

tchíltgipěletám'nûk." Húnkanti mû'nk ná-asht heméχe: "nû a gémptcha
always to grow young again." On that subject mole thus said: "but I thus-made

pshe-utíwashash gí'tki gí: gû'ggamtchishash!" Pí muimû'yuk: "gá-asht
the human beings to become want: decrepit by age!" (And) it shivering (said): "thus

nû pse-utíwashash gí'tki gí!" Skí'shkish tchísh ná-asht tok nä'-ulχa
I the human beings to become want!" Fly-bug also thus voted

103, 3. tchák. There is evidently a *jeu de mots* intended between tchák and tchákash. Which northern tribe the Kákakilsh were, my informant and other Indians were unable to say; it is a nickname, derived from kā'k, of some Oregonian tribe held in contempt by the Máklaks, and any reference to it causes great merriment to the Klamath Lake Indians. Máklaks is in both places separated from the tribal name by inversion; tchák and tchágsh form apposition to these tribal names and to máklaks, and for tchágsh we would expect tcháshlsh, which is the usual form of the word.

103, 5. É-ush. The sea or ocean, which is meant here, is múni é-ush, while é-ush means a lake, lagoon or large pond.

103, 6. ne-ulakiéga. Three of the lower animals are here brought together to confer with K'múkamtch to determine the duration of man's life, and every one voted according to its own experience. Stephen Powers mentions a mythic story comparable to this, heard by him among the Pit River Indians (Contrib. to North Amer. Ethnology, vol. III, p. 273): "The coyote and the fox participated in the creation of men and animals, the first being an evil spirit, the other good. They quarreled as to *whether they should let men live always or not.* The coyote said: "if they want to die, let them die"; but the fox said: "if they want to come back, let them come back." But nobody ever came back, for the coyote prevailed."

103, 9. 10. After shkiutchishχagóta supply hemé χe, and after k'léktgi: gi.

[193] 103, 10. tí'dsok, or tít'shok, distributive form of t'shók, of the verb t'shin to grow. Cf. tít'sha, 107, 12.

103, 12. pshe-utíwash, abbreviated pshé-utuash, an archaic word used only in the *collective* sense of people, human beings. It occurs only in mythic stories. Cf. 105, 8.

104, 4. shtû'ya. This fiction was suggested by the manner in which moles throw up mole-hills and shows that the ancient myth-makers were not without a humoristic vein.

104, 4. pí'pil. Every mountain was thrown up by the mole alone, each one separately. The special creation of K'múkamtch was *man*, and whatsoever stands in direct connection with his existence, welfare and customs, as fishing-places, islands, funereal sweat-lodges etc.

104, 4. húnta, abbreviation of húntala: by proceeding in *this* manner, in the *same* manner.

HÛ′MASHT SHÁPASH LÛ′PI SHUTEYÉGATK.

CREATION OF THE MOONS.

down — she rolled forth and back — joking — about K′múkamtch. — (Then) burst her own — bowels.

NOTES.

*539 In preference to any other beast, the prairie-wolf, small wolf, or coyote (as he is
773 called in the West after an Aztec term meaning "digger, burrower") became con-
[825] nected in the mind of the Indian with the creation of the moon and the origin of the
months or moons, because in moonlit nights he is heard howling from nightfall to dawn; sometimes alone, sometimes in packs of several dozen at a time. His querulous, whining howl is likened by the Indians with a "speaking to the moon". Our tale above is based upon the double sense of *moon* and *month*, in which the term shápash (the "indicator," from shápa to tell, indicate) is used. The idea of the creation of twice twelve moons originated in the delusion that in every period called *new* moon, moons were really made or manufactured *new* by the creator. The number twenty-four was perhaps suggested by the observation of lunar eclipses, or mock moons appearing in hazy weather. The coyote as the creator of the moons (and the creator of the universe among the Central Californians) naturally desired to have as many moons as possible; while K'múkamtch, as the wolf's antagonist, thought it better for the benefit of his own
*539 creation, the human beings, not to make the year too long. If the winter had to last
773 twelve months instead of six, how could they collect roots, bulbs, seed, fish, and game
192 enough to live through such a length of time?

105, 2. shipátχúkanka. Two moons being on the sky simultaneously would necessarily often cover and thereby eclipse or hurt each other.

105, 2. iggá-idshnank. The mother-coyote had hung up the twenty-four moons made by herself around the walls and ceiling of her winter-lodge, which in this myth signifies the sky. The suffix -ídshna points to her walking from one spot of the lodge to another while busy in suspending the moons.

[776] 105, 3. gú'hli'. A great deal of shrewdness is ascribed to the principal deity of the Klamath Lake people as well as to those of other *hunting* tribes. He manifests his astuteness in entering the coyote's lodge in her *absence* only, and to prepare a trick for her there.

105, 4. tát' né for táta nen.

[194] 105, 5. Hitá tchia! is pronounced as if it was *one* word only: hitátchia.

105, 6. shû'shamka, distributive form of sh'û'mka, to hum, grunt, to make hă hă. He grunted every time he planted another awl, sometimes in an interrogative tone of voice, and did it to disguise their secret planting into the ground.

105, 7. wákaitch composed of wák haitch; wásha-wéka composed of wásham wéaga; tχéwag or tχéwaga, diminutive of tχé-u first, first in order, eldest; cf. hû'ktag.

[193] 105, 7. tû'm haktch. This language has a term corresponding to our *too much* (tû'm tchátchui), but none which renders our *too* with accuracy. Adjectives or adverbs qualified by *too* are therefore pronounced with a higher pitch of voice and the quantity of their main vowel is increased when the Indian intends to express this adverb.

105, 10. wakaí, "why not," a combination of wák and ḵá-i.

105, 14. gatpanû'la gi'ta: he has come here and has left again.

[825] 105, 16. Kiti'ta. The coyote-wolf, while rolling forth and back on the ground, as these animals are in the habit of doing, ran her belly into the bone-awls insidiously planted there by K'múkamtch, so that the entrails shed their contents on the lodge-floor.

Skélamtcham Tchashgayákalam Shashapkĕléash.

MYTH OF THE MARTEN AND THE WEASLET

Given in the Klamath Lake Dialect by Dave Hill.

K'mukámtch Yámsi tchía. Sátapealtk Tcháshgayaks; lápiak tchía
K'múkamtch in the North [illegible] lived. His younger brother (was) Weaslet; only two they lived
ḵäíliak wä'wans. Tsúi sa saíkän géna wéwansh í'ktcha; tû'mi saíkän tchía
without wives. And they to the prairie went wives to bring in; many on the field were
máḵlaks tánkt. Tchúi sgúyue Skä'lamts Tsásgayaks í'ktchatkí snáweds:
Indians then. And dispatched old Marten Little Weasel to fetch a woman:
"ḵá-i í labĕ-lû'lp-gipksh shpû'nshipk, shtchokápsh í ä'pka!" Tsúi géna
"not you a two-eyed one bring along, a one-eyed one you bring!" Then went he
nádshiak í'ktchuk wéwans, tsúi tû' mé-ipks gáldsui. Saígatat tû'mi
alone to fetch women, and far off digging (roots) he met (them). On the prairie many
wéwanuish méya; shtá saíka; híhashuaksh ḵä'gi, gáukanka sha. At
females were digging; full was the prairie (of them); the men were away, hunted they. Now
wéwanuish íḵáyula tí'tatsa pí'la, ḵá-i hû'shkank K'mukámtsam stû'leōls:
women he picked out pretty ones only, not minding of K'múkamtch the order:
shtchû'shtsχapksh K'mû'kamts épkatkí gí'ulatkí; at í'tpa tû ládsastat
one-eyed ones to K'múkamtch to bring enjoining; then brought (them) over to the lodge
Tsáskai: "gén m's ní spûnshipkía." At häméχe K'mukámts: "kaní ná-asht?
Weasel: "this one for you I brought." And said K'múkamtch: "who (said) so?
kaní ná-asht tidsá ä'pkatki? shtchû'shtskapksh mí'sh nû ä'pkolatkík; ḵaítoks
who so (said) pretty ones to bring? one-eyed (ones) you I to bring told; and not
mí'sh ní tí'dsa ä'pkatki gi!"
you I pretty ones to bring told!"

Tchúi at wä'wanslank shash, tsúi pálakak nχákgí lápuk; tchúi tít'sha
And took as wives them, and pretty soon became mothers both; and grew up
weweás, at mat sa waslalá. Tchúi sí'ssok hû'k weweás sham; tsúi stuli'
the children, and, it is said, they hunted chipmunks. And quarreled boys their; and advised
Tsasgáyak: "shlí't í hû'nks!" taltsiágatat sa-ûlí'a. At slä'popk hû'nitak
Weaslet: "shoot you him!" (and) on the little arrows he put stone heads. And was aware by himself,
K'mukámts stûli'sht pi'ts. K'mukámts stûli' wä'ka m'ná: "shlí'sht m'nálsh
K'múkamtch that had advised him. K'múkamtch ordered son his: "in case he shoots, him
í shlín!" At lä'-udsha hû'k tátaksni, tsúi shlí'n Tsasgayákalam vû'nakag;
you shoot!" Then went to play the children, and shot Little Weasel's little son;

*539 773 shlí'n K'mukámtsăm hû'nk únakag; tchúi sa híshlan. Tsaskayákalam
shot of K'múkamtch the little son; then they shot at each other. Little Weasel's

vúnak hûnk shlín lû'pi K'mukámtcham vunáka; tchúi hû'nk hû'tkalpalank
boy shot first at K'múkamtch's son; then (that one) jumping up again

shlín Tchashgáyam únaka, tchúi tsóka lápuk.
shot Weasel's son, then perished both.

At sálěki ptisaísap sham. Tsashgái at káyaktsa, K'mukámts ká-i
Then missed (them) fathers their. Weasel went searching. (but) K'múkamtch not

káyaktcha, skû'lχa tā'dsh sá-utamank; slä'bopk hû'nitak tû' sas hishō'kst.
searched (for them), laid himself on bed but, wrapped up; he knew by himself, out there them to have killed each other.

NOTES.

Compare with this myth the first part of the "Mythic Tale of Old Marten" (Skélamtcham shashapkěléash), which contains the same subject-matter.

[103] 107, 1. Yámsi, contraction of Yámashi. This is the name given at present to a mountain North of Klamath Marsh; from this direction the cold winds (yámash) blow over the highlands on Upper Klamath Lake.

*539 773 107, 1. 3. 9. Tchάshgai sometimes occurs in the diminutive form Tchashgáyak, because the Weasel is regarded as the *younger* brother of the Marten.

192 193 107, 2. saíkän, a contraction of saigaχě'ni: they went *to* the prairie, where the women were digging the edible roots.

107, 3. Skä'lamts. I have given this myth elsewhere in a longer relation, where the part played here by K'múkamtch is played by Skélamtch. Even in Dave Hill's relation the Marten is called, but once only, by its real name Skélamtch; K'múkamtch and Skélamtch are mentioned *here* as identical. The term skě'l, when not employed in its mythologic sense, means a long piece or strip of tanned otter or marten skin, used for tying the hair, or for other purposes.

107, 3. 4. I'ktchatki snáweds etc. One woman only is mentioned here, instead of the two, whom Weaslet was ordered to bring home as wives for his brother K'múkamtch and himself.

107, 5. wéwans a very common elision for wéwannish.

107, 9. kaní ná-asht? ellipse for kaní ná-asht gi?

107, 10. nû ä'pkolatkik. Instead of this may be said also, ä'pkatki gíula nû: "I strictly told (you) to bring in."

107, 13. sa waslalá. The two boys went together hunting chipmunks.

[411] 107, 14. shάwala to adjust stone-heads; shawalia, sa-ulía to adjust stone-heads for or in the interest of somebody. Flint-, obsidian- or iron heads are placed only on war-arrows or on arrows used in killing large game (ngé-ish, ngä'-ish); but the táldshi or lighter arrow, used in hunting birds, and the taldshiága, arrow used as boy's plaything, are usually provided with wooden points only.

107, 15. K'mukámts stûli sht pi'ts stands for K'mukámtchash stuli'sht pi'sh, the pronoun referring to the little son of K'mŭkamtch.

107, 15. shli'sht. In this sentence m'nálsh is the subject of shli'sht, and the direct object of shlín is not expressed.

107, 16. lä-udsha: they went out to play, from léwa, lä'wa to play.

SKÉLAMTCHAM SHASHAPKĔLÉASH.

*539
773

MYTHIC TALE OF OLD MARTEN.

OBTAINED IN THE KLAMATH LAKE DIALECT FROM MINNIE FROBEN.

Wéwanuish mat tû'mi méya k̲ä'sh shaígatat yákí shkä'shkatgaltk.
Women, they say, many were digging ipo on prairie, baskets carrying on back.

Shkä'lamtch mat tchía shetχé-unaltχ Tchashgáyaks. Shkä'lamtch shtûlí
Old Marten, so they say, lived as the older brother of Little Weasel. Old Marten sent

tâ'pia m'na Tchásgayaks í'ktchatki gíug kmä' shtchû'shtchχapkam. Tchúi
younger brother his Weasel to obtain the skull-caps of the one-eyed ones. And

Tcháshgayag géna; gátpnank í'tχa shash nánuk kmä' k̲á-i shtchû'shtch-
Weasel went; coming there, he took away from them all skull-caps, (but) not of the one-

χapksham tchi'sh, ítpampĕli Tchashgáyak, shéwana Skélamtchash kmä'.
eyed (women) also, brought Little Weasel (and) gave to Old Marten the caps.

Skélamtch häméχe: "táta mí'sh nû tpéwa k̲á-i shtchûshχápkam epkátki
Old Marten said: "when you I ordered not of the one-eyed to bring?

giug? lápûk mísh nû épkatki gí'ula shtchû'shtchχapkam pí'l." Wéwanuish
of both you I to bring had told of the one-eyed only." Females

nánuk gátpa Skélamtchamkshi shkashkátkaltk k̲ä'sh. Skélamtch shewaná-
all came to Old Marten's home carrying on back ipo. Old Marten re-

pĕle kmä' wéwan'shash, puäkámpĕle ladshéshtat, hä'mĕta Tchashgáyaksh:
turned the caps to the women, threw (them) back out of his lodge, (and) said to Weasel:

"táta mísh nû tpä'wa tûm kmä' ä'pkatkí gíug? lápok ámsh ni ä'pkatki!"
"when you I ordered many caps to bring? of both (only) you I to bring (told)!"

Wéwanuish tchík tchúi gémpĕle, lápuk shtchû'shtchχatk tchí'dsha.
The women after this returned, (but) both one-eyed ones remained.

Tchúi hûk shtchû'shtchχatk wéwanuish wewä'kala. Shû'hank=shitk
Then the one-eyed women bore children. At the same time when

mû'mkak gí'ulχa Skélamtch nteyakalíya, m'na ñ'nakag mû'ak t'shí'sht.
the infants were born Old Marten made a little bow, for his little son, taller when he would grow.

Tchashgáyak tchí'sh nteyakalí'ya m'nátak únakag. Tchúi tchatchákiag
Little Weasel also made a little bow for his own little boy. And the little boys

lé-utcha: bí'shla nté-ishtka tatáldshiak. Léwatkuk tátakshní gatpámpĕli;
went to play: they shot at the mark with their bows little arrows. From the play the boys returned;

Tcháshkayagalam únakag heméχe: "hût án'sh tû' shlí'kshga." Tchash-
Little Weasel's boy remarked: "he me out there well nigh shot." Little

gáyag wû'la m'na únakag: "tám hai tchí' m'sh hû'nk láyank téwi?"
Weasel asked his young son: "really thus at you taking aim he shot?"

*539
773

Tchákiak heméχe: "hûshûtánkapksh pû'sh nûsh hû'n gi" (mshásháltchatk
The boy said: "approaching on the sly me it was" (squirreling were
sha hû'nk, shléank msliásh hishlákshka). Tchúi Tchashgáyak shtuli'
they, discovering a squirrel they almost shot each other). Then Little Weasel advised
únakag m'na shlí'tki Shkélamtcham únakag, "hä hû't mish pän shlí'shtka
little son his to shoot of Old Marten the son, "if he at you again shooting
gí'uapk." Shkélamtch sháyuakta hûnk nánuk Tchashgáyakalam hémkanksh;
should be." Old Marten became aware (of the) whole of Little Weasel's discourse;
tchúi pi' tchísh shtuli' m'na û'nakag shlítki gíug Tchashgáyam
and he also ordered his little son to shoot Weasel's
únaka: "hä' mísh shlí-uapk, k̲lä'χatk gí'ntak i hû'tkalpalank shlí-uapk
son: "if you he kills, dead though, you rising up again must kill
hû'nksh."
him."

Tchúi mbû'shan pä'n géna wáshlaltchuk; shláa sha wáshla, gánta sha
Then next day again they went to hunt chipmunks; saw they a chipmunk, crept (at it) they
at. Skélam únakag téwi, ká'hhian wáshla; wiggáta i-úlχa Tchashgáyam
then. Marten's little son shot, missing the chipmunk; close to he struck the ground Weasel's
û'naka. Tchashgáyam únak häméχe: "wák ta i gíug shlí'kshga nûsh?"
to the son. Weasel's little son said: "wherefore you almost shot me?"
Skélam únak hémtchna: "shní'ulatchgankan hû'n gi." Guhásliktcha pēn
Marten's child replied: "glancing off it was." They started (and) again
géna sha, shláa sha wáshla. Lápuk pí'pēlantana gánta shawaltánkank
travelled they, saw they a chipmunk. Both from opposite sides crept up moving along the ground
tä'wi; Skélăm únak shlí'kshga Tchashgáyam únaka. Tchashgáyam vúnak
shot; Marten's little son almost hit Weasel's little son. Weasel's little son
shlínk shíuga Shkélam vúnaka; tchúi shpóka mántchak Tchashgáyam
(then) shooting killed Marten's child; then lay on ground for some time Weasel's
únakag. Tgí'tsχank shlépapka, k̲ék̲almâsh wewatkuéla lû'lp, k'máka tgû'tgank
little son. Standing near he looked (at him), tears flowed from (his) eyes, he looked around while standing
hátkok. Skélam û'nak hû'tkal, shlín at Tchashgáyam vúnaka
there. Marten's son jumped up, shot then Weasel's child
û'shûtal; lápuk tchúi k̲'léklχatk í'pka.
in the breast; both then dead lay there.

Tcháshgai hém'ta Skélash: "wák ta mā'nshaktch tátaksni k̲ä'gi waíta?
Weasel said to Marten: "Why for so long the children are absent the whole day?

people will frighten only."

Tchúi Skélamtch shnélχa Lĕmé-ish titaká-aksh.
Then Old Marten burst Thunders the Old.

NOTES.

This relation of the myths is more circumstantial than the corresponding one obtained from Dave Hill, which omits some of their characteristic features. We have here an interesting and probably the most popular part of the whole cycle of *marten-myths* known to the Klamath Lake people; the above is not a single myth, but a series of myths, some of them thrown together in a rather loose connection. What connects them all is the fact that Weaslet is the constant companion of his older and more sagacious brother Old Marten, who combines the qualities of Reineke Fox with that of an elementary power of irresistible force (shkaíni). The Skélamtch myths present themselves in the following order:

1. Selection of the one-eyed females as wives.
2. The children of the two brothers destroy each other.
3. The fathers cremate their children's bodies.
4. The Winds are exterminated by Skélamtch.
5. Skélamtch hides a woman before one of the five Thunders.
6. Skélamtch enters the lodge of the Thunders; the hat on his head acts as a spell and prevents them from entering it.
7. Old Gray Wolf, Marten, Weasel and the five Thunders are feasting on human flesh in the lodge of the Thunders.
8. Skélamtch sets the lodges of the five Thunders and of the two Old Thunders on fire and kills the inmates.

*539 773 192 482 193 109, 1. shkä'shgatkaltk. A verbal adjective of shkátkēla, to carry on back; kä, ka is the radical syllable, found also in kä'mat, *back*. This distributive form is apparently due to vocalic dissimilation. Women carry conical baskets (yáki) on their backs when digging roots or bulbs, and throw them over their shoulders into these receptacles.

222 109, 2. 6. 8. Skélamtch. See Dave Hill's relation of the same myth; *Note* to 107, 3. In speaking of somebody who acts on the sly, and differently from what he professes and means to do, the Klamath Lake people will say: "He acts like Skélamtch."
193 This is one of the few proverbial locutions, or at least figurative modes of speech that can be traced in this tribe.

291 109, 3. kmä' is the rounded light cap usually worn by females, fitting tight to the skull. It is made of the stalks of aquatic plants, several species of them entering into the manufacture of each cap. The taking away of the skull-caps was intended as a signal for the women to go to their new homes.

109, 6. táta. The words of reprehension addressed by Old Marten to Weasel are: "Did I ever order you to bring the caps of any other than of both the one-eyed women? I told you to get the caps of both one-eyed women only." Lápuk belongs to shtchûshχápkam, though separated from it by the inversion of the sentence; kmä' is left out.

193 109, 6. shtchûshχápkam. The distributive form of shtchû'χa is so difficult to articulate, that abbreviations of it like the above and others, have resulted. Shtchúχa is evidently the medial form of tchóχa, and its meaning is therefore "to suffer destruction on oneself." Cf. shtchúyampka.

109, 10. ni ä'pkatki. After ä'pkatki supply gi: "said, told."

109, 11. The text forgets to mention the calling in of the two one-eyed women.

109, 12. Shû'hank-shitk. In many mythic stories the newly-born children are made to grow miraculously fast, so that when a few days old they handle bow and arrows, and after a month or two they are adult people.

194 109, 13. ntéyäla, to make a bow or bows (nté-ish), nteyákäla, to make little bows (nteyága), nteyakalía or nteyakalíya, to make little bows *for somebody*.

109, 13. únak, *son*, is variously pronounced û'nak, vúnaka, wúnak; and so is its diminutive únakag, únakaga, vúnakak, *little son*, "*sonny*".

109, 15. híshla has two meanings, both *reciprocal:* to shoot at each other, and to shoot at the mark, *rivalling to outdo each other* in markmanship. Cf. 24, 17.

193 109, 15. Léwatkuk for léwatko hûk: they, after having played; participle of léwa to play.

110, 1. hûshûtánkapksh etc. "This was an approaching himself on the sly towards me" is the literal rendering of this sentence, in which the first term is a *nomen actionis*, a verbal indefinite. The two pronouns are governed by it.

110, 3. mish shli'shtka gi'uapk, if he should want to shoot you; if he should shoot at you purposely.

110, 4. Sháyuakta, "he knew." Omniscience and prescience are among the characteristic features of Old Marten, who is the personification of K'múkamtch. Cf. 107, 1. 3. 14. 108, 5. and *Note* to 107, 3.

110, 6. hútkalpēli, to rise up suddenly, to jump up again (though killed beforehand). Cf. 108, 2.

110, 11. "shui'nlatchgankan hû'n gi." Marten's son said, that his arrow, when

*539 dispatched after a chipmunk, struck a log or tree, glanced off from it and came very
773 near killing Weasel's little son.

192 110, 11, 21. guhášhktcha instead of guhuášhktcha, cf. Dictionary.

110, 17. vû'sho, breast, chest, is also pronounced wû'shu, û'shu; û'shutala, in the chest. k̲leklχátko is the distributive plural of k̲'lekátko; k̲'léka, to die.

[193] 110, 18. mā'nshaktch, so long; stands for mā'ntchak tchí. The terminal -ak has to be taken here and in 110, 14. in the sense of the diminutive suffix: "a little long".

110, 19. k̲ä'la to *do* or *act* in the sense of amusing oneself, playing, gesticulating, or acting in a loud, noisy, or grotesque manner.

111, 1. túnepanti. The partitive case in -ti, if it stands for túnepanta, is used here, because the bags of neckwear brought by Skélamtch were counted on the digits of one hand, while those of Weasel were counted on the fingers of the other.

111, 3. wewilína. Beads were left over to Old Marten, because he had brought more than five sacks full to the tchpínû or family burying ground, emptying only five sacks on the child's pyre. This was a fabulously extravagant expenditure, the beads standing high in price and the sacks or wíllishik being rated at more than one bushel each.

111, 4. Mû'sh and Yámsh, syncopated from Mû'ash and Yámash.

111, 9. eíχishtok Mû'shash. The South Wind had put his head out; that is, a south wind had been blowing when Little Weasel died and hence was supposed to be the real cause of his death.

[821] 111, 12. Lĕmé-ishash. From the following it appears, that the five Thunders re-
present more the flash of the lightning (lúepalsh) than the roll of the thunder. There
are many of them, because the thunder, when rolling over mountains and valleys, often
increases again in loudness after having almost died out, and five is the often-recur-
ring "sacred" number of the Oregonian and other Northwestern Indians. The radix
[193] of lĕmé-ish is *lam*, which indicates a circular, whirling motion. The five Thunders are
[342] brothers, living in a winter-lodge or earth-house: Lĕmé-isham tchī'sh, thought to be
a dark cave; their parents, the two Old Thunders, live in a káyata or low, small hut
covered with bulrush mats. The short episode 111, 12–17 does not refer to all the
five Thunders, but only to one of their number.

[321] 111, 13. tû'tash is the long white marine shell, known as dentalium; it is one of
[301] the most common Indian body-ornaments. The white resin flowing out of pine-trees
seems to be symbolized in this myth by the dentalium-shell.

111, 14. wák ish shû'tă, for wák shúta i nish: "somehow do (something) for me."

[193] 111, 20. In wā'shin are combined two locative particles: *í* and *a* (for na).

111, 22. mák̲laks tû'm (for tû'ma). The Thunders brought home as food many human beings struck by lightning.

112, 1. wanúnga, the distributive plural of û'nak; explained in the Dictionary.

112, 1. wenníni a tuá gátpa etc. Here and throughout this paragraph tuá means "some kind of."

112, 2. 3. shkaíni combines the meaning of strong with that of bad or mischievous, and answers to our *demoniac;* shkaíniak or shkaínihak stands for our comparative: stronger. The -tch, -s, -sh appended is an abbreviation of tcha, *now*, and shkáyent stands for shkaini at.

[342] 112, 3. Gékansha. Old Marten had entered the solid "earth-house" of the Thun-

*539 ders, while the Thunders stopped in the small kayáta which was the abode of their
773 parents. To enter such an earth-lodge a high ladder called ga-ulúlkish must be climbed
192 on the outside, and another ladder, as long or longer than the other (wakísh) leads into
342 the interior. Pätchö'le nä'shak, pépätchle (for pépätchöle) lápok wakísh: "he had
417 stepped once", "twice" down on the inside ladder; that is, he had made one step, two steps on it commencing from the top. Each one of the Thunders, when trying to penetrate into their own lodge, gets a little further down than the previous one, but all are driven out by the *chilling*, powerful spell of Skélamtch's headdress.

112, 7. gúlipälánk. The second of the Thunders, frightened at the ill-success of his experiment, retired again to the low hut or kayáta, where the other Thunders were and where their parents dwelt. This word has two accents on account of shash being enclitic; cf. 111, 2. 112, 13. 113, 9.

112, 8. Tátχēlamni refers in this connection to the relative age of the brothers: "the third in age of the five Thunders."

112, 9. gekanshĕnû'nk: for gékanshna hû'nk. Cf. 113, 12. ktánshan nánui sχolχótak, for: ktánshna nánui shχolχóta ak.

112, 9. gû'tχitkt, a contraction of gû tkitko at.

193 112, 11. 12. "Ya! ati' a nä'lsh winnī'χitk tuä'ki." This was said by all the five Thunders simultaneously and *unisono*. In tuä' ki, á is altered into ä', almost ó. The inserted particle hû, û "in the distance, out there, over there" seems to have produced this change.

112, 15. Ī'lhankshti ī'tpa "he brought some venison," a phrase corresponding exactly to the French: "il apporta *du gibier*"; both nouns standing in the partitive case. These partitives are governed by another noun in 113, 6 (máklaksti) and 113, 7.

112, 21. pûelhí': they threw the dead Indians down into the lodge from its roof. The suffix -l- indicates a downward direction, like -ila, -knéla etc., and occurs also in 112, 17, hä'mēle, to speak in a downward direction, to shout to somebody standing below. The suffix -hi means down to the ground, or on the ground, earth, soil, and since the lodge-floor is the soil itself, it also means "into, or in the lodge or wigwam".

113, 2. íwa sha tchúi. They put into the bucket the bodies of the dead Indians to stew or boil them up.

113, 2. Nókshtak etc. The gray wolf, the marten and the weasel all being carnivores, there is nothing extraordinary in the fact that mythic fiction lets them participate in a meal consisting of human flesh.

113, 3. háshpa shash. Shash stands for máklaksash, the dead Indians.

113, 8. nánuk wû'ta. Marten ate up all the human flesh which he had taken out of the kála.

113, 8. shéwanank. The verb shéwana refers to a plurality of objects, the objects being sometimes expressed by a collective noun, as here (tchulē'ksh).

113, 9. Ké-udshiámtchkash stands for Ké-udshiamtch tchkash; nû'kla is to roast on coals; tchulē'ks is here venison meat.

113, 13. ka-uloktantktám'na. The verbal suffix -tám'na, which marks an action often repeated, or continued for a long time, is not here, as usually, appended to the simple form of the verb, but to its derivative in -tka.

113, 14. Tchékag. The blackbird has yellow eyes shining bright in the darkness,

*539
773
192

and on that account the myth makes it watchful at night. This is another bird-species than the *Merula*, known in Great Britain as blackbird.

114, 3. huhashtápkuak. They suspected each other of the trick, by which they had been tied together by the hair when in danger of being consumed by the raging flames, and in revenge stabbed each other. Huhashtápkuak is vocalic dissimilation for huhashtápka ak; cf. shiwákuash, 80, 11.

114, 8. k̲á'hhian. Weaslet missed the heart in the fire when striking at it.

114, 10. sháyuakah: "You will not be able, or not be powerful enough, to do mischief." The last heart that flew up is a meteor going through the skies, while the four other hearts indicate successive thunder-claps. When a meteor is seen flying west, the tribes of the Columbia River will say: "That's a deceased big man's heart going to the Great Sea." Cf. *Note* to 41, 7.

NOTES.

*539
773
192 The myth of the Bear and the Antelope is one of the most attractive and best stylicized of this collection. It forms a whole mythic story by itself, and not a series of myths like the preceding article. The Grizzly Bear's figure is drawn in very natural and characteristic outlines, and the same may be said of the other animals of the story. Some archaic words seem to prove that the myth has been handed down for many centuries to the present generation, which repeats it to the offspring with the *same* expressions as used by the parents. The archaic terms alluded to are Sháshapamtch, paépsha, pshe-utíwash, kúkui, tchitchû; probably also lepleputéa.

118, 1. 7. Sháshapamtch alternates in this tale with Lû'kamtch, the "Grizzly Bear of the Ancients," and so does lû'kaga with shasliápka. -ámtch, -ámtchiksh is the usual attribute "old" appended to mythologic characters. In the mythologic stories of the Indians bear-cubs always appear *two* in number, the older and the younger one. The same may be said of the majority of the other quadrupeds; cf. the two young of Old Antelope, in this story, and tχéwag, 105, 9, as well as of many of the personified powers of nature. Cf. the term lepleputéa.

[193 118, 7. 119, 2. gi'nk or kínka: a little, not much; mé-ishí contains the particle í or hí: "on the ground".

119, 9. pû'kpuka: she cracked hard ipo-roots, feigning to crack lice which she pretended to have found on the antelope's body. Picking lice from each others' heads (gútash kahíkla) and eating them is a disgusting practice which travellers have observed among all Indians of North and South America.

119, 10. nánuk: the whole of her body.

119, 11. ipĕnĕ'χi: to place something into a basket or receptacle which is already filled to the brim.

119, 20. 21. hû t málam etc. The construction is as follows: "málam p'gi'shap hû't máklĕχuk shû'dsha, p'gi'sha laggayápkash hû'nk killi't, hûnkiámsham shû'dshash": your mother made a fire out there because she must have passed the night there, and because she hung up this anus on a stick, while the Indians (who gave meat to both of us) had a camp-fire.

*539 **120**, 2. tchishkuapsht instead of tchishkuápkasht.

773 192 **120**, 10. vutátchkia is also pronounced utátchkia, hutátchkia. Earth-lodges which open on the top can be closed by means of a large cover placed over the smoke-hole.

120, 11. lepleputéa or properly: leplep-putéa, "to play the smoke out game with two on each side," is a compound of lápēni *two* in the shorter form láp, and púta to be [194] smothering. Láp has changed its vowel into a shorter vowel, *e*, on account of removal [193] of accent, and is here redoubled by iterative, not by distributive reduplication. Cf. lepχléks from láp and k̲'léka. A series of points after lepleputéa indicates that the animals repeated this word an indefinite number of times, while the others were inside the lodge, and while pronouncing putā', they opened again to let them out.

120, 17. tchúχasht tchē'k kaishnū'la. Literally rendered, this means: having perished finally, they uncovered. The subject of tchúχasht, lū'lχagsh, has to be supplied from what precedes. The smoke of the burning rotten wood killed the cubs.

[342] [417] **120**, 19. ga-ulū'lkish, from ga-ulóla to go out, is the outside ladder of the Indian "mud-house" or winter-lodge, averaging in length from 10 to 15 feet; the inside ladder, wákish, is somewhat longer to reach the excavated floor.

120, 21. The complete wording of this sentence, in which sháptki stands for shápatki, would be: k̲á-i sháptki giug Lúk̲ash, gátpampēlisht hū'nksh (hū'nkiash).

[193] **120**, 22. ágguipksh, contraction of aggayápkash: aggáyn to be hung up, or to be stuck into; said of long-shaped articles only.

121, 3. anulípka to take away something from another's lodge or house without asking for it; the suffix -ipka expressing the idea of "towards oneself." Anulípkuish, "what was once abstracted from others" appears here in the contracted form anuli'pkūtch; gé-u "by me, through me."

121, 9. tátatataksni shows repetition of the two first syllables of tatáksni children, but at the same time means "where are the children?"

121, 15. shálgidsha; the antelopes placed the coals there to secure their flight from the Bear; had the coals been put there by somebody else, lákidsha would be used.

121, 22. **122**, 7. hū'ktakag: familiar diminutive name given to the Grizzly Bear; hū'ktag, 121, 23., stands for one of the young antelopes.

122, 1. 2. Mbúshant tchē'k etc. The sense of this exclamatory sentence is as follows: "To-morrow at last I will play a sharp game with ye children, when in the day-time I can use my eyes to advantage." Lúlpatka is: lúlpatko a; "possessing eyes" is the primary signification of lúlpatko, but here it means "enabled to make use of the eyes". Cf. múkasham nū lúlpatko: I see as sharp as a horned owl. The distributive form pahépsha, of pahé, "during day-time" means "any time when the sun shines bright." Cf. pahéksh, noon-time.

122, 9. This blowing of personified objects of nature into sticks etc., is a fiction of which we have another instance in 111, 16.

122, 11. ndshenshkáni. See *Note* to 71, 6. 7.

122, 12. 13. tchiwá, tchī'tchu: tchi is a syllable found in many words referring to water and liquids, as tchíya to give water; tchiéga to overflow. This radical is no doubt an obsolete Klamath word for water and recalls the term tchū'k "water" in Chinook jargon: tltsuk in Lower Chinook, tl'tchuku in Clatsop; tchaúk in Nútka. It also occurs under various forms in the Sahaptin dialects. By this lake undoubtedly Upper Klamath Lake is meant. Cf. tchíwa in Dictionary.

*539
773
192
[193]

122, 15. ga tuá nink for ká-a tuá ni gíank; ká-a means here "vehemently, cruelly, sharply", tuá: "in some way or other".

122, 16. shash génuish: after they had left the cave.

122, 20. "aishing tā'dsh i shásh nen". Here nen stands for some finite verb; either shaná-uli i: you want to conceal them; or for má-asht i shapíya: "you speak so, in order to conceal them".

122, 23. spû'kua. The spread-out legs of the Crane had to serve as a bridge to the Grizzly Bear, for there was no dug-out canoe at their disposal to cross the river.

122, 23. máksha néklank. Old Crane carried on his leg a vase or skull-cap that belonged to a dug-out canoe, but did not possess a canoe himself.

123, 3. u'hlítcha. Grizzly shook out the remainder of the water to let the skull-cap become dry. Skull-caps are used throughout as drinking vases.

123, 6. táldshitko. This sentence has to be construed: wíwalag, shō'kshâm wewákalam táldshitko, ngé-ishan, and táldshitko stands for táldshi gítko: "the young antelopes, armed with the arrows of the Crane's children, shot" etc.

K'MUKÁMTCHIKSHÂM SHASHAPK̲ĔLÉASH.

THE MYTH OF K'MÚKAMTCH, THE FIVE LYNXES AND THE ANTELOPE.

OBTAINED FROM J. C. D. RIDDLE IN THE MODOC DIALECT.

K'múkamtchíktch hûnk géntko käflatat, käflash shutólan, túnep shléa
K'múkamtch walking earth upon, the world having created, five he saw

shlóa ánkotat wawakayápkash. Kaflio skútatko K'mukómtchigsh shpakága
lynxes on trees sitting. In a rabbit-blanket clad K'múkamtch tore to pieces

p'ná kaflio-skútash, heméχen: "tidshí' ûn gé-u skû'tash gítak shlû'a lue-
his rabbit-skin robe, (and) said: "a good to me robe will be the lynxes when

lóka." Ktái pe-uyégan shlóa k̲ai'hhō'ta; nāsh shlóa hûtχídshnan húdshna.
I kill." Stones picking up the lynxes he missed; one lynx jumping down ran away.

Heméχen: "ē, k̲á-i tídshi skútash gi-uápka!" Pēn k̲ai'hhō'ta ktayátka,
He said: "oh! not a good mantle it will become!" Again he missed with a stone,

pē'n nāsh shlóa hûtχídshnan hû'dshna. K'mukómtchigsh heméχen: "pē'n
another lynx jumping down ran off. K'múkamtch said: "again

nāsh hûtχídsha; at gé-u ketchgáne skútash gi-uápka." Ndáni shlóa wawag-
one skipped away; now my small mantle will become." The three lynxes sitting on

gáyan K'mukámtchāsh shushaluákta; pén ktayátka shlóa k̲af'hha. Nā'sh
(trees) at K'múkamtch scoffed; again with a stone the lynxes he missed. Another

pēn hûtχídshna húdshna. K'mukómtchiksh häméχe: "k̲émat pí'la nish
one jumped down (and) ran away. K'múkamtch said: "the back only to me

000 ûn wáldshtak." Pēn ktái luyégan shlóa k̲aí'hha, lápuk hûhatχídshnan
it will cover." (Another) stone picking up the lynxes he missed, both skipping down
hûhátchna. K'mukómtchiksh shuaktchtámpka:
ran away. K'múkamtch crying-commenced:

"ló-i lóyan lóyak, ló-i lóyan lóyak,"

pēn kaílio ndandkalkánkan hahashtatchmáyan ánkûtka kaílio p'na, pēn
again (of his) blanket gathering the pieces he pinned together with splinters blanket his, then
skû'tan kûháshgdsha.
putting it around himself started off.

Wigá hak génan tché-u k̲imádshăm pátko kládshat gshí'kla. Kaílio
Not far having walked, an antelope tooth-aching on a clearing lay. Mantle
p'ná tché-u wáldshan tchéwash hûnk ídû'pka tchékĕli tílktgi. Mbúshaksh
his over the antelope spreading, the antelope he kicked to make it bloodshot. For a stone-knife
k̲ayaktámpka nashgíû'tna; tché-u tapitánna hû'dshna; lĕ'ltki hûnk tchúi
he began to search to skin (it) with; the antelope behind (him) ran off; looking at it forthwith
hemé̆χen: "gé-u tchí'sh hûmtchí kí." Tché-u K'mû'kamtchăsh huyá-
he said: "mine also like this is." The antelope of K'múkamtch ran in
edsha. K'mukómtchiksh kaílio tchéwat shlekláрkash shléa, hemé̆χe: "tgélχ,
front. K'múkamtch (his) blanket on the antelope lying perceived, (and) said: "stop,
tgélχ! Pshe-utíwash mísh ûn shushaluaktántak, k̲ó-idsha mísh kaíliu
stop! The people you will deride, the miserable you rabbit
ámptchiksh gé-u skútash skutápkash."
old my garment wrapped in."

NOTES.

125, 1. käílash is one of the few instances where inanimate nouns assume the ending -sh in the objective case. This is, however, no instance of personification. Cf. páplishash 94, 5. Concerning the signification of käíla, cf. *Note* to 96, 23.

125, 2. kaílio, kaíliu, rabbit skins sewed together to form a garment, mantle or blanket. As the name indicates, it was originally made from the fur of the kaí-rabbit. Skútash may be rendered here by different terms, since many Indians used their skin robes, in which they slept at night, as garments or cloaks during the day.

125, 3. luelóka. The plurality of the lynxes is indicated by the verb lúela, which can be used only when *many* are killed; its singular form is shiúga. A similar remark applies to pe-uyégan and to wawaggáya. Lynxes are usually spoken of in the West as *wild cats*.

126, 3. ló-i lóyan lóyak is probably an interjectional and satiric variation of the verb lualuíχa: "they make fun of me", the distributive form of luaíχa.

126, 6. Wigá hak: *only* a little way. Subject of génan is K'múkamtchiksh.

126, 11, 12. Pshe-utíwash etc. This sentence shows the following structure: The human beings will laugh at you, dressed (as you are) in my miserable, good-for-nothing rabbit-fur robe. ámtchiksh here means worn out, old, good for nothing. This word is phonetically transposed from ámtch gish: "old being", "long existing". As such it appears also in K'múkamtchiksh, a Modoc form for K'múkamtch.

coyotes men-alike to look at are, from behind the hip the head up to.

NOTES.

I. In mythology the bat is sometimes regarded as a symbol of watchfulness at night, and this is expressed here by the adverb únăk.

127, 2. 3. 4. shlé-i-ek for: shléa i gi, "you cause to see;" shlé-etki for shléatki in a passive signification: "to be seen, in order to be seen"; shlé-ek for shléa gi: "make it to be seen, let it see."

127, 2. sk̲álapa, a Modoc term for a hat of some kind. The verb lútχa, used in connection with it, indicates its rounded shape.

127, 4. k̲á-i tche nû mish nen. Tche is abbreviated from tchĕk, particle pointing to the future, or to the termination of an action or state; the verb gi *to do* or shléa to see or to be seen is omitted: "I will not at all show (it), as you say."

127, 6. yankápshtia, to place into the entrance in order to impede or prevent egress. The radical in this term is tkáp, stalk, straw, little stick; yána, "down, down into", serves as a prefix.

II. This story of the skunk is manifestly a mere fragment of a longer one, for the omission of motives renders it as silly as can be. I have inserted it here to show the various verbs formed from níwa, "to drive into the water, or upon a level ground". This is a verb applying to *many* objects only; speaking of *one* object, shnúwa is in use. For all the derivatives of both verbs, see Dictionary.

127, 12. pitakmaní stands for pi tak m'na hī'.

III. This hog story is evidently the result of the consolidation of aboriginal superstitions with the evangelist's relation of the Gergesene swine throwing themselves into the Lake of Galilee from the headlands of Gadara. In Chapter XVII of his "*Wanema*",

000 Meacham has given several of these concretionary products of the uncultivated Modoc mind. In making a study of aboriginal mythology and folklore such fictions must be disregarded, though they may be of interest to psychologists.

IV. Races in an undeveloped, primitive state of mind are prone to regard living animals as the abodes of spirits, and most frequently the wild and carnivorous quadrupeds are believed to harbor wicked spirits. These are either elementary spirits, or the ghosts of deceased persons. To see a spirit means death, and in their terrified state they often behold, as here, the spirit in a half human, half beastly appearance, when coyote-wolves, gray wolves, bears, cougars etc. come in sight. Such a sight can cause the instant death of the hunter, or deprive him of his reason, or make him sick for months. In Greek and Roman mythology, Pan, the Satyrs and the Fauns retain something of these primitive notions (in the panic terror etc.), though these genii were largely idealized in the later periods of national development. In every nation a relatively large amount of superstitions refers to hunting and the chase of wild beasts.

128, 9. Tanktchi'kni is in fact an adjective, not an adverb; literally, it means "those who existed, or hunted since that time", and is composed of tánk, a while or time ago, tchēk, finally, and the suffix -ni. Cf. 13, 2. 128, 1.

SKŪ'KS-KIÄ'M.

HUMAN SOULS METEMPSYCHOSED INTO FISH.

he may kill	me.

NOTES.

[128] My efforts towards obtaining exhaustive texts from the natives concerning their belief in the transmigration of human souls were not crowned with entire success. Of the two items obtained, No. II is intended as a commentary of No. I, both treating [262] of the presence of human souls in fish. The cause why so many Indian tribes shun the flesh of certain fish lies in the fact that these species were seen feeding upon the bodies of drowned men and swimming around them. This induced the belief that man's soul will pass into the organisms of these finny inhabitants of the wave, even ×539 775 787 192 when death has resulted from other causes than from drowning. According to Hill, the Mák̲laks believe that the souls or spirits of the deceased pass into the bodies of living fish; they become inseparably connected with the fish's body and therefore cannot be perceived by Indians under usual circumstances. But in *one* status only they become visible to them; when Indians are bewitched by the irresistible, magic spell of a conjurer or of a wicked genius. Then they enter into a ta[illegible]nuash-dream, and when they see a dead person's spirit in such a dream, they are almost certain to [755] die from it. Only the intervention of the conjurer and of his song-medicine can save them from perishing; rigorous fasting and ascetic performances cannot be then dispensed with, and with all that no certitude of his final rescue is to be had.

[769] Here as elsewhere the pronouns hûk, húnkiash etc., are inserted instead of the unpronounceable name of the deceased, and mean: *dead person, spirit.*

129, 2. píl mák̲laks; only dead Indians, not dead white men, because during their life-time these did not believe in the skû'ks; this belief is a privilege of the Indians.

129, 2. Hushtí'χak etc. This sentence runs as follows: Tchĕ'ktoks hushtí'χa ak nish, hûk tchĕ'k nish síuksh shanahō'li, wakiánhua tchēk p'násh (or pû'sh) nû'sh shuíshaltki gíug shanahō'li: "if he (the bad genius) makes me only dream in that manner, then he intends either to kill me, or perhaps he wants me to keep the song-medicine [756] for myself." To keep the song-medicine, shuíshlá, is to undergo fasts and ascetic performances under the supervision of some conjurer for an almost unlimited time, five years at least.

129, 3. 4. Hä'toks ni' shläát etc.: if I should see (the dead) while I am *awake.*

[193] 129, 4. Skû'ks-kiäm, a compound word, may be rendered by spirit-fish, letiferous fish.

130, 1. Kiä'm k̲'leká etc. The rather obscure sense of this statement may be made comprehensible by the following: "When fish are dead, they are dead forever; hence

*539
775
787
the souls of all dead Indians continue to exist in the living fish, in all kinds of *living* fish only."

[192]
130, 2. tsóχatk. This refers to Indians who have perished by a violent death, as well as to those who died in the natural way.

NOTES.

823 I. This myth intends to explain the existence of the large number of rocks found at the locality called Shúyuχalkshi.

196 193 131, 2. K̲á-ak̲amtch. The adjectives -amtch, -ámtchiksh appended to animal names designate mythologic characters. Adjectives of an equal meaning occur in all the western languages, as far as these have been studied. Cf. *Note* to 126, 11. 12.

825 II. In this myth, as well as in other grizzly bear stories recorded in this volume, this bear is always killed, conquered or cheated by his quicker and more cunning adversaries. Nevertheless his clumsy form and narrow, ferocious intellect are very popular among the tribes, who have invented and still invent numerous stories to illustrate his habits and disposition.

103 131, 5. K̲íuti is the name of an Indian camping-place situated a short distance north of Modoc Point, on eastern shore of Upper Klamath Lake.

193 131, 6. hátkok qualifies shkû'lχa and yámnash is the indirect object of shûlû'tamantk. Shkû'lχa, nánuk yámnash shûlû'tamantko, wawakshnátko tchish: "he lay down to sleep, keeping all his neckwear on himself, and not taking off his moccasins." Shûlû'tamna can in other connections refer to the clothing, but here it has special reference to the beads.

131, 11. kti'ukuela. Tradition reports, that Old Grizzly was pushed over some of the high rocks at Modoc Point.

173 131, 13. Yámakishash etc. In these words may be recorded the reminiscence of an ancient fight between the Klamath people and some Northern tribe which had come South on a hunting expedition. A Klamath song-line given in this volume also recalls
*539 an ancient inroad made by the "Northerners". The grizzly bear represented the
773 Klamath tribe, the wolf the Northern Oregonians, perhaps as ancient totem signs; the
825 bear having been killed by an intruder, the Klamaths had to take revenge for the insult.

823 III. The object of this myth is to explain, among other things, the origin of the white spots on the head and back of the loon (táplal). But the myth as given in the

*539
773
825
823

text is far from being complete. It refers to a locality above the confluence of Sprague and Williamson Rivers, called Ktaítini, or "Standing Rock". A high rock stands there at the edge of a steep hill, and, according to the legend, the Indians who put pitch on their head were changed into that rock. Near by, a lumber-dam looking like a beaver-dam, across the Williamson River, partly resting on rocks projecting from the bottom of the river. K'múkamtch longed for the destruction of this dam, muddied the water to prevent the Indians from fishing and hired the loon to destroy the objectionable structure. The loon dived into the waters and forced its way through the dam by main strength. The Indians dwelling on the shore depended for their living on the fisheries, and seeing their existence at stake tried to gig the loon, but succeeded only in hitting its tail-feathers. When the loon had accomplished his task K'múkamtch offered to reward him in any manner wished for. The loon then wished to have white spots on its back, and K'múkamtch satisfied the request by spitting chalk upon the downy surface of its body.

fore not they kill (them).

NOTES.

*539 171 I. What is contained in these short items refers equally to the Klamath Lake and to the Modoc people, although those contained under I. were obtained from various informants belonging to the former chieftaincy.

[192] 133, 2. páka to howl, bark; pák'la to howl repeatedly, to howl for a while; pákluipka to howl for a while in the distance towards somebody.

[177] [231] 133, 4. 5. The cat and the chicken being but recently introduced among these tribes, this superstition must have been transferred to them from other animals. By inversion, the words tchíkin gû′lu, *the hen*, appear here widely separated from each other.

[192] 133, 6. K̲ú-i tchămlûk has to be resolved into: k̲ú-i tchē mál (for málash) hú′k: "bad then for you this is!" Cruel fights will follow.

133, 7–11. This story is not clearly worded, but we are taught by it how these Indians are conversing among each other with laconic breviloquence. An Indian living in the vicinity has heard the whining of the dog which means death to his owner. He goes there, shoots the man and takes to his heels. A relative of the murdered man comes up and is mistaken by others for the murderer. They deprive him of his wife, his property and his liberty; he becomes a madman on account of the injustice done to him.

[825] 134, 1. 2. The raven (k̲ák̲) is supposed to be a bird of fatal augury, because he was seen devouring the flesh of dead Indians. Compare: General *Note* on page 130.

[202] 134, 4. kíukayunk. They adjust a rag or piece of skin to a pole and stick out that improvised *flag* on the top of the lodge to notify neighbors that they had a dream last night and desire an interpreter for it.

[525] [825] 134, 5. One of the legs of a dead black tmélhak-squirrel is cut off and laid under the gaming-disk or the pá′hla to insure luck to the player.

134, 7–12. Tcháshăsh etc. This is a fragmentary extract of a scurrilous skunk-myth, which I have not been able to obtain in full from my informant, the Modoc chief Johnson, who speaks the Klamath dialect. This myth is well known through the whole of Oregon, for parts of it are embodied in a popular and melodious song of the Mólale tribe, whose ancient home is the country east and southeast of Oregon City and Portland.

134, 7. 8. mák̲laks nánuk is the direct object of hushtsóga; the skunk killed them by his stench.

[601] 134, 9. tû′paks stands for tû′pakshash; túpakship, abbreviated túpaksh, is properly the younger sister, as called by or with reference to an elder brother, while pa-ánip

*539 171 is the elder sister, called so by or with reference to a younger brother. Two other terms exist for the relative age of sisters among themselves.

[601] **134, 11.** pátkalp'le. The myth adds, that the eagle got up again at dinner-time and that after washing the face he took a nap before taking his sister home.

[525] [777] **II.** These items were all obtained in the Modoc dialect from J. C. D. Riddle. Many of the articles mentioned as gamblers' amulets are supposed to bring good luck to the gambler on account of their *scarcity*, which must have made them more interesting to the aboriginal mind than other objects of a brighter exterior.

[192] **134, 13.** ntággal, ndákal: to find accidentally; shléa: to find, generally, after a search. vumi' is to hide away either on one's own person or in the ground.

134, 16. 18. tídsh tínχa is to succeed, to be lucky; without tídsh in: hútoks tínχantko gi, that man is lucky.

[411] **134, 17.** shtáp is a black arrow-head made of obsidian, a volcanic rock found in several places in these highlands.

135, 1. hä'-atoks is formed from hä toks with intercalation of the declarative particle a.

[192] [193] [825] **135, 3.** k'le-ugtki-uápkasht is a periphrastic conjugational form composed of gi-uápkasht, of the verb gi, and of k̲'lé-utka, the usitative of k̲'léwi, to cease, stop, terminate; -utka has turned into -ugt- by metathesis. Literally: "would habitually cease to be in the Pit River." mhû', the grouse, is called by the Klamath Lakes tmû'.

---

woman;	to her	fish	you may give;	plenty	to me	she will continue to give	having received presents.

Kámp'kuk	k̲éliak	pásh	tiä'ma.	Undsē't	kátchkal	pa-uápk	gé-utala steínash.
The indigent	without	food	is hungry.	By and by	tobacco	I will chew	to my heart's content.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539
171

Sanáhole	kátchkal	titchéwank;	ū'nds	pēn	mbúsant	pá-uapk	kátchgal
I like	tobacco	well enough;	by and by	again	to-morrow	I will chew	tobacco

pátkēlank.	Kaní	shlé-uapka	ū'ns	stoyuápka;	tóla	pákuapka	ū'ntch;	pēn
while getting up.	Outdoor (anybody)	should I see,	then	I'll cut off (some for him);	with (me)	he will smoke (it)	then;	again

wutuápka	kinkáni	kátchgal;	kinkáni,	k̲á-i	túmi,	tchē'k	pēn	túmi	pákuapka,
I shall spend	a little	tobacco;	(but) little,	not	much,	afterwards	again	much	I will smoke,

pakólank	sχólakuapka.
(and) after smoking	go to bed.

NOTES.

Of the two paragraphs of "Reflections" submitted, the first refers to the loss of some hunter's arrows, which had been loaned to somebody together with the bow. The second speaks in a rather egotistical sense of the pleasure which is afforded by succoring helpless and indigent people.

*539
171
136, 3. k̲ä'gi. This refers to some arrows, which cannot be found at the spot, to which they seemed to fly.

192
[193]
136, 4. 5. Untchēk, abbreviated undsē, ū'ntch, únds, ûns, points to some undetermined epoch in the *future:* by and by, after a lapse of time, some time from now; undsē't, 136, 8., through apocope and synizesis, stands for untsē'k at; undsē'ks for untchēk tchish.

136, 5. Shikútchipk tchiká kĕmutsátk, grammatically incomplete forms standing for skikutchípka t'shíka kĕmutsátko. The word *stick* is not expressed in the text, but the suffix -ipka, united to shikútcha, expresses the idea of "walking while leaning oneself upon something or somebody". Cf. láyipka, to point the gun at the one speaking; tilō'dshipka, to see somebody coming towards oneself.

136, 6. kĭ'shtchipka, to step towards the one speaking; cf. *Note* to 136, 5.

136, 7. onĭ'sh for húnish, cf. ō'skank for hû'shkanka, 65, 1. Húnish is the objective case of hû'n; but this pronoun is not regularly used when speaking of animate beings; hû'nkiash would be grammatically correct.

136, 7. shéwant ! The words onĭ'sh kiăm shéwant ! are supposed to be directed to one belonging to the speaker's household.

136, 8. The term kátchkal, tobacco, expresses the idea of an *intermixture* of several kinds of weeds or leaves for the purpose of smoking them.

136, 8. pa-uápk. A more appropriate term than this for masticating tobacco is: kátchkal kpû'yumna.

137, 1. titchéwank. This is in fact the participle of a verb: "I like tobacco, being fond of it."

137, 2. stoyuápka: I shall cut off a piece from a stick of pressed tobacco and give it to him. Cf. stuyákishka, to clip the hair.

137, 3. kinkáni kátchgal. If this and the following were not worded in the conversational slang, it would read: kinkánish kátchgal; kinkánish, k̲á-i túma, tchē'k pēn túma (or tû'm) etc.

[274]
137, 3. k̲á-i túmi. Indians are not often seen to smoke continuously as we do; those inhabiting the Klamath Reserve take a few whiffs from their small, often home-made pipe, then pass it to the neighbor and emit the smoke through the nose. Sometimes they swallow the smoke for the purpose of intoxication, and the elder women smoke just like the men. Cigars offered to them are cut small and serve to fill up their tobacco-pipe.

*539
763

WAILINGS AT THE APPROACH OF THE FATAL HOUR.

[115]

GIVEN BY DOCTOR JOHN, OR K̲ÁK̲ASH, IN THE KLAMATH LAKE DIALECT.

"Ngä'-ish a ni tä'lχapksh, gé-u tä'lak, shlín antsa; shkék antsa nû'sh,
"An arrow me striking, my arrow, shot they; they broke (my) head,
shlín nish. Kán ish shlín? Tsuyä'sh ni shlín, gén ish tsuyä'sh mpáta,
they shot me. Who me shot? Through the cap I was struck, this me cap kills,
3 másha n'sh, shlín ish nû'sh, k̲á-a n's mā'sh', guhuá nish, a nish k̲á-a mā'sha!
it pains me, they shot me in the head, intensely me it pains, am swollen I, now me hard it pains!
Pásh ish shéwan i; k̲'lékuapkan pánuk; pálak shéwan i, a nish k̲á-a mā'sha,
Food me give you; I will die after eating; quickly give you, me very hard it pains,
tiä'matk k̲á-a, pálak shä'wan i." At shéwana nû, at pán; shnuk' át mí'dsû.
(I am) hungry very, quickly give you." And give (him) I, and he eats; he takes now the spoon.
6 "At k̲'léka, átĕni k̲'léka; tsía at, k̲'leká taks nû; shlín nish nû'shtat.
"Now I expire, now I die; I live yet, dying but (am) I; they shot me in the head.
[764] A ni k̲'léka, ä'tĕni k̲'lekála." At k̲'leká. Shû'dsha lúluksla sa lû'lokshtat
Now I die, now I am sinking fast." Then he dies. Kindle a fire (and) cremate they in the fire
hû'nk k̲'lékapksh.
the deceased man.

NOTES.

*539
763
192

This short incident of war is full of the most dramatic interest, and gives some idea of the oratorial powers of the average Indian. It was obtained from a man who undoubtedly had witnessed more than one similar scene during the numerous raiding expeditions made by his tribe before the conclusion of the treaty in 1864.

138, 1. ngä'-ish a ni tä'lχapksh shlín antsa, forms of the conversational language standing for ngä'-ish a nish tälχápkash shlín a sha. gé-u tä'lak "my arrow," a poetic symbolism for the arrow that causes my death.

138, 1. shkék antsa for shkéka a sha, but nasalized like shlín antsa. Shkéka properly means to pierce, but is used in a medial sense.

138, 2. mpáta properly means to dry up by heat. The cap or hat is said here to kill the man by exciting an intolerable fever heat within him.

[193]

138, 3. mā'sha n'sh. Some impersonal verbs can also assume the personal form of intransitive verbs: mā'sha nû and mā'sha nish: "it pains me"; kédshika nû and nish: "I feel tired". The Modoc dialect prefers the personal form.

138, 6. 7. atĕni for at a ni. Cf. sŏ, **82**, 4. tchä'lχet **90**, 11. átĕnish, atĕni **90**, 12. 13. gĕ'ntĕni, *Note* to **93**, 7. 9.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

THE LORD'S PRAYER.

I.

*539
782
177

Nálam p'tíshap, kat p'laí tchía: Nánuk nä'd hû'nk mí shéshash kátak
Our father, which on high lives: All of us thy name truly
shtí'nta. Mí húshkanksh gû'ta nä'lsh. Í hû'nk vû'nhuapk génta käílatat,
worship. Thy mind come to us. Thou wilt achieve on this earth,
wákaktak p'laítalknì gi. Shéwan í nálsh gē'n waítash nálam pála-ash
equally as (thou) on high dost. Give thou us this day our bread
nánuk waítashtat. Hä nálsh tuá kó-idshi gíntanuapk, ká-i hûn, p'laítalkni,
every on day. If on us anything wicked should stick on, not it, thou on high,
hû'shkank í! húmashtak nä'd ká-i hû'shkankuapk, hä kaní nálsh kú-i
mind thou! just as we not would mind it, if somebody us wrong
gí'uapk. Ká-i nálsh í tuá shutétki kú-idsha, í ínúhuashkpak hak nálsh
should do. Not to us thou anything let do wicked, (but) thou keep away only from us
tuá kú-idsha. Húmasht giúg mí né-ulaks, nkí'llitk tchí'sh, ktchálshkash
anything wicked. For thine (is) the rule, force also, glory
tchísh tchúshniak. Húmashtak an hûn gítk gi!
also forever. Thus I it to be say!

II.

Nálam t'shí'shap, p'laí tchía: Mí shéshash nánuk stínta; mí kóχpash
Our father, on high (who) livest: Thy name all revere; thy mind
gáltchui nanukä'nash nä'l. Gitá tchí'sh käíla humashták gi, wákaktoksh
come to every one (of) us. Here too on earth in the same manner be done, just as
p'laí ki. Nálash gēn waítash shápěle shéwan í. Ká-i nálash kó-i shû'tä,
on high is done. To us this day bread give thou. Not us wicked render thou,
húmasht nálam máklaks-shítko stínta. I huáshgi nálamtant kó-idsha
equally as our men-kindred (we) love. Thou keep off from our bad
steínashtat kóχpash; tídsh nálam steínash shútä. Mí tála litchlítchli, mí
(from) heart thoughts; good our heart make thou. Thine alone (is the) power, thy
steínash litchlítchli tchússak, mû'ni lákiam steínash. Húmasht toks tídsh.
heart strong (is) perpetually, great of the Lord the heart. Thus (it will be) well.

NOTES.

These versions of the Lord's Prayer are good instances of what can be attained, without using too many circumlocutions, in rendering religious, moral and other abstract ideas in a language deficient in many of them.

[192] For reign and kingdom no words exist, and they had to be rendered by hû'shkanksh, or in Modoc kóχpash, "mind", né-ulaks, "rule, law"; sin and forgive were

*539
782
177
192
[193]

rendered by "something wicked" and "not to mind"; for "thy will be done" stands "achieve thou". Power and glory become "force, impetuosity" and "radiance", and daily bread: "flour on every day". In the Modoc version, the wording of which is inferior to that of version I, the use of similar expedients will be observed.

I. In the Klamath Lake dialect; by Minnie Froben.

139, 6. inúhuashkpak, phonetic inversion for inuhuashkápk' ī; see Dictionary.

139, 7. ktchálshkash, from the word ktchálχa, to shine, to be radiant, resplendent.

139, 8. gitk, in an hûn gitk gi, is the verbal intentional gitki.

II. In the Modoc dialect; by the Riddle family.

139, 10. Gitá käíla is equivalent to gĕ'nta käílatat; in humashták gi the verb gi has to be taken in the *passive* sense.

139, 11. k̲ó-i shû'tä: "do not render us wicked." For shútä compare 111, 15. and *Note.*

139, 12. húmasht nálam. Between these words and the preceding ones there is a lacune in the text. mák̲laks-shitko, "our kindred": those who look like ourselves.

139, 13. 14. In mī tála litchlítchli the adjective strong stands for "strength, power", while in mī steínash litchlítchli it is used in its adjective signification. In this language abstract ideas are sometimes rendered by adjectives and by verbal adjectives in -tko.

DIALOGUES.

I.

*539

Tsématk. Tatá lish sha ksíulakuapk?
When they will dance?

Skä'lag. Pá-ak k̲á-i an sháyuakta! uná a sha ná-asht she-édshtat mat
Not I know! once they so (said), on Saturday
sha nánuk shûkû'lki-uapk kshī'ulχish.
they all will assemble for the dance.

Kápuak. Tátai tchī'k sha kshíulakuapk? Plē'nkamkshi â? tám hak
Where after all they are going to dance? At Frank's house? perhaps
haítch ī hû'nk shläátk? k̲úi a sha nen hûnk máshish gísh shápa.
(did) you him see? seriously they him diseased to be say.

Skä'lag. Káyak an hátokt gátpantk, ná-asht tä'dsh toks nû tû'mēna gén
Not I there was going, thus however I heard this
mbû'shant pil, mat pá-ula: gät tóks nû wátch káyaktgûk, kúinag
morning only, (that) he was eating: out there I of my horses while returning from the search, away from any house
gépgapēle.
I returned.

Kápuak. Tám haítch ī nä'gsh shíwaksh shläá gúni, gémpktch Kúyamtsχēksh, Ellen Débidam mû'kag shétaltchapksh mā'shisht?
(Did) you absent from home the girl see over there, who went to Ká am Skáwikshi, of Allen David a baby to visit having fallen sick?

Skä'lag. K̲á-i an tû'sh shleá pûsh.
Not I anywhere saw her.

Kápuak. Ī.
Is that so?

*539

Skä'lag guhuáshktcha; Käptinámkshi tchkash sha vûlánkía: "Tát i tamnû'tka?"
Skälak left; at the Captain's lodge also they inquired (of him): "where you come from?"

Skä'lag. Gē't an wátch káyaktka, ksíulakshχēn genû'tuapkuk.
Through there I of (my) horses returned from the search, towards the dance-house while intending to go.

Captain. Táta haí tchí'k sha kshí'ulaktchuapk?
Where finally they are going to dance?

Skä'lag. Mbû'shant a sha she-édshtat kshíulaktchuapk Mbû'shak-Shiwáshkni, ák tchísh nánuk gépkuapk.
To-morrow they on Saturday will dance the dwellers at Mbû-shak-Shiwash, probably too all will come.

Tchúi guhuáshktcha gémbaluk.
Then he started off to go home.

II.

Hlékosh. Tát lísh mi û'nak?
Where (is) your son?

Pépakli. Le-utchólan kaní úna geknō'la; le-utchólan tunepä'nish tatákiash túla.
For playing outdoors a while ago he went out; for playing five children with.

Hlékosh. Wakaítch gé-uga k̲aí gépgaple?
Why not returns he?

Pépakli. Tútaks atí léwa; hótaks tatáksni waíta léwapka; lítki gatpampěli-uápka.
Away far they play; those children the whole day will play; in the evening they will return home.

NOTES.

*539
192
[193]

I. Dialogue about a dance to be held on the Williamson River; in the Klamath Lake dialect, by Minnie Froben.

140, 2. Pá-ak k̲á-i an sháynakta! is interpreted by "what do I know!"

140, 9. nä'gsh shíwaksh gémpktch stands for négsh shiwákash genápkash. It is very rare that diminutive nouns, like shíwak, shíwaga, assume the ending -ash in the objective case; cf. 23, 10. But shíwak means not only a little girl; it means an adult girl also, and is therefore inflected like snáwedsh.

140, 9. Kúyamtsχēksh. For this local name cf. Page 91, first *Note*. Frank and Allen David live both at that place, close to the steep western bank of the Williamson River, while the communal dance-house, a spacious, solid earth-lodge, lies further to the northeast.

141, 5. Mbû'shak-Shiwáshkni, term corrupted from Mbû'shaks-Shawálshkni: "the one who lives, or those who live at the locality of the obsidian arrowheads." Mbû'shaks-Sháwalsh lies on the eastern shore of the Williamson River. Cf. *Note* to 134, 17.

II. Dialogue in the Modoc dialect; by Toby Riddle.

141, 9. Léwa, to play, forms the derivates lé-utcha to go to play; lé-utchna to play while going, to play on the way, cf. shuédshna 99, 2.; le-utchóla to go to play in the distance.

*539
192
193

141, 11. gé-uga for the more common giuga, giug.

141, 12. léwapka to play in the distance, out of sight, or unseen by us; but here this term is more probably a synizesis of léwuapka, the future tense of léwa.

NAMES BESTOWED ON UPPER KLAMATH LAKE LOCALITIES.

GIVEN BY DAVE HILL IN THE KLAMATH LAKE DIALECT.

K'mukámtch mat käfla shû'ta. Tsúyunks ä'-alk käfla shutólan:
K'múkamtch, so they say, the country made. The following names gave he, the country after creating:

Tulí'sh käila E-ukskí'shash shúta K'mukámts kiäm-luelkalí'a; Tulí'sh tsí-
"Tulish" place for the Lake people made K'múkamtch to be their fish-killing place; Tulish,

hunk ä'lχa. "At hû'nk käfla git ktaíksi Shúyakēksh tchín ä'lχa; gitl
thus he named it. "And that spot there where the rocks are, "Jumping-Rocks" so I name; here

shuyéakēks gi-uápka". E-ukskísas K'mukámts né-ulχank heméχe:
a leaping place shall be". To the Lake people K'múkamtch ordering said:

"Tû'kua ná-asni kä'la nä'sni élχa gí'ta Tû'kua; Gû'mbat nä'sni git élχa;
"Túkua so I a spot, so I name here Túkua; Kúmbat so I there give name;

gíta Kä'lalksi nä'sni élχa gí'ta. Wakáksi spû'klishtat gí't i spû'kle-uapk;
there Dirt-hauling place, so I give name there. At Wáka in the sweat-house there you shall sweat;

hä' me wéash k'lä'kuapk gí't i spû'kle-uapk, hä' mi snáwedsh kĕlákuapk
if your child should die, there you shall sweat, if your wife should die,

git i spû'kle-uapk túnepni gitá; túnepni spû'kle-uapk snawédsh, hä' mi
there you shall sweat five (days) there; five (days) shall sweat (you) wife, if your

hishuáktch kĕlä'kuapk. Túnepni spû'kle-uapk, tsúi kíllitk tsulä'ks gí-
husband should die. Five (days) you shall sweat, then strong (your) body will

uapk, ká-i pálak i kĕmútchuapk."
become, not fast you will become old."

"Nāsht ni ne-û'lχa Á-usmi shéshuapk; nä'sni élχa gēn käfla.
"Thus I ordain Á-ushmi to be called; thus I give name to this spot.

Keháshti ná-ast ni élka gí'ta. Ê-ukalkshi nä'sni élχa gí'ta; gí'tats spû'kle-
"Set out" thus I call that place. E-ukalkshi so I name this place; here also you shall

uapk, tuní'pni i spukle-uápka wéas k'lekáluk, tû'nipni snawédshĕsh kĕle-
sweat, five (days) you shall sweat a child after losing, five (days) a wife after

káluk hishuáksh tchish; ká-itoks mi sa-ámoks kĕlékst ká-i i spû'kle-uapk,
losing, a husband also; but not, your relatives having died not (then) you shall sweat,

hä' mi sa-ámoks nánuktua tsókuapk. Ká-i i gitá spû'kle-uapk ndännántak:
if your kinsmen of all degrees shall have died. Not you there will sweat but for three:

snawédshtat, hishuákshtat, wéashtat."
for wife, for husband, for child."

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539
773
103

"Nakótk Wí'tlas k̲ok̲état hí tchí'sh luélks-kiäm gí'-uapk; na-ást shé-
"By (its) dam Wítlash in Williamson River there also a fish-killing place shall be; thus

shash élχa ni: Ktá-i-Tupáksi. Mbû'saks nä'st shéshatk mák̲laks gí'-uapk;
name give I: Rocks-where-stand. "Obsidian" so called a people shall exist;

Smä'k nä'st sésatk gí'-uapk mák̲laks gí'ta. Kä'katils nä'st sésatk gí-uapk
"Hairy" so named shall exist a people there. "Armpit-hairy" so called shall exist

gí'ta mák̲laks."
there a people."

NOTES.

All Mák̲laks admit that K'múkamtch created their country, the earth and the universe, but as to the special process by which he created them they seem to have no definite idea, though they possess a multitude of myths for special creations.

Most of the places mentioned in this item are situated around Upper Klamath Lake. That they are localities inhabited for centuries past, and identified with the history of the tribe is proved by the fact that their naming is ascribed to K'múkamtch. The most noticeable of them are no doubt the three sweat-houses, all of which are of remote antiquity, and were put to use only when families were mourning the loss of one of their members. Two of them are quoted here: Wakáksi or Käilalkshíni spúklish on west side of Lake and Ē-ukalksi, a short distance south of Fort Klamath. The third lies about three miles south of Modoc Point; it is called Ká-ashkshi spúklish.

*539
773
103
192

142, 1. käíla. About the meaning of this term in creation myths, cf. *Note* 96, 23. In other connections, in the present text, käíla or kä'la means spot, locality.

142, 2. 3. Tulish. To enable the Indians to catch fish at that place, K'múkamtch built for them, as tradition has it, an obstruction resembling a beaver-dam. Cf. nakótk, 143, 1.; gití for gíta hí.

142, 3. 5. Túkus and Koháshti are camping- and fishing-places on the eastern shore of the Lake. At Shuyakē'kish the Indians leap over rocks for amusement.

142, 5. ná-asni, ná'sni stands for ná-asht ni: "thus I".

142, 5. 11. Gúmbat is called Rocky Point by the white population, and lies on the western shore of Upper Klamath Lake. A-uami is an island of the Lake.

142, 6. Wakáksi or Wáka is named after the tuákish-fowl whose cry is wáka wáka.

[765]
[177]

142, 6–10. 12–16. These mourning customs are gradually disappearing at the present time. One reason for this is the progressive assimilation of the tribes to American customs, another is the circumstance, that all of the three ancient sweat-houses are situated outside of the reservation limits.

142, 15. ndánnántak is composed of ndánnanti or ndánnantat ak: "only for three (kinds of relatives)".

[193]

143, 1. Nákotk is the instrumental case of nákōsh, lumber-dam: "on account of its dam Witlas will be a fish-killing locality." A loon destroyed that dam by forcing its way under it; one of our texts gives this myth. Cf. 132, 1–3 and *Note* to 74, 2.

[829]

143, 2. 3. Mbû'saks, Smä'k and Kä'katils are names given in contempt or derision of the respective tribes; the latter to Indians living at the Dalles of Columbia River, Smä'k to a tribe living south of that locality. Cf. 103, 2. 3. Mbû'saks is a name for the Snake Indians.

[115]

MISCELLANEOUS NOTES ON ANIMALS.

GIVEN BY JOHNSON, CHIEF AT YÁNEKS, IN THE KLAMATH LAKE DIALECT.

Nī'l	wéksa	pû'l'hka	mák̲laks	shû'lhashluk	sχō'lhok;	ktánuapkuk
The down	of mallard-duck	pull out	the Indians	to make pillows	to lie on;	for sleeping

sχō'lhank	nī'l	ikúgank	willishī'kat.
(and) resting	the down	they are putting into	pillow-cases.

Mbû'shant	nílaksht	wísχak	hä'ma.
In the morning	at dawn	the wisχak-bird	sings.

Wátsak	wáwa	a gulíndshisham;	le	génug	wáwa.
Dogs	howl	because left behind;	for not	going (with them)	they howl.

Yá-ukal	tchaggáya	ánkutat	ä'-unank;	untsä'g	ā-unólank	húndshan-
Bald eagle	sits	on tree	replete with food;	after a while	after depleting himself	he will

uapk,	tó-ugshtant	húndsanuapk	Ä'-ushtat.
fly off,	to the opposite shore	he will fly	of Upper Klamath Lake.

Tché-u	gankánkatchuapk;	tī'tnāk	mák̲lakuapk,	wakiánua	lápēni;
Antelopes	(people) are going to hunt;	once only	they will camp out,	or perhaps	twice;

shlíuk	gépgapluapka	pálak.	Ûndsh	mbúshant	pä'-uapk	sχólăkok.
after shooting (antelopes)	they will return	at once.	Some time	next day	they will take a cold bath	to induce sleep.

K̲ó-i	shû'ta	wásh,	pálla	n'sh	wásh;	k̲ó-idshi	wásh.	Múatch	kpē'l
Wickedly	acts	prairie-wolf,	steals	from me	prairie-wolf;	mischievous (is)	prairie-wolf.	A long	tail

gī'tko,	tidsá	nē'l	gítko	wásh.	Kinkáni	wásh	É-ushtat.
(he) has,	delicate	fur	has	prairie-wolf.	Scarce (are)	prairie-wolves	at Upper Klamath Lake.

Kaí-udshish	nísh	k̲ópk̲a;	k̲ílōs	k̲é-udsis;	shlá-a	nísh	tslatskágantko
Gray wolf	me	bites;	impetuous	is gray wolf;	(when) sees	me,	jumps on my throat

k̲é-udshish.
gray wolf.

NOTES.

[192] 144, 1. nī'l wéksa stands for nī'l wéksam; pû'l'hka for púlχa or púlk̲a: -lh-, "by hand."

144, 9. 10. These characteristics of the prairie- or coyote-wolf, which is so highly reverenced by the California tribes, place him between the wolf and the fox. Nē'l stands for nī'l and múatch for múnish. Tidsá is tídsha a.

[192
193] 144, 11. tslatskágantko; the verbal adjective of tchlakága stands here in the distributive form: "each time when he sees me, he jumps on my throat." The *l* of the second syllable is suppressed.

CLASSES OF ANIMALS AND PLANTS.

GIVEN IN THE KLAMATH LAKE DIALECT BY DAVE HILL.

Quadrupeds: hohánkankatk lílhanks; nánuktua hohánkankatk; wunípa tsŏ'ks gí'tk käílatat tchía nánuktua lílhanks wíkts nákanti.

Birds: lásaltk nánuktua.

Forest birds of small size: tchíkass.

Forest birds of smallest size: tchílililks, tchílililka.

Ducks and geese: mä'mäkli.

Night birds: psín húntchna.

Water birds: nánuktua huhánkankatk é-ushtat, ámbutat tchía.

Swimming animals: nánuktua udúdamkanksh sáyuaks; nánuktua udódamkankatk.

Fish: kiä'm.

Jumping amphibians, toads and frogs: skáskatkankatk.

Snakes: wíshink; wámĕnigsh.

Lizards; lit. "*walking straight out*": uli-ulátchkankatk.

Reptiles and worms: skískankankatk.

Flying insects: mánk.

Creeping insects, snails, some mollusks etc.: mû'lk, mû'lkaga.

Grass, seed-grass: kshún.

Berries: íwam.

Edible roots, bulbs and seeds: mák̲laksam pásh; lutísh.

Trees: ánku; kō'sh.

NOTES.

These generic terms are quite characteristic, but by no means systematic. These Indians classify animals otherwise than we do, for they regard the mode of locomotion as a criterion for their subdivisions of the animal kingdom, thus sometimes placing in the same class animals which widely differ in their bodily structure. The Indian mind likes to specify and is averse to generalizations; there are a few Indian languages only that contain comprehensive generic terms for "animal," "carnivore,"

*539
824
825

“reptile,” “amphibian” or “plant.” Even the English language had to borrow these terms from Latin. The Klamath Lakes often use kō'sh (pine) generically for “tree,” and wishink, “garter snake” for “snake,” the Modocs wáměnigsh (black snake) for the same order of reptiles, these species being the most frequent of their kind in their respective countries. Birds are hohánkankatk as well as quadrupeds, because they fly “in a straight line”.

539
262
824
[115]

ALIMENTARY SUBSTANCES.

LIST OBTAINED IN THE KLAMATH LAKE DIALECT FROM “SERGEANT” MORGAN AND MINNIE FROBEN.

Yántch kálkali, tχópo-pátpan, pakí'sh; kak tán: 18″; käíla̱tat lû'sha,
cylindric, thumb so large as, eatable; so long: 18″; on ground it lies,
ktaíyatat lushá. Shláps pushpúshli, lā'pi shlápsh.
on rocks it lies. The flowers (are) dark. two flowers (to it).

Kápiunksām k̲édsha saígatat; lû'k pûpashpúsh-tkani, lúiχitk tchí'pshash.
grows in the pra'rie; the seeds (are) blackish, larger than tchípsah.
Wéwanuish hûnk shtä'ila wékank yákitka páta-gíulshēmi. Pékshank sha hû'nk gápiunks shúta; tchiláls sha títatna. Wû'kashshitk máshetk kápiunks.
The women gather (it) by beating (it) into seed-baskets at summer's end. By grinding they kápiunks prepare; boil (it) they sometimes. Wókash-like tastes kápiunks.

[222]
[251]
[252]

Káshma k̲édsa walídsat, käílatat ushá; pálpal shlápsh, tsmō'k pí'luitk.
grows on rock cliffs, on the ground lies; white (is) flower, after fish smelling.

Kělátch k̲édsha wí-ukayant kěládshamat; kěládsh ntchekáni mămätchmä'tchli lálkaya. Wéwanuish kěládshla wâkslólank; shpahá sha tchúi ishkû'lank, í'lχa sha shpáhank í'lkshlûk lúldam, tchilálank tchēk sha pán.
grows on the low keládsh-bushes; keládsh-berry small blue grow on bushes. The females collect (it) after wókash-season; dry (it) they then after gathering, keep they (it) by drying to preserve (it) for winter, boiling (it) then they eat (it).

Kěnáwat k̲édsha saígatat, tsélas ka tánni 1′, pakí'sh; p'lái shláps pushpúshli, tídsh piluítko.
grows on prairie, stalk so long 1′, eatable; on top the flower is dark, good smelling.

Kláno pálpalish shlápshaltk p'laí, k̲édsha k̲ók̲etat, pákish, tíds másitk; má-k̲laks pán.
a white flower having on top, grows in rivers, is eatable, well tasting; the Indians eat (it).

*539 262 *Klápa* kálkali, pakí'sh; ka tánni 3"; taktákli pû'dshak, tápaχ kitchkáni.
is cylindric, eatable; so long: three inches: red (is) the pûdshak-grass, (its) leaves small.

824 *Klä'* kálkali lutí'sh; k̲edshá Móatok; pakísh.
is a rounded root; grows in Modoc country; (it is) eatable.

Ktä'ks wókash-shítko, k̲édsha táletat; ktû'ksam shlápsh pû'pash, pálpali, pakí'sh.
nuphar-alike, grows on straight stalk; of the ktäks the bud (is) (its) top, is white, is eatable.

Kä'ktä û'sha kä̆ílatat, pakí'sh; gémtchi tsélas: O.
lies on the ground, eatable; so shaped (its) stalk:

K̲ä'ls kálkali, pakí'sh; mû'na lû'sha ámbutat; kitchkáni shlápsh wítch-payam.
globular, eatable; deep down it lies in the water; small is (the) flower of the witchpal.

K̲ä's wé-uχalks tsélash gí'tk, shlápsh gítk; pakí'sh.
a forked stem having, flower having; palatable.

222 252 *K̲ōl.* Táktaklì tchélash gû'lam nû'kuk. Í-ukak mák̲laks hû'mtcha gû'l shtä'-ila túm, gítatoks k̲á-i tuá k̲ōl. Ámtatka sha méya pû'kgu-ishamtat shiû'lagiank, tchúi sha pû'ka; í'kagank pä'n shtápka ktáyatka. K̲ó-i pí'luitk, tídshi tadsh pä'sh; hä kaní k̲ō'l ē'nt, lû'k hû'nksh shtí'kok vû'shat.
Red (is) the stalk of the kol when ripe. Around Fort Klamath the Indians this kind of kol gather in quantity, but here (at agency) not there is any kol. With a stick they dig (it) to their roasting-place bringing it, then they roast (it); taking it out again they pound (it) with stones. Badly flavored, good however a food; if anybody kol carries on him, a grizzly bear him smelling will flee.

222 251 252 *L'bá.* Lupí' sha'hlmalχō'tchtat shápashtat l'bá nók̲a; wéwanuish stä'-ila yákitka wékank tíatka. Tsúi sha ítpampalank shpáha, shutéshluk sha gáma; skátka gáma gä'mkishtat. Wíllishikat sha íkû'ga pä'sht, tchúi sa vûmí vumí'shtat wíllishikat íkúgank.
As the first autumn-commencement in (that) month l'bá ripens; the females gather (it) in baskets, beating (it) with a paddle. And they bringing it home dry (it) for cooking they pound (it); with a pestle (they) pound in a mortar. Into sacks they fill (it) in after drying, and they bury (it) in caches, in sacks after putting it.

Léhiash k̲edshá Móatok; gí'tatoks É-ukshi k̲á-i léyash k̲édshant. Tánapsh-shítko shlē'sh léyash; wí-uka lē'ntk léyash; tchélash toks lé-isham nä'sh pétch atí taktákli shlápsh gí'tk. Móatokni shnítchí'χa lépuinatk páläsh shû'tank léhiash. K̲ú-i mä'shetk.
grows in Modoc land; but right here (at agency) in Lake country not léyash is growing. Turnip-alike to look at (is) léyash; not very deep lies léyash; stalk of léyash (is) one foot tall, red flower having. The Modocs fry (it) in frying pans into bread making léyash. Badly tasting (it is).

*539 262 824 [222]

grows on the pan-tree. The Indians pick it on pan-tree sticking to smear themselves with. roast (it) they on fire-place. Then they after baking (it), with knives scraping (it), smear it on faces, themselves from sun-burns to preserve; grease they putting into mix up.

NOTES.

[193]
[196]

Several plants in this list appear, according to grammatic rule, in the possessive case -am, while their fruits or edible portion are introduced in the subjective case. To the former the substantive ánku or tsélash has to be supplied. Small grasses are alimentary plants on account of their seeds only, while the larger aquatic grasses contain nutritive matter in their stalks. Of these notices the shortest and most laconic were obtained from Morgan, who did not enter into particulars concerning the preparation of aliments. By this list the articles on which these Indians feed are by no means exhausted; they eat almost everything found in nature which is not positively obnoxious to health and which contains a particle of nutritive matter, and hence a full list of their kitchen *répertoire* would be at least three times as long as the one obtained.

*539
262
824
192

146, 1. kak tán for ká ak tánni "so long only"; the length being shown by gesture of hand. Also expressed by ka taniáni, 149, 1. and *Note.* The yántch-plant grows to a length of 18 to 20 inches, the height of the camass- or pû'ks-plant.

146, 3. Kápiunksām. The kápiunks-seed grows on a prairie-*grass*, like the tchípash- and nû'tak-seed.

[193]

146, 7. 14. pálpal stands for pálpali (originally pálpal-li), having lost its terminal -i by apocope; pálpalish shlapsháltko incorporates the adjective *white* into the verbal adjective "having flowers". This phrase may be circumscribed by pálpalish shlápsh gitko. Cf. 123, 6. and *Note*, and 150, 1.

146, 8. wí-ukayant kĕládshamat. Here the adjective in its locative case, used attributively, is united with the partitive case of the substantive, the original form of both being wi-ukáyantat kĕládshamti; the subjective case: wi-ukáni kĕládsham.

146, 12. Kĕnáwat or horse sorrel is mentioned in an Aíshish-myth and does not

*539 262 824 grow so tall in the cold Klamath highlands as in the Californian and Oregonian valleys adjoining them to the southwest and west, where its height attains sometimes three feet. Cf. *Note* to 94, 9.

192 [193] 146, 14. **Klána**, an aquatic or tule-grass, of which they eat a portion of the young stalk. The term "tule," from Aztec *tolin*, serves in the West to designate all kinds of rushes, stalks, and grass-like plants growing in the water and wet grounds. By **k̲ók̲ĕtat** are meant the Williamson and the Sprague Rivers.

147, 1. **Klápa** is the name of the eatable bulb or root growing on the **púdshak**-plant. The **púdshak**-grass becomes red in the autumn, when dry.

147, 3. **Ktū'ks** is the eatable root of a species of the cat-tail plant; **táletat**, locative case of **tálish** (or **tálesh?**), straight stem, from **táltali** "forming a straight, unbroken line." The **ktū'ks** grows in the water, like the wild parsnip (**skáwanks**); the natives dry the tender roots of the **ktū'ks** and bake them into a sort of bread. The epithet: "like **wókash**" probably refers to the *taste* of this kind of food.

147, 5. **Kū'ktu.** This plant attains a length of about 6 inches.

147, 6. 7. **K̲áls** is the globular bulb of the **wítchpai** water-plant.

147, 8. **K̲ä'a, k̲ä'sh.** This plant produces a hard, whitish, farinaceous bulb, which is commonly spoken of as **ípo**, a Shasti term, and is one of the most important food-articles of the Oregonian Indians. To dig or collect **k̲ä'sh**: **k̲ä'shala, k̲ä'shla.**

[252] [825] 147, 9–13. **K̲ō'l**, also pronounced **k̲ū'l, gū'l, gúl**, is a kind of Aralia. The root is eaten only when roasted, and is then very nutritious, though spreading an abominable smell. This odor is so penetrating that, as alleged, the grizzly bear will attack nobody who smells after roasted **k̲ōl**; to this we may add the restriction: "if he is not very hungry." John D. Hunter mentions in his "Manners and Customs of Indians," etc. (Phila. 1823, page 370) that the Osages ascribe to the plant washoba-pesha the power of scaring away the black bear. This plant is an annual growth possessing sudorific and cathartic properties. Washobe is the black bear, mitchú the grizzly bear in that Southern Dakota dialect.

147, 9. **hū'mtcha gū'l**: "the **k̲ōl** in this condition," viz: in the ripe state. The **k̲ōl**-plant is ripe when the stalk becomes red or reddish.

[193] 147, 10. **méya.** Speaking of *many* women digging bulbs or roots, **stá-ila, stä'-ila** is the regular form; its proper signification is: "to fill up" "to fill" (the conical root-basket worn on back, **yáki**).

147, 10. 11. **pū'kguishamtat**: "to their old roasting place"; **púkuishamat** might stand instead. The locative suffix -tat, -at is here appended to a verbal substantive of **púka**, to roast, standing in the possessive case -am, and -u- is the infix marking past tense. The guttural k has become distended into kg.

147, 12. **ĕ'nt** or **ĕ'nd** for **énat**, conditional of **éna**. Instead of **ĕ'nt, ídshant** (for **ídshnat**) may stand in the Klamath Lake dialect.

147, 14. **Lupí'** etc. The import of this sentence is: "**L'bá** ripens in the month when autumn begins."

[285] 148, 1. **Má-i** is the common reed or tule-grass growing sometimes to the height of 8 to 10 feet. The shallow borders of the lakes in the headlands of Klamath River are full of this growth, which is one of the most important economical plants for the Indian. Women manufacture from it mats, dishes, baskets, lodge covers, nets, sacks, bags, and the young stalk yields in its lower part a palatable marrow.

*539 148, 2-4. Yánakänin for yannkäníni; cf. suffix -ni, -nini in Dictionary. mä'nsh for
262 mä'ntch. pä'shtak for páhasht ak, cf. pä'sht, 147, 17. for páhasht.

824 148, 5. Nú'tak. This grass belongs to the genus Glycerium, as identified by Dr.
192 E. Foreman, and produces a tiny, grayish bright seed of tchípash size. The flowers are of a light red color. The grass is found around the agency buildings and grows about one foot high.

148, 7. Páwash properly means *tongue.*

148, 11. Pû'ks or *camass.* Its bulb is one of the principal food-articles of all the northwestern Indians, but does not grow in profusion in the warmer portions of California. It is of the magnitude of the walnut, very saccharine and nutritious, ripens in May and June, and by the roasting or baking process described in the text becomes as hard as stone. The Máklaks call it after pû'ka *to roast,* the Shasti name is sók, the Pit River name ähualé, while the name kamas, "sweet," is of Nutka origin. The botanists call the plant Scilla or Camassia esculenta. Cf. *Note* to 146, 1.

148, 14. ípakt, metathesis of ípkat, the conditional of ípka to lie there, to remain.

[222] 148, 16. púlχuantch. The gathering of this pupa or chrysalid and of its caterpillar,
[462] the aχeshí'sh, is chiefly done by the women of the tribes, who find them imbedded at
[252] no great depth in the sandy ground around pine trees. Another chrysalid, the kûlí'ga,
is collected and roasted by them in the same way and tastes like eggs. kshû'n puetílank: putting grass under the chrysalids, not under the heated stones. The stones are replaced by other heated ones, as soon as they have cooled off; the larva assumes a black color after roasting and tastes like eggs. See púlχuantch in Dictionary.

[221] 148, 19. guiχakshä'migshta. The season of the year, when the exodus of the whole
[222] tribe to Klamath Marsh takes place, where pond-lily seed is collected for the winter,
[193] is about the middle of June. The ending -ta is an abbreviation of the case suffix -tat.
Three seasons are stated in the text, when the peeling of the inner or fibre bark of small pine trees is performed; of these the camass-season precedes the exodus to Klamath Marsh by a few weeks only, and the fishing season lasts from February to the end of the summer. Of course, the peeling of the kápka-pine coincides with the season when the sap ascends through the young tree. The bark is removed from about five feet to fifteen or twenty feet above the ground, and most of the beautiful pines treated in this manner are doomed to premature decay, though many survive the operation. The aspect of a forest with some of the pine trees peeled is rather singular.

148, 21. shánks hak, contraction of shánkish hak or ak.

149, 1. ka-tánian for ka taniáni "so much in width or extent." The bud of the táksish has a width of about half an inch. Cf. *Note* to 146, 1.

149, 3. 4. tók. This aquatic grass grows about two feet high; by ó-ushtat is meant, here and in tsi'kal: Upper Klamath Lake.

(194) 149, 3. pä'lpali, vocalic dissimilation of pálpali or pä'lpäli; cf. taktä'kli 149, 14.

149, 5. Tchí'psam is a prairie grass on which the brown tchípash-seed grows. This seed is extremely small, and it takes a long time before a sufficient quantity of it is
(178) gathered to afford a meal for a family. Still smaller is the nútak-seed, and both are striking instances of the persistence of the Indians in keeping up their old mode of living, when by agriculture and stock-raising they could procure provisions with infinitely less trouble and in much shorter time.

*539 149, 6. tü'ksh is probably the adessive case of tóke (ō) fire-place, hearth: tók-kshi.

262 824 192 [193]

149, 12. Tchuá is the long, cylindric root of the Sagittaria sagittifolia, an aquatic plant common in the West and East of the United States. In Oregon the term *potato* or wápatu (Chinook jargon) is most commonly heard for it. The name of Chewaukan Marsh, a sink and low ground situated east of Upper Klamath Lake, is a corruption of Tchuaχē'ni: "where the arrow-leaf is found." The flower of the wápatu varies between red, reddish and whitish.

149, 17. Tsuni'ka. The flower has a diameter from two to three inches.

149, 21. Kû'lχamsh is put on strings by the women and thus serves to attract the fish.

149, 21. ptchi'nk: after this word ought to be seen the picture of a tiny vegetal cylinder, about one inch long and slightly curved.

[386] 150, 1. Skáwanks or wild parsnip, a poisonous plant growing in wet places to the height of three feet.

150, 8. p'nä'sh, contracted from p'nálash, is the direct object (reflective) of shkukluápkasht: to guard themselves against becoming chapped by sun-burns. The wákinsh seems to be a kind of resin and furnishes a red paint, as does also the k'lépki.

E-UKSHIKÍSHAM KÍUKSHAM SHUÍ'SH SHUINŌ'TKISH TCHÍSH.

*539 533 755

INCANTATION SONGS OF THE KLAMATH LAKE PEOPLE.

1. *Introductory song:*

Yä'ka ní, yä'ka ní, yä'ka ní *etc.* ⏑ ⏑ ∸ | ⏑ ⏑ ∸ | ⏑ ⏑ ∸

I sing, I sing, I sing (in chorus).

2. *Song, reference unknown:*

Wiwiwá! ní shááwalsh wítnank! ⏑ ∸ | ⏑ ⏑ ⏑ ∸ | ∸ ⏑

Blown off! the plume-crest has disappeared from me!

3. *Song of the wind:*

Kanítala m'sh û shlewitaknû'la? ⏑ ∸ | ⏑ ⏑ ∸ | ⏑ ∸ | ⏑ ∸ ⏑
népaksh a-i ní'sh shlewitaknû'la. ⏑ ∸ | – – | ⏑ ∸ | ⏑ ∸ ⏑

Who, I wonder, is blowing out of my mouth?
The disease is emanating from my mouth.

4. *The conjurer's song:*

Tuá kí nû shatashtaknû'la? ⏑ ∸ | – – | ⏑ ∸ | ⏑ ∸ | ⏑
nä'paks nû shatashtaknû'la. ∸ | – – | ⏑ ∸ | ⏑ ∸ | ⏑
tuá kí' nû shatashtatχí'sh? ⏑ ∸ | – – | ⏑ ∸ | ⏑ ∸
nä'paks nû shatashtatχí'sh. ∸ | – – | ⏑ ∸ | ⏑ ∸

What do I remove from my mouth?
The disease I extract from my mouth.
What is the thing I take out?
It is the disease I am taking out.

*539
755
533

5. *Song of the woodchuck:*

Käila nû gutí'la nû –́ ⏑ | –́ ⏑ | –́ ⏑ | ⏑

I am descending into the ground.

6. *Little girl's song:*

Shmashmáyalti, shmashmáyalti – ⏑ –́ ⏑ | – ⏑ –́ ⏑

In quill-fringed buckskin dressed,
In porcupine-fringed buckskin dressed.

7. *Song of the washpálaks-fox:*

Ă'kală'kĕla nû, ă'kală'kĕla nû –́ ⏑ | – ⏑ | –́ ⏑ ‖ –́ ⏑ | – ⏑ | –́ ⏑

Long and slim I am, long and slim I am.

8. *Song of the fire-mantle:*

Lû'luksash nû shkutíya –́ ⏑ ⏑ – | –́ ⏑ | –́

In fire-flames I am enveloped.

9. *Song of the tuákish-crane:*

Nû shnû'lashtat nû tgelí'wa ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ ⏑

I stand upon the rim of my nest.

10. *Song of the blind medicine-girl:*

Tchatchĕlushkánka nû tchíutchiûsh shneχí'tko
– ⏑ –́ | ⏑ ⏑ ⏑ –́ | – ⏑ –́ | ⏑

I search the ground with my hands, find there the feathers of the yellow hammer and devour them.

11. *Another song of the same:*

Palák! ish hû lûlpalpalíat! ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | –

Quick! make ye eyes for me!

12. *Bird's song:*

Nû'sh pí'lan tiláluansha –́ ⏑ | –́ ⏑ | –́ ⏑ – ⏑

As a head only, I roll around.

13. *Song, reference unknown:*

Tuá pash nû? tuá pash ă nû? ⏑ –́ | ⏑ –́ ‖ ⏑ –́ | ⏑ ⏑ –́

What am I? what am I?

14. *Song, reference unknown:*

Há lúyam'na, nû lúyam'na ⏑ –́ | ⏑ ⏑ –́ | –́ ⏑ ⏑

This round thing I hold in my hand.

15. *Song of the long-tailed black marten:*

A wálχatchăka nû gatáml'χa –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑

I the black marten, I travel around this land.

*539
533
755

16. *Song of the skunk:*

Yámashtka nû tuituigídaha –́ ⏑|–́ ⏑|–́ ⏑|–́ ⏑

In the north wind I dance around, tail spread, festive and gay.

17. *Chorus song:*

Tuá kí nû k̲óga? ⏑|–́ ⏑ ⏑|–́ ⏑
nä'paks ai nû k̲óga. –́ ⏑ ⏑ ⏑|–́ ⏑

What do I suck out? The disease I am sucking out.

18. *Song of the boards:*

Pápkash huálta –́ ⏑ ⏑|–́ ⏑

Lumber-boards are rattling.

19. *Song of the lizard:*

Kí! kí'ya nû aíkana –́ ⏑|–́ ⏑|–́ ⏑ ⏑

Lo! thus I the lizard stick my head out.

20. *Song, reference unknown:*

Yámash ai nû'sh wílamnapka –́ ⏑|–́ ⏑|–́ ⏑|–́ ⏑

The north wind has followed me.

21. *Song of the black mouse:*

Tuá kí nû tashulóla? ⏑ –́|⏑ –́|⏑ ⏑ –́|⏑
nä'poks ai nû tashulû'la. ⏑ –́|⏑ –́|⏑ ⏑ –́|⏑

Through what do I pass with my paws?
My paws glide over the hair of the disease.

22. *Song of the washpálaks-fox:*

L'ékish, l'ékish gená –́ ⏑|–́ ⏑|⏑ –́

Crazed I am wandering.

23. *Song of the weasel:*

Shä'ka nû, shéka nû –́ ⏑ ⏑|–́ ⏑ ⏑

I am squealing, I am squalling.

24. *Song of the dog:*

Wátchag ai nû nû'kanka, –́ ⏑|–́ ⏑|–́ ⏑ ⏑
yámashtka nû nû'kanka. –́ ⏑|–́ ⏑|–́ ⏑ ⏑

I the dog am straying.
In the north wind I am straying.

25. *Song, reference unknown:*

Shlä'wish á-i nísh wílhua –́ ⏑|–́ ⏑ ⏑|–́ ⏑ ⏑

The storm gust dashes right on me.

*539
533
755

26. *Song, reference unknown:*

Mû'mëni gé-u stû'kish gi –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Heavy hailstones I possess.

27. *Song, reference unknown:*

Naínaya! ní'sh shléwish wítnank! ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́

I am shivering! the wind blows down on me!

28. *Song of the bug:*

Shaíχish a-i ní k̲óga –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑

I the bug, I bite and suck.

29. *Song of the mink:*

Mû'ashtka nû udumulípka –́ ⏑ | ⏑ –́ ⏑ | –́ ⏑ | –́ ⏑

I am swimming out while the south wind blows.

30. *Song of the young silver-fox:*

Wánam wéash nû wilamnápka –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | – ⏑

The young red fox I follow up.

31. *The incantation sings:*

Shuí'sh hátak nû géna nû

I the song I am walking here.

32. *Fox's song:*

Laláalashtala wiká nû ⏑ –́ | – ⏑ ⏑ ⏑ | –́ ⏑

I am blowing air from my flanks.

33. *Song of the tuákish-crane:*

Tuánχi, tuánχi, tuánχi, tuánχi . . . . . nû. –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

34. *Songs, forming refrains to song No.* 33.

a-ahahíya, a-aha-a-ahíya –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ ⏑ ⏑ | ⏑ –́ ⏑
a nû hé-e-i, a nû hé-e-i ⏑ –́ | –́ ⏑ ⏑ ‖ ⏑ –́ | –́ ⏑ ⏑

35. *Song of the disease:*

Tuá nû shlewílam'na? ⏑ –́ | ⏑ ⏑ –́ | – ⏑
népaks an shlewílam'na. –́ | ⏑ ⏑ ⏑ –́ | – ⏑

What thing do I blow around?
The disease I am blowing around in the air.

36. *Song of the grizzly bear's cub:*

Yaínatat nû eitaktnúla, –́ ⏑ – ⏑ | –́ ⏑ | –́ ⏑
lû'k̲am nû wéash gi. –́ ⏑ ⏑ | –́ ⏑ ⏑

On the mountain top I am peeping out,
Of the grizzly bear I am the child.

*539
533
755

37. *Song of the female wolf:*

Kă′-utchish gû′lû h′ílantana –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

I, the she-wolf, am rolling against (a tree!)

38. *Spoken by the conjurer while manipulating:*

Netá, netá . . . . hahayí-ía
Nenû′, nenû′ . . . . hahayí-ía

39. *Song of the tchiwititikaga-bird:*

K̲ú-i witíla, k̲ú-i witíla –́ ⏑ – | –́ ⏑ ‖ –́ ⏑ – | –́ ⏑

Fearfully the wind blows underneath here.

40. *Song of the blind girl:*

Lúashtka nû lû′tchipka, –́ ⏑ ⏑ ⏑ | –́ ⏑ ⏑
kăíla nákant ní lúyapka. – ⏑ | –́ ⏑ ⏑ | –́ ⏑ ⏑

In the fog I am straying blind,
All over the earth I am wandering.

41. *Song of the water-bug:*

Ádshi ádshi tcháya, ádshi ádshi tcháya –́ ⏑ | –́ ⏑ | –́ – ‖ –́ ⏑ | –́ ⏑ | –́ –

42. *Song of the grizzly bear:*

Kăíla nû hû shlû′tila –́ ⏑ – ⏑ | –́ ⏑ ⏑

I am scratching up the ground.

43. *Song of the little gray tchikass-bird:*

Yaínash a-i nû shlulóla –́ ⏑ | –́ ⏑ ⏑ – | –́ ⏑

I am wafted off from the mountain.

44. *Song of the skō′ks or spirit:*

K̲akó píla nû la-uláwa

Reduced to mere bones, I rattle through the air.

45. *Sung by the disease, found to live in water:*

Shléwishash nû tilutaknû′la

Breath I am emitting.

46. *Song of the grizzly bear:*

Tunépni gé-u wélwash gí, ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ –́
páltko gé-u wélwash gi. –́ | ⏑ –́ | ⏑ –́ | ⏑ –́

I have five water springs and (all) my springs are dry.

47. *Song of the black snake:*

Wámnaksh ai í′ nû tûnûlúla ⏑ – | ⏑ –́ | ⏑ ⏑ –́ | –́ ⏑

I the black-spotted snake am hanging here.

*539
533
755

48. *Conjurer's own song:*

Käilanti nû shí'lshíla –́ ⏑ ⏑ ⏑ | –́ ⏑ ⏑

I, the earth, am resounding like the roll of thunder.

49. *Bird's song:*

Nená nû, nená nû ⏑ –́ ⏑ | ⏑ –́ ⏑

I flutter along the ground (while walking).

50. *Song of the grizzly bear:*

Yaínalam shulúyualsh –́ ⏑ ⏑ – | –́ ⏑ –

51. *Woman's song:*

Shutpashuítk gûn snewédshash gî, –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑
shutpashuítk a ní snewédshash gî. –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Painted I am on the body,
I, a woman, am painted black.

52. *Song of the weasel:*

Gaíkash, gaíkash nuyámna –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑

Fooling, fooling I run around.

53. *Song of the gray fox:*

Nánuktua nû papí'sh gî – –́ | ⏑ ⏑ –́ | ⏑ –́ ⏑

Everything I can devour.

54. *The conjurer speaks as follows:*

Hû'masht	hûk	gēk	lupí'	kálkĕla,	hût	hûnk	tchí'ka-ag	tutíχólatk
Therefore	this (patient)		first	was hurt,	that		(his) mother	after dreaming

unák	pápka.	At	tchĭk	hûnk	kē'k	k̲'lékshashtala	télshampka.
early	ate.	Then		this (patient)		to the spirit-land	turned his face.

55. *Conjurer speaks:*

Kágga	waktála	î	nûshχē'ni	nía	hémkanksh	wáshî	liwátchamp-
What	(and) why then	you	towards me	a while ago	were speaking	indoors	to hold up (the

kîsh ?
patient) ?

56. *Conjurer's song:*

Tuátala nish hû lχetk̲núla ? ⏑ –́ | ⏑ ⏑ –́ | ⏑ – –́ | ⏑
gû'pal a-í nish lχetk̲núla. –́ | ⏑ ⏑ –́ | ⏑ –́ | –́ ⏑

What is coming out of my mouth ?
Black substance is hanging down from my mouth.

57. *Song, reference unknown:*

Lúash ai nû'sh a lû'lamnapka –́ ⏑ – | –́ ⏑ | –́ ⏑ ⏑ ⏑

Fog followed drifting after me.

*539
533
755
58. *Song of the turtle:*

Tuá ki nish lé-ula? ⏑ ⏑́ | ⏑ ⏑ ⏑ ⏑́ | ⏑

Which game did you play with me?

NOTES.

115
124
This long series of shamanic songs in use on the Williamson River was obtained from *Mary*, a young pupil of the boarding school of Indian children at the Klamath agency. When living among the Indians on the Williamson River she had heard all these songs very frequently, and in an interesting evening entertainment she faithfully reproduced the manipulations of the male and female conjurers upon a little rag baby lying on the floor on a bed made up of old blankets, the figure representing some poor suffering Indian patient. The other Indian girls of the school joined in a lively chorus every time when she had fairly started any of these incantations, and given the signal by clapping hands.

On the day following these incantations were dictated, translated and explained to me by *Minnie Froben*, assisted by Mary, and though both persisted in the statement that the order in which the songs are sung was quite immaterial, I present them here in the order in which I obtained them.

Each of these song-lines is sung many times by the conjurer, then *repeated* by the chorus a dozen times or more. The chorus varies the melody somewhat each time, but this musical variation is so slight and insignificant that the general impression of monotony is not dispelled by it. Quite a number of these songs have very pretty melodies, but by long repetition even these must of course produce tediousness and disgust; other songs have weird and strange tunes, others are quaint, but almost repulsive by their shrill accents; these may be said to form the transition to the mere howls and imitations of animal voices, which are frequent also in doctoring ceremonies, but more frequent in the war-shouts and funereal cries and wailings.

The animal or object of nature to which the conjurer attributes each of the song-lines was not remembered in every instance. Where this reference was obtained, it was added at the head of the song or song-line. The animals mentioned in these songs are all supposed to have been sent out by the conjurer to look out for the whereabouts of the *personified* disease, from which the patient is suffering, and whatever the conjurer sings about the animals refers to what he sees them doing while on their errand. On the distinction made between shuí'sh and shuinö'tkish cf. *Note* to song 9.

Kiúksam shuí'sh is not merely a conjurer's song, but a mysterious agency connected with a spell of preternatural power. This spell is not exclusively attached to a song sung by a conjurer, but it may be borne also by a dream, disease, by some drug, or by that kind of witchcraft which is called elsewhere the evil eye. Kiúksam shuí'sh is therefore a beneficial or destructive tamánuash agency, which when applied to a patient can cure him or make him worse; when appearing under the shape of a dream, it is a dream of good or one of bad augury.

The conjurer sometimes diversifies his songs, all of which are sung in the *minor* keys, by inserting spoken words relating to the condition of the patient and the effects of his treatments; specimens of this are given in 38. 54. 55. Parts of them are also repeated by the chorus.

*539 533 755 Many Indians do not understand all these songs, which contain many archaic forms and words, and the conjurers themselves are generally loth to give their meaning, even if they should understand them. Some songs are of a stereotypic application in the treatment of all or the majority of the maladies. A close familiarity with the habits of animals of the forest manifests itself throughout, as well as in the mythic tales.

*539 533 755 192 The translations added by me are not literal; they render the meaning of the songs in a free and paraphrastic manner. In the metrics the accentuated syllables designate a higher pitch of the singing voice.

153; 2. Literally: "I blew off the feather-crest."

153; 3. To read: shléwi witχnû'lank, seems preferable in this connection. Cf. 35.

[292] 154; 6. On grand occasions young women were in the habit of dressing in buckskin robes, fringed with porcupine quills (shmáyalsh). In a myth the bull-frog was reported to wear constantly this kind of dress, and hence originated a sort of proverbial locution: kó-e shmashmáyalti: "the bull-frog in the shmáyalsh-dress." Cf. shmáyam. Zoologists call this frog: Rana pipiens.

154; 7. This is called washpaláksam shul'sh, the medicine-song of the washpálaks-fox species, Vulpes velox. The exterior of this fox may be sketched by the words: ä'kelä'kĕla wátchag hû'tchnuk, a long-bodied dog is running or trotting. Cf. song 22.

154; 9. This is called the tuákSham shuinō'tkish or incantation sung by the crane itself through the mouth of the conjurer. Nobody could hear the bird's voice if the conjurer did not sing its song. A song, which the conjurer sings for himself and by which he does not interpret any animal or other object of nature, is called kiúksam shul'sh and is endowed with magic powers. In the West of the United States the tuákish is popularly known as shitepoke, in the East as fly-up-the-creek.

[825] 154; 10. The feathers of the yellow hammer are worn on neck as an ornament.

[301] 154; 12. This refers to a certain large bird not specified, which contracts its body, so that the head seems to be its largest part. When walking, the bird seems to roll around on the prairie. Pílan for píla nû.

154; 14. The object to which song 14 refers is not known.

154; 15. Walχátchaga is very probably, though not certainly, a kind of marten. Mantles were made of its fur. This rimed incantation is called walχátchkalam shuinō'tkish.

155; 16. Called: tchásHisham shuinō'tkish; melody very pretty. The diphthong ui is pronounced here as *one* syllable. Skunks, while running around, are in the habit of holding straight up their bushy tails, which are almost as long as their bodies.

155; 17. This pretty song is chanted by the choristers while the kiuks feigns to suck out of the body the tiny object which is supposed to have caused the disease, and before he gets it out. k̲óga, k̲óka means originally *to bite;* bite first, then suck the disease out.

155; 18. Pápkash is pronounced almost like pávkash; 144, 11. k̲ópk̲a like k̲óvka.

155; 19. Alludes to a peculiar nodding observed in lizards when running out of their holes and stopping at the issue.

155; 20. The animal to which this song refers is not known. Compare No. 16. 24. The literal meaning is: "The north wind blows around me from the distance."

155; 21. This song, with a beautiful melody, is the shuinō'tkish of a mouse species with pig-like proboscis.

*539 155; 22. l'ékah, lékah, distr. lélakah crazy, maddened, intoxicated. This song is
533 sung also: lē-é'kah, lē-é'kah gená: ⏑ –́ | ⏑ –́ | ⏑ –́ Cf. 154; 7.

755 155; 23. The weasel is squealing, because hunters have caught or trapped it.

192 156; 26. Probably refers to one of those birds to whom the power is attributed to bring about storms, fog, snow, or any change of the weather.

156; 27. Compare songs 2 and 3.

156; 28. This bug, perhaps a scarabee, bites the skin to suck out the disease from the wound.

156; 30. This is probably a song of the wind, not of the young silver-fox (as I was told), and I have translated it as such. The song No. 20 is analogous to it in every respect; the winds, which the Indians constantly compare with the spread of the disease, are frequently mentioned in these songs as blowing upon some animal or other object sent out by the conjurer to discover the whereabouts of the disease. Cf. No. 16. 20. 24. 25. 29. 30. 43. and 57.

156; 32. This song is said to allude to the circumstance that one fox's howl seems to sound like the cries of many foxes howling together. Lalálash are both sides of one and the same beast.

156; 33. With these monotonous sounds the tuákash or tuákish calls itself by its own cry: tuák, wák, tuák. Tuányi is: tuák ni gi "tuák I am crying." Cf. 154; 9. Two refrains to this line are formed by the two lines of No. 34.

156; 35. The *personified* disease spreads the germs of sickness through the atmosphere. This song is comparable to songs 3 and 45.

157; 37. The signification of h'ílantana could not be disclosed, but it seems to be similar to that of tílantana.

157; 39. This small bird is dark, and has a red or yellow neck.

157; 43. Speaks of a fog drifting away from the mountains and turning into a cloud, which is drifting also.

157; 44. The bones of a dead person's skeleton are supposed to rattle against each other, the spirit being here identified with the skeleton.

157; 46. Often sung wélwashi gi; epenthetic syllables are frequent in these songs, *e. g.* walyátchika in song 15.

157; 47. The wáměnigsh or wámn'aks, a species of Pityophis, has large black spots and frequently occurs in the Klamath country. Tunulúla means to hang down over something as over a rock.

158; 48. This is sung when water is poured over the patient. A more literal translation would be: "I am resounding within the ground."

[823] 158; 50. Yaínalam shulúyualsh means round, cylindric or globiform objects standing in a row on a mountain. The den of the grizzly bear is supposed to be in the mountains or on a mountain top. Cf. song 36. My informants did not know what the objects were which stood in a series, but if any religious notions were connected with them, we may compare the three sacred rocks standing on a mountain top in Peruvian mythology. These rocks were fetishes indicative of stone worship, representing a mother with two sons. Another myth mentions four of them, representing Catequil (the god of thunder), Viracocha, a sun god and a fire god. The song No. 50 is sung by the chorus while the kinks is dancing.

*539
533
755
302
193

158; 51. The paint was put on expressly for the dance and smeared across her breast or anywhere on body; gûn for kē nû, gē nû, vowel û inverted.

158; 54. These spoken words are also repeated by the choristers. The repetition is very long and noisy and winds up in a howling. tutiχólatko, after having ceased to dream. This would imply, that after dreams fasting must be observed as a religious custom. k̲'lékshashtala for the correct form k̲'lekápkashtala. This phrase occurs in 68, 8., and is explained in *Note*.

158; 55. The meaning is rather obscure, probably owing to omissions.

Kiúksham shuí'sh.

CONJURER'S INCANTATIONS.

115

Obtained from Chief Johnson and Sub-chief Dave Hill.

1. *Song of the disease:*

Nä'pakshtka hínui nû; k̲aluáshtat nû

By sickness I am prostrate; I am (now) up in the clear sky.

2. *Song of the woodpecker:*

Kóshash ká-a nû piupíutánna –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑

I am picking hard at the bark of a pine tree.

3. *Song of the túktukuash-hawk:*

Kuáta nû tchiliká nû ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑

I am pinching hard.

4. *Song of the white-headed eagle:*

K̲aluáshtat nû tchutchúa ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ ⏑

I am croaking high up in the skies.

5. *Song of the weasel:*

Käflash nû shuína a ni yána ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́

From under the ground I am singing.

6. *Song of the mink:*

Atín tchelä'wash géna ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́

Ripples in the water-sheet I am spreading far and wide.

7. *Song of the skunk:*

Té-i, té-i, ksiúlχa –́ ⏑ | –́ ⏑ | ⏑ –́ ⏑

With shortened steps I am dancing.

*539
533
755

8. *Song of the quiver:*

Yáhiash nû tadsí tadsí –́ ⏑ ⏑ | –́ ⏑ | – ⏑ | –́

9. *Song by a companion of the old frog:*

Kú-e weléḵash nû wélwash tchalekíya ⏑ –́ | ⏑ –́ | ⏑ ⏑ ⏑ –́ | ⏑ –́ ⏑ ⏑

An old frog-woman I sit down at the spring.

10. *Song of the gáwi-bird:*

Sháwalish haí nû shlatan. íya –́ ⏑ ⏑ | –́ ⏑ – ⏑ | –́ ⏑

A flint-headed arrow I am ready to dispatch.

11. *Song of the eagle-feather:*

Mû'kash a gí nû, gená nû, hō –́ ⏑ | ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́

I am the eagle-feather, I am going down, hō!

12. *Song, reference unknown:*

K̲ú-i hai nen ksíul'ka

I feel too bad for dancing.

13. *Song of the dwarf:*

Na'hnías naní naní naní-a a á nanía . . . . . . nanī, naní-ī-ā

14. *Song, reference unknown:*

Käfla nû spí'amna –́ ⏑ ⏑ | –́ ⏑ ⏑

I am dragging out dirt.

15. *Song, reference unknown:*

Sháppashti nû lak̲í gí

I am the lord of the sun.

16. *Song of the shaiχish-bird:*

Shaiχí'sh gúluaga lulamnóla ⏑ –́ | ⏑ ⏑ –́ | – –́ | ⏑ –́ | ⏑

I the little black female bird am lost and strayed.

NOTES.

*539
533
755
192

162; 1. By others this song was given as follows: Nä'paks kinuína ḵalowát nû: "I the disease am meandering through the skies." This variant is evidently preferable to the one above.

162; 2. In the Sahaptin language of the Yákima, Washington Territory, a certain bird is called piúpiu; the Klamath Lakes call a spotted kind of woodpecker shpíu'hpush. Both terms are derived from an onomatopoetic radix piu, imitating the picking at the bark by the woodpecker.

162; 3. The túktuknash or fish-hawk, Pandion carolinensis, occurs in large numbers on the lakes of the Klamath highlands. Like that of many other birds, its Indian name is derived onomatopoetically from its cry.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

* 539 533 755 192 [825]

162; 4. Of the yaúχal, white-headed or bald eagle, Haliaetus leucocephalus, another conjurer's song was obtained. Cf. 165; 5.

162; 5. The wording of this song could not be obtained with certainty.

162; 6. Stands for: ati tchelā'wash nû géna.

162; 7. té-i, té-i has no meaning, but simply serves to beat the measure when dancing with short steps.

163; 8. This song is said to be that of the quiver (tókanksh) and its purport the same as that of No. 7. Yáhiash is a kind of aquatic bird.

163; 9. A similarly worded song is in the Modoc collection, given by Toby Riddle.

163; 10. Sháwalsh is here lengthened into sháwallsh for metrical reasons.

163; 11. This is a favorite song of a kíuks on the Williamson River, called Skúkum Doctor (stout doctor). Given by Dave Hill, also 12 and 13.

[776] 163; 13. Foot-prints not larger than those of a baby are sometimes discovered in the higher mountains of the Cascade Range. The Indians refer them to a dwarf called na'hnias, whose body can be seen by the conjurers of the tribe only. The dwarf gives them his advice for curing the sicknesses of others and inspires them with a superior kind of knowledge.

163; 14–16 were dictated by an Indian whom I found at Linkville.

163; 15. The name of the animal, probably a bird, to which this conjurer's song refers was not obtained. Cf. shápsam ptchíwip in Dictionary.

E-UKSHIKÍSHAM KÍUKSAM SHUÍ'SH.

* 539 533 755 [115]

INCANTATIONS OF THE KLAMATH LAKE CONJURERS.

OBTAINED FROM "SERGEANT" MORGAN.

1. *Song of the Lake:*

Ktsálui gé-u é-ush

My lake is glittering in azure colors.

2. *Song of the rain-storm:*

Gé-u a-i népaka népka,
gûlkásh gé-u hû shuísh.

The disease produced by me has arrived,
I am the storm and wind and this is my song.

3. *Song of the conjurer's arrow:*

Gé-u a hû't hănă'sish

This here is my long magic arrow.

4. *Song of the North wind:*

Yámsam gé-u gē'-ish kápa -́ - - ⏑ | -́ ⏑ - -

I am the North wind, and in my path I am irresistible.

*539
533
755

5. *Song of the yaúkal-eagle:*

P'laína nû kshakí'dsha –́ ⏑ | –́ ⏑ | –́ ⏑

High up in the skies I describe my magic circles.

6. *Song of the little sucker:*

Yénash ai nish aléwish wíta –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Now the wind-gust sings about me, the yĕn-fish.

7. *Words sung by the East wind:*

Yéwa, yéwa, yéwa, yéwa –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

Easter, easter, eastern, eastern.

8. *Song of a black snake:*

Kámtilagam gé-u génhuish –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ –

This is mine, the black snake's, gait.

9. *Conjurer's kat'hiáwash-incantation:*

Gé-u hût ké-ish kat'hiáwasam

Thus I walk when I tie up the hair.

10. *Song of the black ground-mouse or kōlóyua:*

Munána nû shuiná

Down in the dark ground I am singing my strain.

11. *Conjurer's song of the rope:*

Kĕnúks a-i nû stû'nχi-uapk ⏑ –́ | ⏑ –́ | ⏑ –́ | – ⏑ ⏑

I will pull a rope from my entrails.

12. *Gray wolf's song:*

Ké-utchish ai nû shuí'sh gi –́ ⏑ ⏑ | –́ ⏑ – ⏑ | –́ ⏑

I am the gray wolf magic song.

13. *Song of the female lizard, kí'a k̲álu:*

Skû'lala gé-u kä'la kíalam ké-ish

The land on which I, the female lizard, am treading, belongs to the lark.

14. *Song of the male lizard, kí'a lak̲i:*

Ktsálui kí'alam gé-u ké-ish

When I the lizard am walking, my body is resplendent with colors.

15. *Song of the kilídshiksh-duck:*

Tselćwa gé-u é-us ⏑ –́ | ⏑ –́ | ⏑ –́ –

In my lake ripples I am spreading.

16. *Song of the yellow jacket or kí'nsh:*

Nû' ai nen nûtû'yamna

Here I am buzzing around.

*539
533
755

17. *Song of the young deer's claws:*
Kodaí'ngs a gé-u wálta
My deer-claws are rattling.

18. *Song of the kshí'kshnish-hawk:*
Wéash á-i nû kshûkátkal ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ ⏑
I carry my offspring with me.

19. *Song of the pelican or kúmal:*
Há wíshtkak nû núyamna – ⏑ –́ | ⏑ –́ ⏑ ⏑
Noisily I am blowing around.

20. *Song of the swan:*
Kû'sham gé-u wítchtaks
By me, by the swan, this storm has been produced.

21. *Woman's song:*
Kutchí'ngshka hû' mû'luesh
The feet of a young deer are my medicine-tools.

22. *Song of the male k̲áls or k̲álχalsh-bird:*
K̲ā'lsam gé-u lúmalaks
This is my song, the kálsh-bird's, who made the fog.

23. *Song of the female k̲áls-bird:*
K̲álsam kû'lo gé-u lû'malaks
Like my consort, the kálsh-bird, I produce fog at will.

24. *Song of the otter or kólta:*
Conjurer: Gútkaks gé-u népk
The small-pox brought by me, the otter, is upon ye.
Chorus: K̲illí'lga kóltam génuish
The otter's tread has whirled up the dust.

25. *Conjurer's song:*
K̲ó-idsi ai nû shuí'sh gí
I am a conjurer's fatal song.

26. *Funeral song:*
Lû'luksam nû skû'tchaltko
I am now wrapped in the garments of fire-flame.

27. *Song of the mámaktsu-duck:*
Gutitgúlash gé-u népka ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑
Belly-ache is the disease which I carry along with me.

*539
533
755

28. *Song of mpámpaktish-duck:*

Gutí'tkuls gé-u nä'paks

Belly-ache is the disease I am bringing on.

29. *Song of the South wind:*

Mû'ash ai nû' shuí'sh gí, ⊥ ⏑ ⏑ | ⊥ ⏑ | ⊥ ⏑
käíla nû wikánsha. ⊥ ⏑ ⏑ | ⏑ ⊥ ⏑

I am the South wind's magic song and sweep over the earth.

30. *Song of the conjurer's implements:*

Tchí hû tché-us mû'luash;
kóltam gé-u hû mû'luash,
sχí'l gé-u hû mû'luash.

So looks the medicine-tool taken from the yellow hammer;
This is my curing-tool, that of the otter;
This is my curing-tool, that of the otter-skin belt.

31. *Song of the black náta-duck:*

Nû ai náta shuí'sh

The náta-duck is now singing about itself.

32. *Song of the nú'sh-tilansnéash-bird:*

Lû'paksh gé-u mû'luash ⊥ ⏑ | ⊥ ⏑ | ⊥ ⏑ ⏑

White chalk is my medicine-tool.

33. *Song of the pipe:*

Kátchkalam mû'luash,
pä'ks gé-u mû'luash.

The smoking pipe is my medicine-tool, the implement for the tobacco.

34. *Song of the scoop:*

É-usam mû'luash,
pála hû gé-u mû'luash hû.

This scooping-paddle is my curing-instrument, that tool used on the lake.

35. *Song of the póp-tchikas bird:*

Póp-tsikas nû' shuí'sh gí ⊥ ⏑ ⏑ | ⊥ ⏑ | ⊥ ⏑

I am the incantation of the little póp-tsikas bird.

36. *Song of the shkä'-bird:*

Nû ai nen nû shuí'sh gí, ⊥ ⏑ | ⊥ ⏑ ⏑ | ⊥ ⏑
p'laína nû kakí'dsa. ⊥ ⏑ | ⊥ ⏑ | ⊥ ⏑

I am a magic song and circle high above the earth.

*539
533
755

37. *Song of Old Marten or Skélamtch:*

Nû' ai nen aggí'dsha ⊥⏑|⊥⏑|⊥⏑

I go up and stick fast to the tree.

38. *Song of spirits' walking-stick, or skú'ksam hä'kskish:*

Skû'ks ai nû sí'kamba í

Leaning on a staff, I the dead man's spirit am traveling.

39. *Song of the large black woodpecker:*

Sk̲û'kashak nû nä'pka

I the young woodpecker have brought on sickness.

40. *Song of the strap made of otter skin (sχí'l):*

Sχí'l ai nû mû'luash, ⊥⏑⏑|⊥⏑⏑
sχí'l ai nû shuí'sh gi. ⊥⏑⏑|⏑⊥⏑

I the skin-strap am a conjurer's tool, I am a magic song.

41. *Song of the sχí'b-bird:*

Sχí'pa nû shuí'sh

Of the sχíb-bird I am the song.

Or, in other words:

I the sχíb-bird am singing about myself.

42. *Song of the storm-blast:*

Sléwish ai nû wuyámna

I the storm-wind I wind around.

43. *Song of the lark:*

Nánukash gé-u nä'paksh,
Skólälam gé-u nä'paksh.

The disease brought on by me, the lark, spreads everywhere.

44. *Song of the spú'm or female shkä'-bird:*

Käflash nû shñolóka

I am snapping at the ground.

45. *Song of the sweat-lodge stick-hole:*

Steaúsawalks gé-u shuí'sh gi ⊥⏑⏑|⊥⏑⏑|⊥⏑

This is my song, that of the stick-hole.

46. *Song of the loon or táplal:*

Tselé'wash nish shiálamnû taplálas

I am the loon and my waves follow me.

47. *Song of the bodily pains:*

Tatktí'sh ai nû nä'pka

I the painfulness have come upon ye.

*539
533
755

48. *Song of famine or hunger:*

Tiä'mish ai gé-u nä'pka

The pangs of hunger I carry about.

49. *Song of the West wind:*

Tχalamtálkni k̲ú-idsi nû
sléwish hû widsápka.

I the West wind, high above the earth I blow as a pernicious wind-gust.

50. *Song of the túktukuash fish-hawk:*

P'laína nû kshakédsha,
k̲aló nî kshékansha.

High up in the skies I soar and turn my circles.
Through the clear skies I am carrying my prey.

51. *Song of the tsákĕnush, an aquatic bird:*

Kä'lash ak nû wúya tsákĕnûsh

I the tsákĕnush would like to fly over the country.

52. *Song of a gray aquatic fowl, called tchákiuks:*

Shaíkish ai nû yû'ta ∸ ⏑ | ∸ ⏑ | ∸ ⏑

I the shaíkish I walk with ponderous steps.

53. *The little boy's song:*

Tsákiag a-i nû shuí'sh gî,
lĕmé-ish a-i nû shuí'sh gî.

This is my own, the little boy's, song;
About the thunder I am singing now.

54. *Song of the tsántsan-hawk or kingfisher:*

Tsála-esh nû k̲ók̲a tsántsan – ⏑ ∸ ⏑ | ∸ ⏑ | ∸ –

I the tsántsan-bird am eating up the salmon.

55. *Song of the weasel or tsásgai:*

Ktsálui nû génhuish

While walking I shine in my multiple colors.

56. *Weasel's magic song:*

Tsaskáyam gé-u kä'la,
guyúma ké-u kä'la.

Mine is this ground, the weasel's,
Muddy is my ground, the weasel's.

57. *Song of the tcháwash-fish:*

Tsáwas ai nû shuí'sh gî

I the tsáwas-fish am singing my own song.

* 539
533
755

58. *Song of the tsí'ktu-hawk:*

Yámash a nû shuí'sh;
yámash a gé-u shuí'sh.

About the north wind I am singing.
About the cold winds I am singing.

59. *Tsisχiχi-bird's song:*

Nû ai nen nû shuí'sh gi

I am singing about myself.

60. *Song of the tsiutsíwăsh-bird:*

Tsiutsiwă'sam kē'sh múlua

The snow made by me, the tsiutsíwăsh-bird, is ready to arrive.

61. *Song of the blue jay, or tsχă-utsχă'-ush:*

Sankáwaltk ai nû shuí'sh

High-crested I sing my song.

62. *Song of the large black vulture:*

Tchuaísh ai nû naggí'dsa

I the vulture describe my circles in the air.

63. *Song of the wákash-crane:*

Wákas ní tcheklé̂la

I the wákash-crane crouch on the water's edge.

64. *Song of the young wákash-crane:*

Wakáshak nû nä'pka

The disease brought on comes from me, the young wákash-bird.

65. *Woodpecker's song:*

Wákwakins wínta wálashtat

I, the woodpecker, am holding *fast* the tree-stem.

66. *Song of the wá'hlas-tree:*

Walásh ai nû wawíkanka ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ ⏑

I the pole-tree am shaking my crown.

67. *Song of the wá-u'htuash-duck:*

Wa-u'htû'ssam gé-u nä'pka ⏑ ⏑ –́ | ⏑ ⏑ –́ | –́ ⏑

A sickness has come, and I the wá-u'htuash-duck have produced it.

68. *Song of the mallard-duck:*

Wä'-aks ai ní tchéwa –́ ⏑ | –́ ⏑ | –́ ⏑

I the mallard float on the water's bosom.

69. *Song of the wéiwash-goose:*

Gé-u ai hû't wítchtaks

This tempest is my work.

*539
533
755
70. *Song of the little wipĕlí'wash forest-bird:*

Wipĕli'wash nû shuí'sh gi,
wuiplé'wĕsh nû shuí'sh.

My own song I sing, I the wipĕlíwash-bird.
I the wuipléwash am singing about myself.

71. *Song of the witkatkish-hawk:*

Gé-u aí hû tú' sáwals, –́ – | –́ – – | –́ ⏑
witkatkísam gé-u sáwals. –́ ⏑ | –́ ⏑ | –́ – | –́ ⏑

My head-crest this is, it is that of the witkatkish-hawk.

NOTES.

[825] The incantations obtained from Morgan are mostly of the kind called shuinō'tkish, and a large number of them are attributed to birds. Some of them probably exist in a more explicit form, which was not remembered, and the rhythmic or musical form *539 was obtained of a part of them only. A literal translation of these song-lines is an 533 impossibility in most instances, if their sense has to be rendered in full; I have there-755 fore furnished only paraphrastic interpretations. The list is alphabetic, and was 172 arranged after the names of the animals, or other personified objects, to which the incantations are attributed. Many of these songs are referred to in the "Subject List of Incantations" given by Morgan.

164; 1. Ktsálui, to be resplendent with colors, is mainly said of objects showing a blue or purple tinge: pú'ksam shláps ktsáluitko, the camass-plant has a bluish color. This verb is also used when speaking of the rainbow; of the lizard: 165; 14., also of the weasel's fur-skin: 169; 55.

[779] 164; 3. The use of these conjurer's arrows is mentioned 73, 5.

164; 4. Yámsam for Yámasham; cf. *Note* to 111, 4. Of the personified North wind the Indians say "he lives up in the mountains". On the north side the basin of [193] the Williamson River is closed up by high mountains. Gé-ish and génuish, génhuish means the action of going and that of having gone, or the present and the past going; both were translated by "*gait*", "*tread*", a term which does not differ much from the real meaning. Both terms also occur in the songs obtained from "Doctor" John, and are mainly used of quadrupeds, amphibians, and reptiles.

164; 4. kápa probably for gátpa (nû), "I have come".

[136] 165; 6. The yĕ'n sucker-fish is quite abundant in the lakes of the Klamath highlands and has been identified by Prof. E. D. Cope as the Catostomus labiatus.

165; 7. yéwa. In Morgan's series of incantations there are song-lines on wind-gusts, tempests, rain-storms and on the winds blowing from each of the four cardinal points of the compass. These latter are not positively stated to be producers of dis-[821] ease, though they are dreaded on account of their force and violence. The East wind (yéwash) blowing over the alkaline or volcanic, arid lands of Southern Oregon sings: yéwa, yéwa (nû) which does not only signify "I blow from the East", but also "I am howling".

165; 11. Feigning to draw a rope or string from their own posteriors is a trick sometimes resorted to by doctoring practitioners to make a disease disappear.

*539
533
755 165; 13. It is by no means certain whether the above is the full wording of this song or not.

192 165; 16. nen involves the idea: "you hear it yourselves." Cf. 167; 36. 170; 59.

[534] 166; 17. kódsinksh was in this connection explained by lílhanksam stë'ksh. Conjurers' rattles are made of deer's claws.

166; 18. This hawk is a kind of sparrow-hawk, Falco sparverius.

166; 20. Compare the song of the weíwash-goose: 170; 69.

166; 21. This song of a female conjurer or "doctress" is quite analogous to the song 166; 17.

166; 22. The ḳála flies around in cold nights followed often by foggy mornings, hence the belief that it makes the fog.

166; 25. Compare the gray wolf's song, 165; 12., which forms alliteration to this.

166; 26. Refers very probably to the cremation of the dead.

[778] 167; 30. In line 2 the same object is alluded to as in line 3, kóltam sχī'l. This is a broad strip of dressed otter skin, ornamented in various ways with shells, feathers, bird-scalps, etc. To all these objects a magic power is attributed severally, and as they are now all united on one strip of skin, this strip must unite the magic powers of them all. The conjurer suspends the sχī'l on his neck and lets it dangle over his chest or back, according to the manipulations in which he is engaged at the time. It is considered as one of the most powerful of all the curing tools or múluash.

167; 32. Alludes to the grayish-white color of this bird, which burrows underground. This bird is also mentioned in 154; 12. and *Note*; cf. also 132, 7. 8.

[193] 168; 41. Sχī'pa is the abbreviated form of the possessive case in -am, as in wásha wéka 105, 9. and *Note* to 105, 7.; in: nī'l wéksa, 144, 1. cf. 165; 13.

168; 44. Interpreted by others: "I am scolding and threatening the earth".

169; 50. Another túktukuash-song is contained in 162; 3. cf. *Note*.

169; 52. Shaíkish is another name given to the tchákiuks.

169; 54. The kingfisher or Ceryle alcyon is called in Klamath Lake tchántchan, tsántsan, tchánshan after its cry: tchătchătchă, and chiefly feeds on salmon.

169; 56. The second line was referred by "Sergeant" Morgan to the otter. Cf. 177; 13.

170; 58. This alludes to the name of the bird, which imitates its twittering.

170; 62. This bird circles in the air to discover fish on the lake's surface and to pounce upon them. The tchuaísh is the red headed vulture or black buzzard: Cathartes aura. The Indian name is an imitation of the bird's cry.

170; 63. 64. The wákash-crane is identical with the tuákish, the name being derived from its cry. These birds creep along the edge of the water in search of small fish. Compare the tuákish-songs 154; 9. 156; 33. 34.

170; 65. This song is much better expressed in the series of Modoc incantations: 174; 13. Here as well as there alliteration is perceptible.

[193] 170; 67. After gé-u, the subject of the sentence, nä'paks or the disease, is omitted. In the name of the duck the final -s, -sh is geminated here in the possessive case, to stand for wa-u'htŭ'asam.

[194] 170; 68. In the onomatopoetic word wä'ks the dissimilation of the vowel into wä'-aks is frequently observed. Also pronounced wékash.

170; 69. The weíwash- or waíwash-goose is a long-necked white bird, commonly known as snow-goose: Anser hyperboreus.

MODOKÍSHAM KÍUKSAM SHUI'SH.

000

INCANTATIONS OF MODOC CONJURERS.

OBTAINED FROM TOBY RIDDLE IN THE MODOC DIALECT.

1. *Shkū'ks or spirit's incantation:*

P'laitalántnish nû shuína ⏑⏑–́|⏑–́|⏑–́⏑

I am singing to the heavens above.

2. *Another of the same:*

Nulidshá nulidshá nulidshá ⏑⏑–́|⏑⏑⏑–́|⏑⏑–́
ḵo-idshántala kāilátala ḵailpákshtala,—tchiá.
⏑⏑–́|⏑⏑⏑–́|⏑⏑⏑–́|⏑⏑⏑–́

I am sliding, slipping, sliding,
Towards that wretched land, towards that burning region, to remain there.

3. *Another of the same:*

Tuá hak tála? tuá hak tála?
hû'-ûtak tála, hû'-ûtak tála!

What was it? what was it. It was he, it was himself!

4. *Song of the dry water-spring:*

Wélwash kaí nish palálla –́⏑|–́⏑|–́⏑|–́⏑

Indeed my spring has dried up.

5. *Song of the old frog:*

Kó-e welā'kash nû tchalekíya, ⏑⏑⏑–́|⏑–́|⏑⏑–́⏑
welwáshtat nû tchalíka. ––́|⏑–́|⏑–́⏑

I, the decrepit she-frog, sit down here by the water spring.

6. *Song of the wind:*

Shléwish nû vuyámna, –́⏑|–́⏑|–́⏑
nánukash nû vuyámna, –́⏑⏑|–́⏑|–́⏑
p'laína nû vuyámna. –́⏑|–́⏑|–́⏑

I the wind am blowing,
Everywhere I am blowing,
In the skies I am blowing.

000

7. *Song of the five female elks:*

Wáti lelíwa, lelíwa; wáti lelíwa, lelíwa
–́ ⏑ ⏑ | –́ ⏑ ⏑ | –́ ⏑ ‖ –́ ⏑ ⏑ | – ⏑ ⏑ | –́ ⏑
The knife lying at the end of the knife range.

8. *Song of the fisher, a species of otter:*

Tuátala nish í shudshí'pka? niniá, niniá
⏑ ⏑ –́ | ⏑ – ⏑ –́ | ⏑ – ‖ ⏑ ⏑ –́ | ⏑ ⏑ –́
tuátala nish í shudshí'pk í? neineyá, neneá
⏑ ⏑ –́ | ⏑ – ⏑ –́ | ⏑ – ‖ ⏑ ⏑ –́ | ⏑ ⏑ –́
Why then do you pursue me so? You flutter and beat your wings.

9. *Young otter's song:*

K̲óltalam nû wéash géna ámputka;
at ké-u guíχish käfla nilíwa,
at kaí lemléma käfla.
The otter's offspring, I plunged into the water,
When I emerged from it, the ground blazed up,
The earth was shaken to its foundations.

10. *Weasel's song:*

Tcháshgai nû géna, –́ ⏑ ⏑ | –́ ⏑
käfla nû gak̲ála, –́ ⏑ – ⏑ | –́ ⏑
tcháshgai nû gak̲ála. –́ ⏑ – ⏑ | –́ ⏑
I the weasel am starting;
On the soil I draw my circles;
I the weasel I travel in circles.

11. *Song of the weasel:*

Ê-eni nû wítka shkō'ksam steínash –́ ⏑ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑
In the spirit-land I blew out from me the heart of the shkō'ksh.

12. *Mink's song:*

Klí'pa nû genálla –́ ⏑ | –́ ⏑ | –́ ⏑
I the mink am starting off.

13. *Song of the woodpecker:*

Wákwakinsh nû wínta, –́ ⏑ | –́ ⏑ | –́ ⏑
p'laí télshnan wapálatat; –́ ⏑ | –́ ⏑ | –́ ⏑ | –
wákwakinsh nû wínta, –́ ⏑ | –́ ⏑ | –́ ⏑
nû yána télshnan wínta. –́ ⏑ | –́ ⏑ | –́ ⏑ | –
The woodpecker, I am sticking fast,
Upwards looking I stick to the tree-stump;
The woodpecker, I am sticking fast,
Downwards I look, and hold myself.

ooo 14. *Horned owl's song:*

Mú'kisham nû lú'lpatko, ⊥ ⏑ ⏑ ⏑ | ⊥ ⏑ ⏑
ude-událkatko ké-u wakí'sh gi. ⊥ ⏑ ⏑ | ⊥ ⏑ ⏑ | ⊥ ⏑ ⏑ | ⊥ ⏑

I possess the horned owl's sharp vision; my roof-ladder is of speckled wood.

15. *Spider's incantation:*

Káltchitchiks nû luyámna, ⊥ ⏑ ⏑ | ⊥ ⏑ | ⊥ ⏑
p'laína nû luyámna. ⊥ ⏑ | ⊥ ⏑ | ⊥ ⏑

I the spider am going up; upwards I travel.

16. *Patient's song:*

Kăíla nû shuinálla ⊥ ⏑ | ⏑ ⏑ ⊥ ⏑

I am singing my Earth song.

17. *Another of the same:*

At gé-u steínash wakídaha!

Now my heart has returned.

18. *Another of the same:*

Átûtû huggí'daha!

Now it has turned!

19. *Another of the same:*

Gé-u hû gépkash kăíla shuáktcha

After I had arrived (in the spirit land) the Earth wept and cried.

NOTES.

The Modoc series of conjurer's songs obtained from Mrs. Riddle is one of the most valuable of the collection of songs, because it gives them all in their full length and original shape. The majority are in use among the Klamath Lake conjurers also.

The songs 3. 9. 17. 18. 19. are delivered rather in a speaking than in a singing modulation of the voice.

173; 1. Sung by a "doctress" who has sent out into the air a deceased person's spirit to search after the disease of her patient.

173; 2. Rime, alliteration and assonance are combined in this interesting song, which is said to be sung by female conjurers. A spirit is sent underground to prospect for the disease. A tripartite division of the song-line is found in none of the other incantations obtained. Kailpákahtala is a dialectic form for kélpōkahtala; after this word a short pause is made in singing.

173; 3. The conjurer asks the returning spirit: "what did you find to be the cause of the disease, when going below the ground?" The answer is: "he was the cause of it"; *he* is some subterranean deity, or genius, probably Múnatalkni.

173; 4. Probably attributed to a grizzly bear; cf. 157; 46.

173; 5. The frog is prospecting for the disease around and within the water. Cf. 163; 9.

000

173; 6. The wind, while entrusted with the search for the disease, is blowing through the skies and sweeping over the earth.

174; 7. The mythic elks who sang this were said to be endowed with human faculties. Allusions not traceable.

174; 8. This is an incantation which would seem to proceed rather from a duck or goose beating its wings while chasing another, than from a fisher. First line Modoc, second, Klamath Lake.

174; 9. The animal had found the *disease* in the water and chased it out to the shore; when there it set the shore on fire and the ground was shaken up under its destructive, ravaging steps.

174; 11. The weasel, returning from its errand, reports to the conjurer, that having found the cause of the patient's disease to be a wicked skû'ks's heart, this was brought by the weasel to the spirit land and breathed out, to be left there. This is the most probable interpretation of all those suggested, for song 11. is said to form a sequel to the weasel's song 10.

174; 13. The kinks had sent the red headed woodpecker to prospect for his patient's disease in the atmosphere. Alliteration and assonance in profusion.

175; 14. *Meaning:* My eyes are well fitted for the discovery of the patient's disease, hovering in the air, for they are acute, being those of the owl; I am just stepping up my lodge-ladder, the speckled bark of a tree, on the search for the disease. Alliteration is a prominent feature in this incantation. Cf. *Note* to 123, 1. 2.

175; 15. Sent by the conjurer, the spider goes up in the web to prospect for the disease. The verb shows the prefix l-, because the body of the spider is round-shaped.

175; 16. On falling sick, a spirit orders the patient to sing and repeat this Earth-song line for hours.

175; 17. "I have recovered the use of my senses."

K̲ÁK̲ASHAM KÍUKSAM SHUÍSH.

533
[115]

INCANTATIONS.

GIVEN BY K̲ÁK̲ASH OR "DOCTOR JOHN" IN THE KLAMATH LAKE DIALECT.

Kálo. Kálo nû na shă'shatk, slă'wish nû na shă'shatk, nû k̲álo p'lái nû
wítsa.
Kätla. Kätla ai nû shuī'sh gī; kätla ai nī wálta, kätla nû ai shawálta.
Lä'k. Shás̈hapsh na shă'shatk; shás̈hapsham génuish, gé-u génhuish nû
géna.
Witä'm. Nû ai witä'm gī, nû ai shúina witä'm; nû ai na shă'shatk an, at an
géna: géna an atí, gémpēle an.

*539 *Witä'm k̲ilo.* Witä'm ai ní géna; nû a k̲û'luak, k̲û'luak ai n géna.

533 *Witämága.* Nû a wí'tämak, hótchna n wí'tämak; witämák a n; lápi ai nû witä'mak.

Wátsag. Nû ai hû wátsag; shuí'shank, nû ai shuíná u wátsag.

Wī'hlág. Nû ai wíl'hág, hótchna n wí'l'hag; géna an wí'l'hag, atí' ni géna nû; ná-asht shä'shatk wilhága n.

Walχátchka. Nû ai walχátchka, walχátchka n géna; käíla ní géna, nû walk̲átchka.

Kŭ'lta. Nû a kû'lt gí; kû'lta i ni géna, kû'ltam at hûk génuish.

Pĕ'p. Pä'p a nû gí; pä'p an a nû shéshatk; nû a gátpa pä'p, atí ní hû'dshna, nû a hû'dshna.

Tcháshgai. Tcháshgai nû ká-ika, tcháshgai nû géna.

Klí'pa. Klípa nû ai shuí'sh; koyóma klí'pam génuish.

Gí'wash. Nû ai gí'wash, p'laína nû ai hŏ'tsna; lä'pi ai ní gí'wash, shéshatk nû gíwash.

K̲ák̲. Nû ai k̲ä'k̲ gí; sáwals gé-u yá-uya.

Wékwekash. Wékwekash ai ní shahuáltampk; nû wékwekash slû'ka, sháwaltchnish slû'ka wékwekash.

Tsántsan Nû ai tsántsan shuí'sh gí; nû na shä'shatk tsantsaná-ag, nû ai tsántsan shä'wa n.

Shké. Nû ai shgé gí, hû'ntsna a nû, tiä'muk a hû'ntsna, nû a hû'ntsna, mä'makla nû shnû'kuapk, huntsámpĕluapk a nû; nû a k̲élä'wi, tchaggáya nû.

Naní'lash. K̲álowat shidshí'yamna nanílash.

Pí'shash Nû ai pí'shash, píshash ná-asht shä'shatk; hût nä'sht shä'shatk pí'shash; guyántsa pí'shash, nû guyántsa.

Shné-ish. Shné-ish an nä'sht shä'shatk.

Táplal. Nû a-i taplál gí, nû'sh a-i shläwí'ta, kä'mat a-i shläwíta.

Mpámpaktish. Mpámpaktish an shiunóta nû, k̲'lekátk an shnayä'na.

Káwiaga. Nû a-i káwiag, akí'ntsn an káwiag.

Tsíälsh. Tsíälsh nû a hû'tsna; gé-u nû káluish.

Tseléyash. Nû a tseléyash shuí'sh gí; tselä'yash mish k̲ók̲a.

Tchŭ'pksh. Ná-asht tchkásh tsû'pkish, nû a na shä'shatk, nû ai mû'ni kiä'm gí.

Nχáka. Nû kitchkán nû an nχáka géna.

*539
533
Kû'tcha-aga. Wínua nû a k̲û'tsag, shéshatk k̲û'tsag; pákish wák kû'tsag.
Wekétash. Nû ai weketásh gí; wéketa nû shahualtámpka, nû shahualtámpka, nû wekétash shéwa.
Mánk̲uga. Ná-asht shä'shatk, mánk̲ag shä'shatk.
Kaknólsh. Gä' a gé-u káknûlsh, gé-u hût káknûlsh; nû shlä-ípële káknulsh, p'laíwash káknulsh.
Pápkash. Pápkash wálta gé-u a gé-ish; wálta gé-u gé-ish pápksham lû'lp; k̲ä'gi gé-u pápkash gé-ish.
Spû'klish. Nû ai spû'klish, ná-asht shä'shatk.
Shläkótkish. Gé-u a shläkō'tksh, gä' kí hû shlakō'tkish; wudsí'tsí ánku, túm udsí'tsí; túm í'lχí, túmi ánku, túmi gé-u ánku gí.
Pä'ksh. Shuí'sham gé-u pä'ksh; kátchgal gé-u shuí'sh.
Welékag. Nû ai welä'kag; nû a tchía welä'χatkank; gë'k a lû'lp, gë'k a múmuatch.

NOTES.

The majority of these songs are destitute of any interesting and characteristic features, and being of easy interpretation I gave them without translation, adding, however, the necessary remarks in the Dictionary. These phrases are common-place repetitions of some shamanic ideas current in the tribe, and are given in a low jargon or technical slang redundant in elisions and contractions. Only a few of their number [193] are rhythmical. The pronoun nû, I, is often repeated three times in one sentence, in the form of ní, nû, an (a nû), ank (a nû gí), ua (nû a).

*539
533
192

Of the thirty-seven objects which have given origin to these songs sixteen do not occur in the shamanic songs given by other informants and two are given here under other headings: the *sky*, paíshash (under kálo), and the *marten*, Skélamtch (under pä'p). I have arranged all the songs in categories of natural objects.

[825]

K̲ák̲ash also furnished a series of limbs and organs of certain animals which were supposed to exercise supernatural powers, and therefore were made the subject of a shuí'sh, shuinótkish, or incantation. They are as follows: of the *black bear*, the head, snout, paws, fur and heart; of the *dog*, the head, hair, fur, ears, tail and paws; of the *weasel* (tchásligai), the head, eyes, snout, nose, chin, long hair, paws and tail; of the *mink*, the paws, snout, fur, tail and heart; of the *shná-ish-duck*, the head and legs; of the *salmon*, the head and fins; of the *fly*, the wings (lás, black or white) and legs. About the *young antelope* and *old woman's spirit* (wíl'hag and welékaga) see below.

176; 2. wítsa. When the clear sky is said to blow with a shrill sound (wítsa), and thus "to sing its own song", this means that the winds are blowing fiercely through the air, high above the ground.

176; 3. This song on the grumbling or rattling earth (wálta, huálta) was made by Doctor John on the subject of his own imprisonment, the cause of which I have related elsewhere.

176: 4. Shásh́apsh, Sháshapamtch is the mythologic name of the grizzly bear: 118, 1.

*539
533
192
[194]

177; 2. "There are two of us black bear cubs" refers to the circumstance that in mythologic tales two cubs only are found to belong to one bear family. Compare what is said of the gíwash, 177; 14. and *Note* to 118, l. 7.

177; 5. The name of the young antelope is very differently pronounced. Its ears (mumú'atch wil'hágam) form the subject of a shui'sh.

177; 13. Koyóma. The same idea is met with in 169; 56. 166; 24.

177; 14. gíwash (the *i* pronounced short) is the long, gray-colored squirrel.

178; 7. Pápkash. This song of the lumber-boards was more completely remembered than the one quoted 155; 18.

178; 12. Pä'ksh. A similar tobacco-pipe song is to be found 167; 33.

[254] 178; 13. welékag. Here as well as in all other portions of the globe the idea of sorcery and witchery is associated with that of old women (welékash, old woman; welekága old woman's spirit). Welä'χatka, to travel around or appear as an old woman's spirit.

NÁNUKTUA KIÚKSAM SHUI'SH.

*539

tsé-usam lä'sh, witkakísham lä's.
[illegible]-feather, hawk's feather.

Kat'sitsutsuéas kiúksam shuísh, kat'hiáwash, lû'luks-skû'tchaltk, 8
Snow-flake witchcraft is a doctor's song, hair-tying, in fire-coiled,
skû'ksam hä'kskish, hä'näsish.
spirit's walking-staff, conjurer's arrow.

NOTES.

124 All these subjects of tamánuash songs were obtained pell-mell and jotted down in a confusion. A clear insight into the quality of the songs known to this Indian could be attained only by classifying them into categories, as those of natural agencies, *539 533 192 the winds, rocks, genera of animals, plants, tools and articles of native dress. Morgan had heard all these songs sung in former years, but when I met him he could remember the texts of those 71 songs only, which are to be found from page 164 to page 171. Many songs of this subject list are sung by the Modoc conjurers also.

Certain names of uncommon species of animals could not be rendered in English for want of information; to others the Dictionary will afford the best clue.

193 866 179; 4. káwam or káwam is a possessive case, requiring as its complement ámpû or kóke, kokeága. To bathe in eel-springs is deemed to be of great influence on character and personal courage, for the constant peril of being bitten by crabs, snakes and other reptiles must necessarily make the bathers scornful against sudden pains.

179; 6. tsû'χatχant, or in its full form: tsûχatχántko, has to be connected attributively with the foregoing word: tsákiag tsû'χatχantko "a restless boy, a little boy unable to keep quiet on his seat."

193 180; 1. tsaskáya wéash, kólta wéas show the apocopated form of the possessive before a vocalic sound. This is another example of the rule that Klamath seeks rather than avoids *hiatus*. Cf stuá-usa-wálks 168; 45; 180; 23, and *Note* to 168; 41.

180; 5. spû'm; said to be the female of the fat shkü'-bird. There exist conjurers' songs about both, which I have given in this volume, page 167; 36. 168; 44.

180; 10. póp-tchíkash seems to mean the "drinking *or* sipping bird" (cf. pópo-i).

180; 17. Lä-a-ámbotkish, "the one which refuses to drink" seems to be a newt, Amblystoma, according to the description given of it by the Indians.

180; 17. kóä. The toad or bull-frog tamánuash song is reputed to be the most efficient of all these incantations.

180; 18. Ámpuam lák is a film-like organism moving rapidly in spirals or meanders through the water, and supposed by rustics to originate from the long hair of horses. The primary signification of ámbutka, to be thirsty, is "to return to the water", and the distributive form a-ámbutka here indicates repetition.

180; 19. The list of *plants* is very small when compared to that of the animals, and embodies economical plants only.

180; 22. wásh means *place of residence* in general; but since all the objects in this category refer to the sweat-house, it may be referred to a removal of earth in the floor of this structure; lúloks is the fire burning in the centre of it.

181; 1. tsé-usam skû'tatk: "dressed with feathers of the yellow hammer or red shafted flicker."

COOING AND WOOING.

I.

1. Yuyulinnē, yuyulinnē, yuyulinnē

I have passed into womanhood.

2. I-unēksχē'ni a yulína –́ ⏑ ⏑ –|–́ ⏑|–́ ⏑|–́ ⏑

After sunset I get unwell.

3. Gä' lish kaní hudshótchipka? ⏑ –́|⏑ –́|⏑ –́|⏑ ⏑

Who comes there riding towards me?

4. Génu í gít', o-ólka, kinhiä'na! = ⏑ ⏑ –́|⏑ –́|⏑ –́|⏑ –́ ⏑

My little pigeon, fly right into the dovecot!

5. Ginála hólakank; átūtū pä'χtgí ⏑ –́|⏑ –́|⏑ ⏑|⏑ –́|⏑ –́ ⏑

This way follow me, before it is full daylight!

6. At mísh mbushä'aluapka lákiam wéashash gí'aht
⏑ –́|⏑ –́|⏑ ⏑ –́ ⏑|–́ ⏑ ⏑|–́ ⏑ ⏑ ⏑

I want to wed you, for you are the chief's son.

7. Ká-a mísh nû ká-a ní mbushéaluapka, ⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́ ⏑
hûmámasht túma tuá gí'tkuapka. ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ ⏑

Very much I covet you for a husband,
For in times to come you will live in affluence.

8. *She:* Tatá í n'ish tuá woχówe, woχówe, woχówe?
He: Ê-ukík pí'la éwank, éwank, éwank!
⏑ ⏑ –́|⏑ ⏑ –́|⏑ –́ ⏑|⏑ –́ ⏑|⏑ –́ ⏑
–́ ⏑ ⏑|–́ ⏑|–́ ⏑|–́ ⏑|–́ ⏑

She: And when will you pay for me a wedding gift?
He: A canoe I'll give for you half filled with water.

9. Wéwanuish kahiéwuk tála kékekanka –́ ⏑ ⏑ ⏑|⏑ –́ ⏑|–́ ⏑ ⏑|–́ ⏑ ⏑

He spends much money on women thinking to obtain them easily.

10. Múshmush shû'dshipka káwantk tchílloyága –́ ⏑|–́ ⏑ ⏑|–́ ⏑|⏑ ⏑ –́ ⏑

The poor youngster, he is driving one cow only.

11. Géntala ká-i gaíkanka púshpushlish hishuákshash!
–́|–́ ⏑ ⏑|–́ ⏑ ⏑|–́ ⏑ ⏑|⏑ –́ ⏑

It is not that black fellow that I am striving to secure!

*539 12. Î-u nénak yan'wán ī, –́ ⏑|–́ ⏑|–́ – ⏑
533 í-u nénak̲ lólalχ' ī. –́ ⏑|–́ ⏑|–́ – ⏑
832

They say, that you are abandoned,
They say, that you are homeless.

13. Nánuk kalí'napka wéwan'sh, nā'dshek 'mutchéwatk tut'hiéna

All women are dead; only an old man is tottering about.

14. Ká-a tídshi snawédshash ní'sh shû'-uashipk!
⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́

That is a pretty female that follows me up!

15. Wák ī núsh gítk vulálat inotílā? ⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑ –́|⏑ ⏑

Why do you send me to sleep under the shadow of the cottonwood-tree?

16. Nû'sh ak gí'ntak ī wítchnoka –́ ⏑|–́ – ⏑|–́ ⏑ –
lúlula wítchnoka –́ ⏑ ⏑|–́ ⏑ –

That 's because you love me that you rattle around the lodge.

17. Tcháki mísh guní'ta, –́ ⏑ ⏑|–́ ⏑ –
tcháki mísh guní'ta, –́ ⏑ ⏑|–́ ⏑ –
huwaliéga lulú-uash skútatk, –́ ⏑ ⏑|–́ ⏑|–́ ⏑ ⏑|–́ –
lulú-uash skútatk huwaliéga. –́ ⏑ ⏑|–́ ⏑|–́ ⏑ ⏑|– –

A youngster beyond your home, a young man beyond your lodge
Ran up the hill, wrapped in fogs, ran up the mount while robed in mists.

18. Kayáta hû'lhe, hû'lhekanka tcháki, (*bis*) ⏑ ⏑ ⏑ –́|⏑ –́|⏑ ⏑ ⏑ –́|⏑
kayáta lû'li, lû'likanka tcháki. (*bis*) ⏑ ⏑ ⏑ –́|⏑ –́|⏑ ⏑ ⏑ –́|⏑

Into many of the little houses ran the boy,
Roughly he touched many of the little houses, the boy.

19 Gé-u lak̲í wayṓ'sham stû'tχantk hû't

My husband has the voice of the white goose.

20. Gé-u lak̲í yókikam shkutántki

My husband is dressed in the feathers of the jay-bird.

21. Yúkikam stû'tχantk gé-u lak̲í –́ ⏑ ⏑|–́ ⏑|–́ ⏑ ⏑|–́

My husband has the voice of the mocking-bird.

22. Pálpali watsátk̲a hushólalχa

He is bouncing around on a white horse.

23. Tatsā'lka wáts snukátkank ⏑ –́|⏑ –́|⏑ –́ ⏑

He pets the horse before he grasps him.

24. Táplal wó-a hû'nûank mû stû'tχantko

Loudly cries the spotted loon while skimming the waters.

25. Wí-uka hulí'lχank skû'le huntchípka – – ⏑|⏑ –́ –|–́ ⏑ ⏑|–́ ⏑

The lark flies towards me grazing the ground and stopping every little while.

*539
533
832

26. Wák í nûsh gíug wetû', wetû', ⏑ ⏑ ⏑́ | ⏑ ⏑ ⏑ ⏑́ | ⏑ ⏑́
i-á-uka hû'lhiank wetû', wetû'. ⏑ ⏑ ⏑́ | ⏑ ⏑ ⏑ ⏑́ | ⏑ ⏑́

Why did you become estranged, estranged,
By running in neighbors' houses estranged, estranged!

27. Wák wennfluta nûsh gí'tk?
wák í nûsh gí'tk wennflota?

Why have you become so estranged to me?

28. K̲ó-idsi mák̲laks hŏ'lalk̲ tchawí'k sanáholing

A wicked man approaches fast, desirous of a fight.

29. Shenúyatko ní wáti luyä'nitki

I flee before the man who tramps around in the lodge, knife in hand.

30. K̲ó-idshi wátsag shkanákapka k̲ók̲uapkug,
k̲á-i ní shanáhual nû k̲ók̲tkinshkiuk. ⏑ ⏑ ⏑́ | ⏑ ⏑́ | ⏑ ⏑́ ⏑ ⏑ | ⏑́ ⏑ ⏑ ⏑
⏑ ⏑ ⏑́ | ⏑ ⏑́ ⏑ | ⏑ ⏑́ – | ⏑ –

That vicious dog assails me and will bite,
But I prefer not to scold him for it.

31. Kä'-udshish topínkan wókanka, ⏑́ ⏑ ⏑ | ⏑ ⏑́ ⏑ | ⏑́ ⏑ ⏑
yámat téluitgank wókanka. ⏑́ ⏑ | ⏑́ ⏑ ⏑ | ⏑́ ⏑ ⏑

The younger brother of the gray wolf is howling,
After having gone North he is howling.

32. Wásh a léka gí'tk gû' n'sh húyaha ⏑́ ⏑ | ⏑́ ⏑ | ⏑́ ⏑ | ⏑́ ⏑ | ⏑́

The prairie-wolf full of anger runs away from me.

33. Wásh leká gítk washólalχ tchíkŏlank wátsat
– ⏑ ⏑́ | ⏑ ⏑ ⏑́ | ⏑ ⏑́ | ⏑ ⏑ ⏑́ | ⏑

The maddened prairie-wolf gets away riding on his horse.

34. Wásh léggatχ ní'sh húyaha,
wásh í léggatk' kú nísh húyaha! hu-í-yähä!

Crazy-minded the prairie-wolf flees me;
Maddened in his senses he runs away to a far-off distance.

35. K̲ó-idshi wátch genuála, ⏑́ ⏑ ⏑ | ⏑́ ⏑ ⏑ | ⏑́ ⏑
hai yóshinko, yó-osink! – ⏑́ ⏑ ⏑ | ⏑́ ⏑ ⏑

A vicious steed has gone out; he is lost, he is strayed!

36. Tatá mísh kaní lápukni gĕnálla?

Who has touched you at both places?

37. Á nû toks shiwága shéwa, ⏑́ ⏑ ⏑ | ⏑́ ⏑ ⏑ | ⏑́ ⏑
káyutch mísh pátchnam palaléant. ⏑́ – | ⏑́ – | ⏑́ ⏑ ⏑ | ⏑́ –

I hold you to be an innocent girl, though I have not lived with you yet.

*539
533
832
38. Támûdsh pásh nû túmēna, ⊥⏑|⊥⏑|⊥⏑⏑
wátchagalam wéash shū'walsh túmēna. ⊥⏑⏑⏑|⊥⏑|⊥⏑|⊥⏑⏑

Over and over they tell me,
That this scoundrel has insulted me.

39. Gétala stû' newálχa! ⊥⏑⏑|⊥⏑|⊥⏑
tuátala tséyalalχ' î? ⏑⊥⏑⏑|⊥⏑|⊥⏑

Right ahead I follow the uphill path!
Why then do you swing the body around?

40. Waíwash gandíla shiwákshash,
shíwamptchash waíwash gandíla.

White geese saw a woman hiding,
Saw an old maid hiding in the grass.

41. Túhush ō wíllaslīna, ⊥⏑⏑|⊥⏑–⏑
wílhaslasna, wíllaslīna. ⊥⏑⏑⏑|⊥⏑–⏑
túhush ō wíllaslā, ⊥⏑⏑|⊥⏑⏑
wílhaslasna, wíllaslā. ⊥⏑–⏑|⊥⏑–

The mud-hen sprawls on the top;
On the top it rests, it slides from the top.

42. Wī-ilti nû shotelō'la, ⊥⏑|⊥⏑|⊥⏑|⊥⏑
púmam nû u-ásh goyéna. ⊥⏑|⊥⏑|⊥⏑|⊥⏑

I am rolling up the wī'l, and shall walk around in the beavers' den.

43. Kû'lsh kuleótank kí' nak ĕn gí', ⊥⏑⏑|⊥⏑|⊥⏑⏑–
múne kuleótank kí' nak ĕn gí'. ⊥⏑⏑⏑|⊥⏑|⊥⏑⏑–

The badger entering his den makes nak, nak, nak,
The fat (badger) entering makes nak, nak, nak.

44. K̲á-i welí'sht î mish shmákalpsh gí'sh shápa; ⊥⏑⏑|⊥⏑⏑|⊥⏑⏑|⊥⏑
wéwanuish gíntak shéwal, shéwal. ⊥⏑⏑|⊥⏑|⊥⏑|⊥⏑

Just now you affirmed that hairless you were,
But the women say, that hairy you are.

45. Nápal ai nā'd shuntówa-udsha ⏑⊥|⏑⊥|⏑⊥|⊥⏑⏑

We are throwing eggs at each other.

46. E antléya máyas ā

II

000 47. Yuyulinē'pka, yuyulinē'pka ⊥⏑|⏑⊥⏑‖⊥⏑|⏑⊥⏑
48. Yunigshχē'ni yulína

000 49. Wénni taína, wénni taína, ⏑ ⏑ –́ ⏑ | ⏑ ⏑ –́ ⏑
wénni taína . . . . . . ihí'-u- ī- i- ī- ū!

A different young woman I am now; ihí-u!

50. Tát i wáktch hûk a télak shayantíldsha? ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ –́ ⏑

Whence have you carried off that (man's) waistcoat?

51. Uná mish sha luelóla tchaggágatat netílapkash
⏑ –́ | – –́ | ⏑ –́ – | – – –́ | ⏑ –́ ⏑ | ⏑ –́ ⏑

Long ago they killed you when you lay under the serviceberry bush.

52. Tchítchaluish kintála, –́ ⏑ ⏑ | –́ – | –́ ⏑
wéwanuish k̲a-igóga. –́ ⏑ ⏑ | –́ ⏑ ⏑ | –́ ⏑

Young chaps tramp around;
They are on the lookout for women.

53. Hinawála! hinawála! ⏑ ⏑ –́ ⏑ ‖ ⏑ ⏑ –́ ⏑
wátchagam wéash, wátchagam wéash, –́ ⏑ ⏑ | –́ ⏑ ‖ –́ ⏑ ⏑ | –́ ⏑
mû'at genō'ga, mû'at genō'ga. –́ ⏑ ⏑ | –́ – ‖ –́ ⏑ ⏑ | –́ ⏑

Shake your head! you son of a bitch, and go South.

54. *Girls to boys:*

K̲á-i mish nû wítchta tchilluyágash
hû'kank k̲ailéak akútash;
k̲á-i nû shanáhuli hû'mtcha hishuátchγash.

Boys to girls:

K̲á-i nû shanáhuli kó-eptcha snawédshash,
kókuapkash lû'lp gípkash.

Girls: Young man, I will not love you, for you run around with no blanket on;
I do not desire such a husband.
Boys: And I do not like a frog-shaped woman with swollen eyes.

55. Kánt lak̲í! gíuga shlóa shlaníya! ⏑ –́ | ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑

You say you are rich! and you don't even spread a wild-cat's skin!

56. Kō'pe bunû'tchatko stû'pat wintíla;
nû'sh shana-úlitko nû'toks mish k̲á-i shaná-uli.

Lying near the stove you are going to drink coffee; although you wanted me for a wife, I do not want you for a husband.

57. Shínuitko húyaha, –́ ⏑ | –́ ⏑ | –́ ⏑ | –
wénnitko húyaha. –́ ⏑ | –́ ⏑ | –́ ⏑ | –

After c— she went to hide; the widow, she hid herself.

58. Mû'ni wenuítko gélash shipalkánka –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

The stout widow is stalking around intent upon the business.

NOTES.

*539 533 832 I. Erotic songs obtained from Chief Johnson, Minnie Froben, and others, in the Klamath Lake dialect. The twelve songs obtained from Minnie Froben are among the prettiest and most melodious, as for instance 9. 16. 17. 18. 23. 26., and the eighteen songs dictated by Johnson are of importance for the study of manners and customs, viz: 6. 7. 8. 10. 11. 19. 20. 28. 29. 41. 42. 43 etc.

With the Indians all of these and many other erotic songs pass under the name of *pilpil* or puberty songs. They include lines on signs of womanhood, courting, love sentiments, disappointments in love, marriage fees paid to parents, on marrying and on
*539 conjugal life. Some love songs have quite pretty melodies. A few songs of the present
533 interesting series of song-lines seem to treat of commonplace subjects only, as 22. to 24.;
832 28. to 31., while others apparently contain nothing but heartless mockeries and satiric
192 strictures, like 9. 28. 40. 44. But they all refer in fact to love-making and kindred sentiments, the satiric lines confirming the proverbial inclination of lovers to fight among themselves. I have deemed appropriate to gather all these songs under a heading which unmistakably expresses their real purport.

[194] 182; 1. The accent is laid sometimes on first, sometimes on second syllable. This word is abbreviated from yuyulinë'pka, as it occurs in the Modoc pilpil song. The event mentioned here is followed by a dance-feast; cf. shúyuχalsh, and 134, 21.

182; 4. ginhiéna "inside" means into a secluded spot, lodge or enclosure. O-ólka, ó'laka is the diminutive of ó'lsh, the grayish pigeon with the plaintive voice.

182; 7. gitknapka, a contraction of gitko gi-uápka i.

[583] 182; 8. Pay a wedding gift is equivalent to purchasing a girl from her parents for a handsome consideration.

[193] 182; 11. Sung by women. The original as given to me does not contain the negative particle: Géntals nû haíkanka púshpushlish hishuákshash.

183; 12. yan'wán i stands for yanhuáni i.

183; 13. kali'napka: they are not only "dead but out of sight", as the suffix -apka indicates. This being an erotic song-line, kalínapka simply means that the females looked for are either asleep or absent, and not deceased, as kalína would seem to indicate. 'mutchéwatk for kémutchéwatko; cf. 186, 5.

183; 14. 15. These two songs follow a purely anapaestic metre, No. 15 adding two acatalectic syllables to its three anapaests. Compare also the first line of 182; 7. with one supernumerary syllable. As for the contents of 183; 15. compare the analogous Modoc song 186; 51.

[194] 183; 17. Melody very engaging. In lúluash the second u is redoubled for metrical reasons. Dactylic rhythm prevails here, in 16, and in 182; 11.

183; 18. That is, while he was seeking young girls inside the kayátas. Melody very beautiful.

[193] 183; 19. wayósham, possessive case of waíwash, q. v.

183; 20. shkutántki stands for skútatko gî or shkutanátko gî: "he is wrapped in."

183; 21. The much more so, because he is in his festive garb, the pátash and lás stuck on his headdress.

184; 26. Melody very pretty. A young woman addresses these words to a lover.

184; 27. Sung by young women who have fallen out with their beaux.

*539 184; 28. Said to be an erotic song.

533 184; 29. luyä'nitki contracted from luyä'nitko gi. Cf. *Note* to 183; 29.

832 184; 30. kóktkinshkiuk. The proper meaning of this verb is "to set upon like a
192 dragon-fly". Shanáhual is an uncommon form for shanahō'li, the long ō being resolved
[193] into its component sounds. Cf. náwal, and 184; 35.: gennála for genō'la.

184; 31. Why did the wolf howl? The reason given is that he could not meet anybody. This wolf is a loving young man who was looking out for women.

184; 32. Sung by one woman and repeated by a female chorus. This song-line treats of the abandonment of a female by her husband or lover for some reason.

184; 33. Pretty melody. The song refers to a lover disappointed in his affections.

184; 33. tchíkla wátsatka is preferable to and more frequent than wátsat, wátchtat, cf. 183; 22. Alliteration is perceptible in this song-line.

184; 34. The wásh is the lover of the girl who sings this song; the lover is compared to a prairie-wolf on account of his importunity and lack of moderation. Comparisons of lovers with quadrupeds and birds are frequently met with.

184; 35. yóshinko for yó-ishiank ō, yó-ishiuk hū: he is running astray.

[193] 184; 37. shiwága. In the objective case sometimes inflected like snáwedsh *woman* 90, 11. sometimes as a diminutive noun, as here, and 88, 10. In 185; 40. shiwákshash stands incorrectly for shiwágash, through phonetic analogy with shiwamptchash in the same song.

185; 39 to 44, perhaps including 45, have a literal and direct meaning, and besides this are intended to convey an indirect meaning, which is of an obscene character. The same may be said of songs 15 and 51.

185; 41. This melodious song alludes to the habit of mud-hens to rest and sprawl on the top of the waves; wílhaslaana depicts their motions while on the wave-top,
[199] willaslina the sprawling observed while they sail down from it. With slight phonetic variations, this same melody is also sung as follows: Tóhosh ō willaslin; willaslaana, willaslina; willasli ín.

185; 42. wí'l seems connected with the diminutive word wí'haga, *young doe*.

[193] 185; 43. ki' nak ěn gi', stands for gi' nak, nen gi: "he cries nak, so he cries"; assuming that ěn is abbreviated from nen.

185; 45. This is a "dream" song.

185; 46. Pilpil song worded in another than the Máklaks language.

000 II. Erotic songs obtained from Toby Riddle and J. C. D. Riddle in the Modoc dialect. The Modoc pilpil songs obtained are all of a satiric character.

185; 47. See Klamath Lake pilpil songs 183; 1.

185; 48. See Klamath Lake collection of pilpil songs 183; 2.

186; 49. Pilpil tune sung by girls. Tsína is equivalent to t'éna, tsiniwá-ash etc.

186; 50. A song repeated for hours by young Modocs; it is of the true pilpil kind.

186; 51. Originally a pilpil song, but sung now by children playing hide and seek.

186; 52. This is a very popular and prettily tuned Modoc song.

186; 53. Sung by Modoc girls who feel themselves importuned by their lovers. Often the boys join them by singing it in chorus. This well-meant advice of sending the boys to the South, no doubt to the Pit River country, is to keep them at a distance, for the song refers to the appearance of the first signs of puberty. Watchágalam is full form of watchágam, for which wátcham is sometimes incorrectly substituted.

000 186; 54. This satiric *carmen amœbæum* is one of the longest pieces in the collection and contains words of reprobation addressed by disappointed girls to their admirers. Sung in chorus by both sexes, with frequent dacapos after different tunes. The suffix -ash repeats itself at the end of every line and in kókuapkash.

186; 55. This little iambic improvisation is very aphoristically and indistinctly worded, but is endowed with perhaps the prettiest tune of all songs in this collection. It is an apostrophe of a newly married wife to her husband, seeing herself deprived even of the most common comfort, a small tanned fur-skin, to repose on and to avoid the dampness of the bare soil.

186; 56. A lover is taunted on account of his predilection for the white man's habits. The Modocs say this is a song of the Klamath Lakes.

186; 58. Admits of no literal translation.

---

522

SONGS OF SATIRE.

I.

1. Kátchkal û'yank amníyamna –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

He goes around giving away sticks of tobacco, and is very noisy about it.

2. Gēt genō'la tsiálash patsō'k Yamakí'shamkshi

– – –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑

This man has started out to feed on salmon among the northern Indians.

3. Tû'sh hu wiká nénu shésha waíwash tchílamuu?

–́ ⏑ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑

Where is it, that close by on a hill waíwash-geese are crowding together?

4. Gé-u káni vû'lk̲ashti wátch hushótchipka? ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ ⏑

Who rides up to me on my horse, borrowed of me?

5. Tidshá k̲ók̲atk i shéwa, hashuátan' i! ⏑ – –́ | ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑

You think you are finely dressed; then mind your own dress!

6. Vû'lχashti kilí'wash shkútatk u'hlutuína

He dresses in a borrowed woodpecker-blanket and trails it along on the ground.

7. Ká tal hû'k mû shétaluatk? –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑

Kē' lish tok walχátchkatko gûlí –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | ⏑ –́

Who is he, the alleged wealthy man?
She has entered the house of a poorly dressed husband.

8. Lelahówitko wátch wuχóyi –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑

Slow-running horses he paid for his wife.

*539 9. Ámĕta téwank vû'ya teíniwash –́ ⏑ – | –́ – | –́ – | –́ ⏑ ⏑
533 The young girl shakes her body when planting the camass-stick into the ground.
522 10. Ámĕta yä'kuank vúyamna –́ ⏑ – | –́ ⏑ – | –́ ⏑ ⏑
Shaking her body she broke the camass-spade.
11. Lák̲iam pé-ia mat sha käfla kíwalapáta
–́ ⏑ ⏑ | –́ – | –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | –́ –
The chief's daughter, they say, was dragged along the ground.

12. Î haktchámpesh wénni tchikólalχa, –́ ⏑ | –́ – | –́ ⏑ ⏑ | –́ ⏑ ⏑
klítisham wéash wénni tchikolálχ' î. – | –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ ⏑
You always strangely stride on on your long legs.
The crane's progeny, you walk strangely long-legged.
13. Ê-ukshiwash tenuyága hä'la-a hála –́ ⏑ ⏑ | –́ ⏑ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | ⏑ ⏑
A young woman from Klamath Marsh is swallowing, swallowing.
14. Wika-télantko tchä'lish páwa hû ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ –́ | ⏑ ⏑
Short-faced like a porcupine that fellow is eating.
15. Lúelat hû'nksh hí't; yánta, yánta –́ ⏑ ⏑ | –́ – | –́ ⏑ | –́ ⏑
Kill ye that fellow on the spot! down with him, down, down!
16. Kä'utchish gû'lo sámĕnaki' wŏ'n lak̲í ⏑ ⏑ –́ | ⏑ ⏑ –́ | ⏑ ⏑ ⏑ –́ | ⏑ ⏑
When the female wolf has devoured the elk-buck she cries for more.
17. Shunuí-uya shuáktcha ⏑ ⏑ –́ | ⏑ ⏑ ⏑ –́ | ⏑
I feel unwell and hence am sobbing.

II.

000 18. Ledshántak wiwakní'ka; gaígaikanka ⏑ –́ | ⏑ –́ | –́ ⏑ | ⏑ ⏑ –́ | ⏑ ⏑
They whipped a telltale; he is now sobbing.
19. Bí'nash mût hû hlívash tilankánsha! –́ ⏑ | –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑ ⏑
The root-basket, they say, is swinging to and fro on Bí'na back.
20. Ló-i lóyan lóyak, ló-i lóyan lóyak
21. Ê-ukshikni tenuyáash halá, halá-a ⏑ ⏑ ⏑ –́ | ⏑ ⏑ –́ ⏑ | ⏑ –́ | ⏑ –́ ⏑
A maiden of the Klamath Lakes is swallowing, devouring.
22. Níggă heúĕ héyo, ní'ggă héyo héwe – ⏑ | –́ ⏑ ⏑ ⏑ ‖ – ⏑ | –́ ⏑ ⏑ ⏑
túmi níggă, túmi níggă –́ ⏑ | ⏑ ⏑ ‖ –́ ⏑ | ⏑ ⏑

NOTES.

*539
533
522
The feelings which dictated these sarcastic song-lines are those of derision, satire and criticism. The majority are of a drastic, some even of a crude and very offensive character, scourging mercilessly the infirmities observed on fellow-men. Many of them

*539 also pass as puberty songs, but I have preferred to class these under the heading of
533 songs of satire. Some are sung with melodies, others are spoken and recited only.
522 I. Satiric songs obtained in the Klamath Lake dialect from Chief Johnson, Minnie Froben and others.

[193] 189; 1. ú'yank. In this term the prefix u- gives the shape in which the tobacco was given away.

189; 2. Refers to somebody going to the Dalles or other place along the Columbia River. Cf. page 98, *Note*.

[192] [193] 189; 3. In this verse there are four particles pointing either to distance or to elevation (altitude): tú'sh, hu, the -u suffixed to nen (nen hu) and to tchílamna. This song is sung by a woman, who hears (nen) for the first time of this assembling of geese; shésho waíwash stands for shéshash waíwash, or shéshatko waíwash: birds called waíwash-geese.

189; 5. A young woman is the object of this song-line.

[237] 189; 6. Woodpecker-scalps of shining colors are still in use for ornamenting various articles of dress, implements, &c. u'hlutuína: he flaunts it and parades in it.

[192] [193] 189; 7. Ká tal? who then? who after all? abbreviated from kaní tala. Dresses made of walyátchka-skins passed for the poorest and meanest of all garments.

[291] 190; 9. This is sung by men only.

190; 13. A satire on feminine voracity. Sung by Klamath women from Klamath Marsh. Cf. below, 190; 21.

190; 12. haktchámpash; -pash is the suffix ptchi phonetically altered, the word introducing a comparison of the "striding one" with the young klítishcrane in the same song. A sarcasm on a long-legged person with swinging gait.

190; 16. Regularly worded, this proverb-like verse would read as follows: Kí'-ntchish gú'lu wú'n-dákiash shanámnakía.

000 II. Satiric songs obtained in the Modoc dialect from Toby Riddle and J. C. D. Riddle.

190; 18. A tatler has received the deserved bodily punishment for his gossip-tales. Of the first word no grammatic analysis could be obtained in either tribe.

190; 19. The business of gathering edible roots devolves exclusively on women, but here an old man, Bin, who still lives among the Modoc at Yáneks, is indulging in this useful pastime. That 's where the point of the satire lies. Hú'rpash is a word unknown to the Klamath Lake people in the signification of "basket".

190; 20. Sung by the national deity when foiled in the attempt of killing five lynxes by throwing stones at them; repeated from the shashapkéleash, page 126, 3. Cf. *Note*.

190; 21. To be found in another version among the Klamath Lake songs; there it refers to a female living on Klamath Marsh, not on Klamath Lake.

190; 22. This tune was with many similar ones improvised by the Modocs, who visited the East a short time after the Modoc war, on seeing crowds of blacks filling the streets. All Indians feel *at first* a peculiar very strong aversion against the Ethiopian race, though subsequently they often become friends and intermarry.

MISCELLANEOUS SONGS.

OBTAINED IN THE KLAMATH LAKE AND MODOC DIALECTS.

1. K̲ó-i ak a nä′pka Yámatkni gatpam′nóka
⏑⏑–́|⏑–́⏑|–́⏑⏑|–⏑–́|⏑
Disastrous times we had when the Northern Indians arrived.

2. Nä′nu wíka-shítko múkash hä′ma –́⏑⏑⏑|–́⏑⏑⏑⏑|–́⏑
I hear the owl's cry and very near it seems to be.

3. Mbû′shant käíla hämō′la, –́⏑|–́⏑|–́⏑⏑
shitchákta nä′ts käíla, ⏑–́⏑|–́⏑
shiukuapkúka nä′ts kä′la. ⏑⏑–́|⏑⏑–́|⏑
In the morning the Earth resounded,
Incensed at us was the Earth,
For to kill us wanted the Earth.

4. Wákaptch nen hí′tksh Ê-ukshi nē′pka,
nû′ kam hí′tksh telû′lit.
To see how Klamath Marsh appears from there,
I wish to look down on it from that height.

5. K̲ú-idshi nû kí′pash nû lulína
Dressed in poor garments I stray around.

6. Tutíχash nû lulína ⏑–́|⏑–́|⏑–́|⏑
I am going astray while dreaming.

7. Kapkáblandaks! ō′kst a tkaléga ndéwa ⏑–́|⏑⏑–́|⏑⏑–́|⏑–́⏑
Be silent! her body arises from the dead to scream!

8. Mû′ni nû lak̲í gí, k̲á-i kánam shlókish; –́⏑|–́⏑|–́⏑‖–́⏑|–́⏑|–́⏑
k̲ó-idsha ne-ulχóga käíla tilangédsha. –́⏑⏑|–́⏑|–́⏑‖–́⏑|–́⏑|–́⏑
I am a potent chief, nobody controls me;
The mischief-doing world I upset.

9. "Käíla nû shuļēmokē′dsha", –́⏑⏑|–́⏑⏑|–́⏑
kē′nta käílatat tgí′kōlan shuína. ⏑⏑–́|⏑⏑–́|⏑⏑–́|⏑
"I take the Earth up in my arms and with it whirl around in a dance";
On this soil I am standing and singing [the above words].

*539
533
171

10. Aíshish kaí nû sha-ûlō'la, ⊥⏑|⊥⏑–⏑|⊥⏑
yuhanéash kaí nû sha-ûlō'la. ⏑⏑|⊥⏑|⊥⏑⏑⏑|⊥⏑

I Aíshish I shall brandish, I shall brandish my huge sword.

11. Aíshishash hûn gáldshui, ⊥⏑⏑|⏑⊥⏑
hû' mish hû' shnekshituápka. ⊥⏑⏑|⏑⏑⏑⊥|⏑

Go to meet Aíshish; he will save you.

12. Tídsh hûn liuleḵán tchiálash shakatchóāla!

Halloo! let us form a circle and screen the salmon against sun-heat!

13. Kilidshí'ga-shépolamna ⊥⏑⏑⏑|⊥⏑⏑⏑

They carry long-necked ducks on their backs.

14. Kaukátsi Yaína wō'n a shû-û'dshant i! ⊥⏑⏑|⊥⏑|⊥⏑|⊥⏑|⊥⏑

Follow up the elk and chase him upon Kaukátsi Mountain!

NOTES.

The first eight songs are worded in the Klamath Lake dialect, the third is of a mythic character. Songs 7–12 are worded in Modoc; 8 and 9 are K'mukámtchiksh songs. A few songs or fragments of such, which would come nearest to what we call nursery or Mother Goose's songs, will be found in the Myth of the Bear and the Antelope: 120, 11. 12. 13. 121, 9. 17. 122, 12. 13.

192; 1. This song is sung by women only, and seems to point to an ancient invasion of the country by tribes from the North or from Columbia River.

825
821
192

192; 2. The owl's cry is of fatal augury.

192; 3. Girls' song. When at sunrise a haze or fog extends over the country, this is supposed to be a sign of the Earth's wrath against men.

192; 5. kí'pash is no word at all, but seems to stand for gitko-ptchi.

192; 7. The Indians were reticent about the meaning of this song, and hence I presumed that ŏ'k was intended to mean some deceased person, since these are spoken of as hû'k, *he, she*. Then the sense would be: "Be silent! that dead squaw is arising to sing a loud song." One Indian informed me that ŏ'ksta meant a squaw, and pronounced it ŏ'kaht (húnkisht?). Cf. *Note* to 35, 8 and page 180, second *Note*.

192
193

192; 8. These trochaic verses are called the K'mukámtchiksh-song, and a variant, tuálam, exists for kánam. The alliteration of the k's and n's is very conspicuous. The meaning was given as follows: "I the omnipotent and unseen ruler of the universe will chastise and turn it over for the manifold crimes committed in it by Indians and men of other races."

192; 9. This is another K'múkamtch-song, in which he menaces to destroy the world for its misdoings. I have put the first line in quotation marks, because it forms the words or text of the song. The first line is sung about a dozen times before the second is sung once.

193; 10. Christian song, referring to the day of last judgment. Aíshish, who is a deity representing the powers of nature with animal attributes, has been in the mind of some Modocs identified with Jesus.

*539
533
171

193; 11. Song of Christian origin, in which Aíshish is also identified with Jesus for no other reason than a fancied similarity of names.

193; 12. When of a party of fishing girls one catches a salmon or other large fish, all the others quit their lines, arrive on the spot, roast the fish while singing these words and eat it up.

193; 13. This song is common to Modocs and Klamath Lakes and is descriptive of children amusing themselves with ducks. Pretty melody.

NOTES.

000 194; 1–8. These whoops and tunes were sung by Modoc warriors when on the war-path, or after their return in remembrance of their exploits. The whoops were chanted and howled while going round in a circle for one to two hours; even now they are heard on solemn occasions. This uniform performance was, however, interrupted sometimes by feigned attacks on a supposed hostile force lying in ambush or marching past. A scalp-dance tune, beginning with nḳeíha, is added, also battle cries.

194; 2. The kā' kā' kā' refrain serves as an incidental interruption of the wéaha- and other whoops. They pronounce it almost voicelessly by tapping their hands upon the blown-up mouth or cheeks in a quick measure.

194; 3. The nóḳe nóḳe is sung either as an introduction to the howienā'-whoop; or as a conclusion to it. It is pronounced in a similar manner as the kā' kā', and often accentuated nokē'.

194; 7. This scalp-dance tune is one of the many heard at these dances during the earlier Modoc wars. A peeled tree, sometimes twenty feet high, was planted into the ground, otter and rabbit skins fastened on or near the top, and below them the scalps of the enemies killed in battle. Forming a wide ring around this pole (wálash) the tribe danced, stood or sat on the ground, looking sometimes at solitary dancers, moving and yelling (yä'ka) around the pole, or at others, who tried to shake it, or at fleet horses introduced to run inside of the ring. Circular dances are of course performed by joining hands.

194; 8. These are the war-whoops alluded to in 23, 15. Cf. ā-oho-ú'tchna in Dictionary.

*539 533 194; 9 etc. I include under the heading "humming tunes" lively tunes of short, ever returning periods of words whose signification is generally obliterated. Some of them may include archaic words and forms no longer understood by the present

*539
533
generation, while others contain words of the language actually in use but ground down or defaced in such a manner as to make them unintelligible. The variations in which these songs are sung are infinite in number, since they are fancifully produced at the will of the singer. I thought it sufficient to give a few of these variations only, and took care to mark the higher pitch of the voice, a sort of musical arsis, by the accentuation. The majority of them form an accompaniment to the motions made while gambling.

[115] 194; 9–17 were obtained from a young Indian, Frank, living on the Williamson River. Cf. page 91, second *Note*.

194; 16. kalena tenā is rendered by: "ye are all dead at once"; which means: all of you have lost in the game.

[171] 194; 18–195; 4. Playing tunes sung by Modoc and Klamath Lake Indians when sitting at a spélshna or other game, also while musing, travelling or working; given by Jeff. C. D. Riddle. The person who deals the sticks in the spélshna-game is the one who sings the tune.

[171] 194; 18 and 19. 20 and 21. 22. Melodious tunes sung by Modocs and recently introduced among these Indians.

195; 2. 3. These are among the most frequent tunes hummed while playing the spélshna-game. Like 3 and 4, 1 and 2 are often sung alternately.

195; 3. 4. These words are made up from the terms by which butterflies are called: walwilégash, yapalpuléash.

A. These dance-tunes, 195; 5–9, are in use among the Klamath Lake people and were obtained from Minnie Froben. The first of them sounds almost like 194; 4. 5. Little bells are often rung while dances are performed and dance-tunes are sung. Women and girls of the Modoc tribe end their songs with a protracted i-ū, while the men habitually conclude them with a loud u-ŏ'hu.

B and D. Obtained from Dave Hill; sung among the Klamath Lake people.

C. Given by Long John's Ben. They begin with the sound h-, like the majority of the Shasti tunes.

E. All obtained from Jeff. C. D. Riddle.

196; 1. Repeated indefinitely, as soon as [illegible] assumes a *quicker* measure. Compare with it the song of the skunk 162; 7, [illegible] of the quiver, 163; 8, and *Notes*.

196; 3. stáni, *full*, seems to allude to the formation of a ring for dancing. Cf. stá hashámpka 23, 12. and what is said of 196; 7.

196; 4. 5. The last group in this tune, hoyó winnā'-ā', serves sometimes as a refrain, sometimes as a stop.

196; 7. Of foreign introduction, as shown by the sound r. Sung in alternation with stán, stán 196; 3 and said to come from Warm Spring Indians. 196; 2 sounds very much like: "how do you do, sir?"

196; 8. Probably contains the words: k'leká a hū, "he, she is dead"; kēlayá-a serves as a refrain, sometimes as a stop.

196; 9. The day before the funeral of Púkish, mentioned in Doctor John's trial, I heard his aged mother sing this tune. Other mourners in the funeral tent sang what is contained in 196; 8. 10.

196; 10. Funeral tune heard from Snake Indians at Yáneks, on Klamath reservation. They join hands and sing this melancholy tune for hours; the higher the deceased stood in his tribe, the longer lasts the wailing.

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians
177 of southern Oregon, informants revealed an unformalized synthesis of
178 aboriginal and modern Christian religious beliefs. These involve, among
779 other ideas, an identification of the Klamath culture hero with personages in
the Christian pantheon such as the God-Father, Jesus, and Satan. This is of
interest since the contemporary Klamath have lost all formalized aspects of
their older culture. The major institutions of the past have fallen by the way
and, in their overt forms at least, have been replaced by those of the encroach-
ing Anglo-American society. Acculturation is so far along that the observer
182 can elicit only covert survivals of aboriginal ideas. Although the tone of the
folk culture has been lost by the Klamath, the reservation life, a common
economy, and the wardship status enforced by external governmental agencies
combine to effect a haphazard solidarity in the group. It is hence not sur-
prising to discover a rephrasing of older values to meet modern situations.
A case in point is the attempt by many tribal members, young and old, to
find continuity in folklore and so to read Christian meaning into aboriginal
myth.

175 Klamath culture of the past was not essentially different in its orientation
177 from that of many western tribes. Because the tribe was geographically mar-
ginal to several culture areas, it is possible to note the composite nature of its
culture and to discern the realignment and reintegration of elements which
222 it shared with California, the Plateau-Basin, and the Northwest Coast. In
226 its overall configuration, the native culture differed from that of the adjacent
gathering peoples because the Klamath had settled on the lakes and marshes
631 of the region and depended on fish and a wild water-lily. Beyond the basic
621 economic structure, however, one may note the California flavor of the separa-
771 tistic hamlets with their loose social and political organization; the weakly
791 developed (and possibly late) wealth complex, suggestive of the Northwest
and the Oregon coast; and the formalized shamanistic religion which points
to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

101 [1] This paper is based on data collected during two summer field sessions, 1948 and 1949,
122 on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund,
1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by
research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

Archaeology and Ethnology, 30, Berkeley, 1930), 224-325; Verne F. Ray, *Cultural Relations
in the Plateau of Northwestern America* (F. W. Hodge Anniversary Volume, III, Los Angeles,

771 To treat aboriginal Klamath religion under three headings of shamanism, 791 power quest, and cosmology is patent oversimplification. In nature and 551 content these features formed an integrated configuration reflecting a major cultural preoccupation. It is true that the shaman in each community played a dominant role and in his capacity as curer, magician, and entertainer com- 787 manded the utmost in social prestige. On the other hand, as was common in western North America, every individual, at puberty and thereafter, deliberately and repeatedly sought contact with a variably defined spirit world. Thus Klamath culture had a variation of the American Indian guardian- 773 spirit theme. Less specifically formalized, and so perhaps, less well integrated, 776 were the elements of myth and tale, the rationalizations for the presence of various natural phenomena, for eschatology, and for the general conception of the universe. Like adjacent tribes, the Klamath interested themselves in animal spirits. These were of particular importance in providing shamanistic power. In the individual power quest, however, the sources from which spiritual forces emanated were less specifically defined. A rather wide range of supernatural powers was recognized, some being animals, some vaguely anthropomorphic, others relating to such natural features as mountains, streams, rocks, or even landmarks like Crater Lake. In respect to these forces an involved folklore has arisen which allows some classification of the Klamath 775 concepts of the supernatural. In this realm, for example, are views about the abode of the dead and the nature of ghosts and souls, these being carefully differentiated from nonhuman spirits.[3] Here too is a body of myth relating to superhuman dwarf men and women, to the forces in specific places or natural phenomena in the Klamath terrain, and finally, the most important for this discussion, to the culture hero, the anthropomorphic Kemu'kemps.[4]

171 Kemu'kemps, while not usually identified with an animal spirit, has many characteristics suggesting the folklore regarding Coyote in the Plateau-Basin. He is at once creator and trickster, angrily forbidding in some contexts, indifferent in others, and in still others a ludicrous buffoon.

825 Essentially human in conceptualization (a myth complex relating to a 821 human hero also occurs in adjacent regions), Kemu'kemps is sometimes identified with the marten, whose younger brother is weasel, and with the winds.[5] In the myths assembled by Gatschet, he constantly rivals his magically born son 'Ayšiš, whose destruction he repeatedly plans, often with the result 821 of encompassing his own. Weather, such as rain or heat, was also attributed to him. Kemu'kemps is also the creator, and there are numerous folktales which tell how he brought various locations into being. At his instigation,

[5] Gatschet, 1890, pt. 1, lxxxii-iii.

773 Crow's laughter turned the human and animal objects of his wrath into stones,[6] 776 the basalt outcropping which are today pointed out around the Klamath [823] Reservation as evidence for the truth of the old tale. To summarize, while the culture hero was not himself a source of power for men, the forces at his command were essentially the same as those which every Klamath sought in a formalized quest. Although concerned with natural phenomena like winds, heat, and rain, Kemu'kemps was on the whole indifferent to the fate of men. Like other anthropomorphic or zoömorphic culture heroes, he became the theme of many tales, a source of amusement and entertainment in the aboriginal Klamath culture. But even though humor was present in the tales concerning him, he appears to have been regarded as real and with a slight tinge of awe. There is no question of his marked importance in the aboriginal culture.

777 To evaluate properly the Klamath culture hero in the modified setting 775 of the contemporary society, attention must be paid to the religious modifications in the group since the inception of culture change through the encroach- [721] ment of Anglo-American settlers. The Klamath were never drawn into hostilities with the Whites, unlike their linguistic relatives, the Modoc. Contacted sporadically by Europeans from 1825 on, the Klamath were ultimately drawn into a treaty with the United States in 1864. This reflected pioneer movements to the west and the growth of White population in Oregon. [791] An enforced culture change began with the treaty.[7] There was as a result [797] proscription of the shaman's ecstatic curing activities and an intensity of Christian missionization. Other introductions included a new technology, White education in reservation boarding schools, a new status in relation to an established administrative agency, and new concepts of property, society, and political tribe.[8] The result was in some instances chaotic rebellion, a resistance which took the form not so much of open revolt but rather of a half-hearted and often uncomprehending shift to new cultural values and [182] patterns. The effects are observable today in the tacit rejection of governmental administration and external Euro-American social goals, and in the disorganization of society and personality on the reservation.

175 Klamath history is well known since the treaty of 1864. Like many western 668 American tribes, the Klamath were ripe for the native messianic movements, the cults which promised a return to the past and implied expulsion of the European oppressor. An example is the Ghost Dance of 1870.[9] Here Christian

---

[825] [6] Gatschet, pt. 1, 131-132. Some informants suggest that the name for Crow or Raven, Ka'ākemps, is the same as Kemu'kemps. This is doubtful, of course. Parenthetically, many modern Klamath insist that there are no snakes in the Williamson River valley because all were turned to stone by Crow's laughter.

[113] [9] Leslie Spier, *The Ghost Dance of 1870 among the Klamath of Oregon* (University of Washington Publications in Anthropology, 2: 2, Seattle, 1927), 39-56.

Here Christian
175 elements, like the sign of the cross, were interspersed with native Klamath
668 traits relating to the shamanistic seance and to the aboriginal folklore. The
177 acculturation process also involved modification and integration of Ghost
[578] Dance forms introduced from adjacent tribes.[10] The growth of tribal, rather
than hamlet, factions split the reservation at this time, and there was the
pattern, familiar among other Indians, of chief rivalling shaman and of progressive against conservative. While the 1870 cult is one abortive attempt
at native cultural revival, the post-contact history of the Klamath is replete
with illustrations of a religiously conceived resistance to the disrupting
pressures from without. Variously listed are the Earthlodge Cult, the Dream
Dance, and several other revivalistic and messianic forms.[11]

175 By about 1900, nativistic movements on the Klamath Reservation had
177 burned themselves out. Tribal life of a half century ago was fraught with
[668] essentially the same problems which dog it today. People entered into economic
competition in the greater society and became nominally Christian (and so
[797] lent Methodist sanctions to social institutions). However, the older values
[791] were only with difficulty accommodated to the new. One or two shamanistic
practitioners survived but others felt that their power was gone. One infor-
[533] mant tells of her uncle, a shaman, saying sadly, "My songs (shaman power)
have left me." Shamanism as an integrating factor in Klamath life and in
that of other Pacific Northwest groups is reflected in another important
771 movement, somewhat different from the frenzied Ghost Dance. This is the
175 Shaker Cult, also a synthesis of native and Christian elements but with
177 longer range objectives. Originating in the north in the 1880's, it diffused
slowly, reaching the Klamath in 1914.[12] Basically Christian in its orienta-
795 tion, the Shaker Cult admits a fundamentalistic Protestant eschatology;
but in its emphasis on a "God is Light" theme, the employment of the cross
as a particularly efficacious holy symbol, the use of bells, and the presence
of curing seances, it assumed a peculiar flavor. Numerous aboriginal elements
[755] also are discernible.[13] Techniques reminiscent of shamanistic curing are employed (for example, the removing of causes of disease from the sufferer's
body by means suggestive of shamanistic legerdemain), although the Shakers
vigorously disclaim the older shamans, describe their work as of the devil,
178 and insist that the spirit of God effects Shaker cures. But the Shaker Cult,
771 too, although it enjoyed a following on the Klamath Reservation for some
795 years, is dying. A few older people now meet in each other's homes for services.
The Shaker church at Chiloquin, Oregon, is now rarely used, and the younger

---

[10] Spier, 1927, p. 45. The Ghost Dance was evidently introduced from the Northern Paiute. The Klamath held that Kemu'kemps was coming from the south and that the dead were to return. See p. 53.

[113] [11] Nash, 1937, pp. 412-435; cf. Cora DuBois, *The 1870 Ghost Dance* (Anthropological Records, 3: 1, Berkeley, 1939), 130-134.

795

771 reservation residents are not attracted. Like its more dramatic predecessors,
178 the Shaker religion fails as a bulwark against societal disorganization.

[182] The modern Klamath are in the main nominally Christian. Many are
allied with local churches: Protestant groups attract a fair following; some
771 are Roman Catholics; others now and again join the itinerant Pentecostal
795 and Holiness groups. While many Klamath are unquestionably religious in
184 the accepted Christian sense, the church offers a primary social outlet to
[797] those who value group association. Whatever the function of the church on
the reservation today, apparently it has no aboriginal vestiges in its ritual
[571] or organization. It would be impossible to say to what extent tribal members
find a link with the native past in the spiritual curing practices of such bodies
as the Pentecostal Assemblies of God, which, however, clearly make no concessions
to aboriginal concepts.

771 It thus seems evident that the overt forms of tribal religion are gone. The
177 Klamath majority is now avowedly Christian even though church affiliation
is not universal. Religious attitudes seem highly diverse. Some individuals,
184 while indifferent to religious tenet, are admittedly attracted by the display
or by social opportunities. Some are devout, others ignore the churches entirely.
Still others, whether or not church members, speculate on religious
questions, show considerable introspective preoccupation, or are frankly
curious about native religion and Christianity. Their opinions and attitudes
[755] demonstrate that the aboriginal past is not wholly dead. In this consideration,
[757] shamanistic curing may be ruled out, since modern medicine is generally
accepted by the Klamath and, in any case, shamanistic patterns have merged
with the decaying Shaker Cult. Since this is so, the less formalized aspects
of the aboriginal religion survive to intrude now and again into modern conceptualization.

183 The survival of cosmological features may still be observed here and there.
[773] For example, tales of people and animals turned to stone by Crow's laughter
are half-credulously recounted by young and old. A surviving custom or two,
183 reflecting the older world-view, might also be noted. A boy who kills his first
224 deer is well advised not to eat its meat himself. By giving the game away,
he averts failure in his next hunting expedition. Hunting on the reservation
today is a sport, no economic value being attached to it. (Aboriginally too,
the Klamath were so well adapted to their specialized lake-marsh economy
that hunting played a distinctly minor part.) This custom, which may stem
from the emphasis on wealth and generosity, is laughed down today but it is
825 still practised. Another very common belief is that animals can speak Klamath
[191] but not English. A howling coyote is recognized by young and old as a harbinger
[763] of death; the owl says, "'Maklaks, 'maklaks," which "when you hear
it, it means somebody close to you is going to die." The Klamath word means
183 human and refers to the tribe itself. Taboos on the first game of the hunter,
the first wild foods gathered, as well as fear of the owl are widely distributed
among western tribes.

178 But more pertinent here are the modern Klamath views based on the past
which either influence actual behavior or bridge a gap, conceptually, specu-

178 latively, or rationally, between past and present. There is good evidence
that the need for the power quest has not entirely disappeared, while on
the mythological side, notions concerning the culture hero Kemu'kemps often
recur.

787 The aboriginal power quest was highly formalized. Every Klamath, ap-
881 parently regardless of sex, sought power frequently. While puberty was
usually a starting point for these contacts with the supernatural, the power
785 obtained could be lost and might be sought again. A series of related concepts
existed: a sense of humility, fasting, a lonesome vigil, purification by sweating,
533 and other elements encountered among many Indian tribes. The Klamath
emphasized the inspirational song as evidence of the contact, and the word
/*šuw'i·s*/ meant spirit song, spirit power, or the spirit itself, depending on
787 context.[14] With the breakdown of the older culture, missionary activity from
177 without and the consequent imposition of new values, the formalized behavior
792 associated with the power quest fell away. But because it was highly in-
dividualized and unquestionably was an integrative factor in personality,
it was not wholly abandoned. Probably the nativistic movements, the Shakers,
the Pentecostalists, or the other emotional outlets permitted substitutions.
One cannot gauge how widely persistent is a sense of individual rapport with
the unseen world; certainly it is not discussed at the present time. The
examples cited here are essentially unintentional expressions of older in-
formants. Undoubtedly, these statements are an index to the emotions as-
sociated with the institutionalized aboriginal quest.

A paralytic woman, bedridden, aged about eighty, remarked as follows to me,
782 "Every day I pray to the mountain. I lie here in my bed and I am sick and
776 old and every morning I say to those mountains, I say, 'Bless me, help me.'
823 I pray just like my mother taught me to do. I ask the river to help me. I
774 say, 'River, help me; give me strength.' And I look over to that rock over
787 there and I get help. My mother taught me to pray to rocks and mountains
and to give some food to them before we eat. It's just like in the Bible. I
dream of those mountains at night. They kind of help you when you ask it."
She also recounts a visit to Crater Lake: "When I was young, I went up to
Crater Lake with a woman I knew. She tied my eyes and led my horse, up,
up. Then she said, 'Untie your eyes,' and I nearly fell off the horse. I saw a man
standing on the water far away, just like in the Bible. He scared me so. I
773 don't know who that was, but I like to think of that man now." The in-
formant refers here to the common Klamath myth of water beings, visions of
whom were apparently a significant part of the spirit quest.

Another older male informant gives a similar view of natural phenomena:
"When I was young, I used to hear my grandfather and father talking. They
said to me, 'You rustle around and get power; you pray to the rocks.' I never
did, but once I was sick and I tried it. 'Help me, I am sick,' I said. Oh, it
was good; they kind of made me feel good, them mountains did. Now I'm a
797 real Christian [a converted Shaker] and I pray to God and Christ. Those
things help you, but maybe it's the Devil that's working against God."

---

[14] Spier, 1930, pp. 94-100.

782 Other informants also give a hint of this attitude. Even where there is
776 sophistication by virtue of education or long-time residence away from the
group, one encounters statements like that of a woman, half-Klamath, half-
823 Caucasian: "Those old Indians had a lot of sense. They kind of felt at home
774 around here and they would get a lift just from talking to the mountains
787 and lakes. It was like praying and it made them feel at peace. When I get
up in the morning, I look first over there [at Mt. Pitt] and it makes me feel
good too. Not that I pray in the old Indian way; that's just idolatry. But
it's like the scenery kind of gets ahold of you even if I been seeing it all my
787 life."

776 A possible indication of this attitude appears in the repeated warnings to
855 children to avoid certain rocks and cliffs. "You might fall down and hurt
yourself" is of course quite true; on the other hand, places about which some
823 modern Klamath parents feel particularly uneasy were associated aboriginally
with power sources. A strong drive in the past was fear that a child might be
784 harmed through contact with "power." Every effort was made to keep the
child away from the shaman, the sweat lodge, the mourning place, and the
841 like. (It may be noted that menstrual blood was placed near the cradled
child to negate forces whose mere presence could harm the inexperienced.)
These attitudes toward nature and the surrounding natural phenomena, at
least as sources of uneasiness, still exist among younger Klamath of today.

773 Also obtainable is evidence on attitudes toward the culture hero. Some
776 offer a rational systematization of beliefs concerning him. Generally, this
177 involves some interpretation in the light of Christian reasoning. Kemu'kemps,
because of his essentially human characteristics, readily lends himself to
identification with the Christian God. The middle-aged woman quoted above,
struck by the linguistic parallels, notes: "Those old Indians were really
273 Christians. It's only the liquor around here that makes the unbelief and
trouble. Kemu'kemps means the 'Old One'; that's God. He revealed himself
to the Indians long before the Americans [sic] came. He had a son, too,
'Ayšiš, that's just like Jesus. He created the world, just like it says in the
Bible. If only those old Indians had been able to see it, they were close to
God all the time. They lived good upright lives under his guidance. Another
word for Kemu'kemps in our language is *Playtul'kni·;* that means the 'One
on High,' 'Somebody up there.' That's the name we give God in our language
now. It's all the same."

Not all informants are so definite in their syncretism. One elderly woman remarked: "Who is Kemu'kemps? I don't know. Sometimes I think he's God, but sometimes I think he must be Devil. Maybe he was just a story the old Indians made up. But they called him Playtul·kni· and that means God. My grandson asked me, 'Gramma, who's Kemu'kemps?' I say, 'I don't know. Maybe he's like God.' " In another connection she remarked: "I think that Kemu'kemps is Devil. He gets people into trouble; he leads them into temptation. When I was a little girl, they said to me, 'He's no good; don't believe that any more.' But I don't know. I see the icicles and I think of the wind and Kemu'kemps. He made the world and they call him Playtul'kni·. The Devil

773 is Mu·natul'kni· ("The One Below"). They say Kemu'kemps is everywhere
776 and that's like God. I think about that sometimes."

177 Undoubtedly, a confusion arises because of the adoption by missionaries,
[797] years ago, of terms for the Christian God which the Klamath had applied to the culture hero. The overlapping of Christian and native concepts is readily seen and provides a basis for debate and doubt.[16] It may be profitable to note some of the views and to determine how variable present attitudes are. There is scarcely any standardization except a very prevalent view that Kemu'kemps is somehow real.

The statements which follow were made by Klamath in response to the general question: What is Kemu'kemps? One man, aged about seventy-four, remarked to Hiroto Zakoji, University of Oregon: "Kemu'kemps disappears when he wants to. He tells what will happen and it happens exactly. He gives power to the Indian doctors [shamans] and sends them their songs. But I heard in stories that Kemu'kemps does bad things; he does tricks. I think he is mean, too. God in the Bible is mean sometimes, too. In the Bible it says that God is a jealous god. That's in the first Genesis [sic] and the Ten Commandments says that, too . . . . Sometimes I think Kemu'kemps is the Devil himself. There is a place near the dam over near Chiloquin on this side of the river. There is a big rock sticking out over there near a cave. Kemu'kemps tricks people to go there and dance when a girl reaches the age [puberty]. He misleads people. But God sometimes does bad things; he made Adam and Eve, but he also made the apple."

Two older male informants told separately versions of a myth about Kemu'kemps as a trickster. In the tale, the culture hero set what appeared to be venison up on poles. When the people present asked for some, he at once welcomed them to a feast. To their horror, they found that they were eating Kemu'kemps' feces. The hero laughed and disappeared. The remarks of a man, aged sixty-two, are of interest: "Can you imagine him doing a thing like that? I think that's just a disgusting old Indian story. God wouldn't do a thing like that, so Kemu'kemps must be Devil. But God made plagues in Egypt and maybe that's what this was like."

Although some informants conclude that the culture hero is an older revelation of the Christian God, others, as may be seen, are equally convinced that he is allied with or is the Christian Satan. But the ambivalent attitude appears to be most characteristic. H. Zakoji, of the University of Oregon, reports the following statement from a 74-year-old male informant: "I don't know what he is, God or Devil or what he is. According to the Bible, we worship one God. Nobody ever saw God and white people say that. That's what gets me. Kemu'kemps dealt with the Indians only. He must be before Christ came and he must have disappeared when Christ came." In another connection, he said to me: "If Kemu'kemps disappeared when Christ came, then Christ conquered him. They say when Christ died, he conquered sin and the Devil.

---

[113] [16] These statements suggest the views of Father Wilhelm Schmidt and their implications as given in his *High Gods of North America* (Oxford, 1933), especially chap. 8.

773 That's why Kemu'kemps disappeared when Christ came. But then I remember
776 them talking when I was young about how Kemu'kemps was coming back.
777 That was all lies so I guess Kemu'kemps must be the Devil. Still, they say he created all just like God. I don't know how to figure it."

Mention was made above that the culture hero had a son who was born miraculously. The possible relationship between 'Ayšiš and Jesus has caught the fancy of some. A man of seventy comments: "Yes, Kemu'kemps and God are one and the same. There's a story that says how Kemu'kemps saved a woman's baby when she jumped into the fire and that baby was raised as his own son. I don't believe it. God created all living things. He made the Devil, too. I think 'Ayšiš is the Devil because he's always trying to get the best of his father. We old Indians knew about God but we didn't know about our Lord and Saviour, Jesus Christ."

A 56-year-old woman remarked: "Yes, Kemu'kemps is God and he had a son, just like Jesus. 'Ayšiš even dies and comes alive again in the old Indian stories, and that's like the Christians teach. And that Holy Ghost business, that's the power that God gives. The Indians knew about that. That's why you say 'Father, Son, and Holy Ghost.' "

But so concise a syncretism of aboriginal and Christian religious elements
[184] is rare. Younger people vary greatly in belief. One man, about thirty-eight, noted: "Kemu'kemps? They told us stories about him when we were kids. They said he's like God. It doesn't matter to me. Maybe he is; they always say how he made everything around here. Maybe he did; things get that way somehow." A 31-year-old woman remarked: "Kemu'kemps stuff is what they tell kids. That's old Indian devil-talk. I don't know nothing about it." And a 16-year-old girl stated: "I've heard my grandmother talk about Kemu'kemps. That's kind of scary stuff like the dead coming back to haunt
[823] you. There's a cave up on the Sprague River where they say Kemu'kemps used to live. Maybe he still lives there. Anyway, I wouldn't walk up that road in the dark."

A woman of about fifty-five, when questioned about the religious training
[869] she gave the grandchild entrusted to her care, answered: "Children learn about the Bible very fast. I tell my granddaughter the old Bible stories and she likes to hear them. But I steer off of that old Indian stuff. I think we ought to get away from those old Indian superstitions. I'll sure get mad if anybody scares her with stories about those old Indian things like Kemu'kemps."

Her statement sets the tone for the future. The old beliefs are being lost, and although still very general, they stand out most vividly only in the minds of those who were raised in the period of the second Ghost Dance and the analogous revivalistic movements which followed it. While they obtained, during their upbringing, a detailed background of native Klamath mythology, they succeed, according to their own inclinations, in passing on their point of view to their descendants, or they may fail to do so. The attitudes indicated above are individual; no debate about the nature of Kemu'kemps or related
[795] concepts has been noted. While the formally organized religious groups, including the Shakers (however dependent on the aboriginal patterns of

773 shamanism and curing), consistently oppose any such conceptual survival,
776 the point does not emerge as a significant controversy.

Thus, despite the decline of Klamath culture, something of the aboriginal
177 world-view persists. If the unformalized aspects of culture have a greater life-
[795] expectancy than the formalized and institutionalized ones, then the point of view reflected in myth, a series of cultural premises, must in some form outlast the setting of the point of view into motion through actual behavior. This has apparently happened among the Klamath. The overt behavioral aspects are gone entirely, but some individuals uneasily attempt to bridge a gap. The mechanisms which produced a Ghost Dance and a Shaker Cult are now merely vestigial but still present.

FOREWORD

The Survey of California Indian Languages, Department of Linguistics, 114
University of California, Berkeley, was fortunate to have Mr. M. A. R. 12
Barker as one of its field workers during the summers of 1955, 1956, and 1957. He had come to us from the University of Washington where he had had good training under Professors Melville Jacobs and Fang-Kuei Li and, after a year's further training at the University of California, he chose Klamath as his field language. Having located some good informants living in Chiloquin, Oregon, he was able to make an intensive study of the language and to obtain full materials for a grammar, a set of texts, and a dictionary.

Since 1957 Barker has been connected with the Institute of Islamic 114
Studies, McGill University, Montreal, Canada, where he teaches Urdu, Arabic, and general linguistics. In the midst of these many other duties, 128
Barker has found time to write up and send to the Survey a series of Monographs on the Klamath language. The present work, Klamath Texts, was sent to us first, but after the morphemic analysis was complete and the dictionary had been prepared, he sent us a list of corrections which he wished to have inserted in the typescript of the Texts. Working under our direction, Mr. Haruo Aoki, advanced graduate student and research assistant in linguistics, has carefully incorporated the necessary corrections. A few other minor changes have been introduced by the Survey's unofficial editor. For the most part these were dictated by the necessity of presenting the Klamath materials in more than one volume—the typescript of the Dictionary alone is nearly a thousand pages long! The changes are as follows: (1) What was originally an appendix to the Dictionary, namely Klamath Place Names with Map, has been removed from that position and included as an appendix to the present, shorter volume, the Texts. (2) The first paragraph of the Introduction to the Texts has been rewritten to include the names of the Klamath informants for the texts, since these do not otherwise appear except in the Introduction to the Grammar. (3) Bibliographic references are given in full wherever needed, since the Bibliography does not appear in the present volume but is included with the Grammar.

FOREWORD

128 The plates contain prints of black and white negatives produced from Kodachrome slides taken by Barker. It was regrettably not possible to include pictures of all of Barker's informants; some of the slides had too many deep shadows to make satisfactory black and white copies.

INTRODUCTION

114 The texts presented here were collected during the summers of 1955, 1956, and 1957 which were spent among the Klamath Indians at Chiloquin,
122 Oregon. The field work was carried out under the auspices of the Survey of California Indian Languages, Department of Linguistics, University of
115 California, Berkeley. The narrators of the myth texts were Mr. Robert David, Mrs. Pansy Ohles, and Mr. Grover Pompey; the ethnographic materials were obtained from the first two of these and from Mrs. Aggie Butler, Mrs. Grover Pompey, and Miss Irene Skellock.

126 Most of these texts were recorded directly on tape, but some were taken down first in dictated form and were taped later. Of the myths, only Texts 1 and 7 were not recorded on tape. Of the ethnographic materials, Texts 24, 25, 29, 30, 31, and 35 were dictated only.

[124] No really exhaustive attempt was made to obtain a complete collection of Klamath myth texts. Instead, the author aimed at a representative collection of materials, including myths told by several informants, autobiographical experiences, ethnographic texts, historical incidents, conversation, and also the responses to a series of elicitation pictures (Text 39). It was felt that these texts would provide, on the one hand, good illustrative material for further linguistic studies in Klamath, and, on the other hand, a representative sampling of myths and ethnographic material of interest to the folklorist and ethnologist.

114 The collections of Klamath myths so far published are limited to A. S. Gatschet's "The Klamath Indians of Southwestern Oregon (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890) and some brief song and medicine texts in Leslie Spier's "Klamath Ethnography" (University of California Publications in American Archaeology and Ethnology, vol. 30, 1930). More recently, Dr. Theodore Stern of the University of Oregon has collected a large number of Klamath myths. The author understands that Dr. Spier also possesses a collection of myths. It is urgently hoped that both of these will be published in the near future.

128 The present collection is divided into two major parts: Myths, and
773 Ethnographic Texts. The former contains tales about the inhabitants of

128 the prehuman world, when everything spoke and had life (as Mrs. Ohles
773 put it). The primordial human inhabitants of this world (the /paewdiwa·s/)
[796] are only casually mentioned, and the main figures are the mighty culture-transformers Gmoḱamč, čečte·sis, and Sqeĺamč. The last two may be alternate names for the same figure, and the informants translated both
128 freely as "Old Marten" or "Old Mink." These beings travel through the
796 world, meeting monsters and inimical beings and destroying them, teaching the /paewdiwa·s/ how to live, and aiding those in trouble. Texts 19 and 20 contain incidents involving hostile, powerful beings and modern humans. Text 21 seems to involve modern humans also, but may refer to the /paewdiwa·s/.

128 The second part of the Texts contains material on food-gathering, historical occurrences, ethnographic descriptions, autobiographical incidents, etc. Text 38 consists of a free conversation between two informants and the author.

The translation of these texts presented considerable difficulties. To render the Klamath morpheme by morpheme—or even word by word—is, of course, impossible. This necessitated the addition of whole new phrases, at times, in order fully to cover the Klamath meaning. An attempt was made to keep the Klamath phrase junctures (/,/, /./, etc.) intact, although this has sometimes produced sentences which are thoroughly un-English.

Some of the Klamath material has been translated with great freedom. This is particularly true of the series of particles (sentence-connectives, etc.). Such sequences as /čoy/, /čoy honk ʔat/, /čoy čik/, /čoy da·ts/, etc., have been rendered as "So," "And," "Then," "So then," "And then," "So now," etc. The full force of these elements cannot be rendered into English without making the English sentence unintelligible. Forms like /či honk/ (lit. "as it") and /naʔas gi/ (lit. "thus did, thus made") have been freely translated as "(he) said, says," since this is the nearest English parallel of their use in Klamath.

Material in the translations which did not seem entirely justified from the Klamath alone has been inserted into the English enclosed in [. . .].

Parentheses have been employed in the Klamath to enclose English interpolations, asides to the investigator, etc.

Quotation marks have been used with several distinct purposes: (1) to enclose direct speech—material quoted by the speaker as being the speech of another (there is nothing in the phonemics to indicate this, but it is done for clarity's sake); (2) to enclose words quoted from the other language (i.e., words from English used in the Klamath, and words from

128 Klamath in the English sections). "Quoted" here has the technical meaning of "occurring as an integral part of an utterance in Language A, while belonging to the phonological system of Language B." For example, /kant sa nen do· ćosak "Smith River" ʔigsiga./ "Those which they always went to get there on 'Smith River.'" Here "Smith River" followed the English phonological system entirely. Where borrowed words follow the Klamath system, they are quoted in Klamath phonemics but are marked in the translations by quotation marks. Thus, /ʔi·t sa hon gi./ "They 'eat' it."

The symbols '. . .' mark quoted material occurring within quotation marks, as described above.

Place names, proper names, names of unknown plants, etc. have usually been left in Klamath, though without quotation marks. Exceptions to this practice are made whenever the name is easily translatable, or whenever a place is well known to English readers. For example, /ćasga·y/ "Weasel," /ća·sis/ "Skunk," /gi·was/ "Crater Lake."

The transcription is phonemic with the sole exception of juncture. The texts have been rewritten here in "slow speech" (i.e., with all of the morphophonemic junctures occurring as phonemic junctures). This has been done in order to facilitate morphological and syntactic analysis. Thus, /čoysongat/ "so they now" has been written out in its slow speech form: /čoy sa honk ʔat/. Between morphophonemic junctures, however, all material is written phonemically.

PART ONE: MYTHS

1. Old Bear and Antelope

(Mrs. Pansy Ohles)

(1) Black Bear had two children. (2) Antelope had two children. (3) And every day they went to gather ipos. (4) Now Old Bear was very lazy. (5) And Old Bear said, "These fleas are killing me, making me itch. (6) Pick my fleas here!" (7) So she looked for fleas. (8) "There are no fleas. (9) I don't see anything." (10) "Let me pick you over!" (11) Antelope said, "No. My head doesn't itch (me)." (12) "Let me see!" (13) So then Antelope lowered her head. (14) Old Bear put ipos into her mouth. (15) Then Old Bear bit [at Antelope's neck. Mrs. Ohles made a clicking sound with her teeth to indicate Old Bear was crunching up the ipos and pretending to find fleas on Antelope.] (16) "Many, many fleas!" (17) Antelope was terrified, her heart thumping. (18) Then they went home. 539*

(19) Then at evening time, now they had finished eating. (20) Then they lay down. (21) And Old Bear went right to sleep. (22) Then Antelope said, "Don't go to sleep! Don't go to sleep! (23) I will tell you something. (24) She is really planning something. (25) She said I had many, many fleas. (26) Then she bit at me, the neck. (27) So if she does something to me—and perhaps she'll kill me. (28) Don't you do anything! (29) If indeed she returns alone, you'll know she did something to me. (30) Perhaps she'll kill me. (31) So you must escape!"

(32) Again they went to dig roots every day. (33) Then she bit off [Antelope's] head. (34) And she hung up her "lights" in a tree.[1] (35) Then they flickered in the dark. (36) And now Bear returned. (37) Now she just barely got back [because of the weight of Antelope's meat, which she was carrying]. (38) Thus, "We found very, very much. (39) And your Mother stayed there, where the fire burns. (40) Look there!" [She pointed towards Antelope's "lights," which could be seen flickering like a campfire in the distance.]

---

[1] [ǰila·'s] : /ǰila·ʔas/ "lights, internal organs of an animal" is treated as a round object in Klamath: [lʸaʔa·yi̲'s] : /laʔa·ya/ "puts a round object up high." They flicker because they belong to a myth-being. [196]

(41) čoy sa dedalčn̓a. (42) čoy gemgem hak gyank.

(43) čoy honk ʔat wil̓e·m p̓as sʔotl̓a. (44) "p̓algyat, p̓algyat!" (45) čoy k̓ičk̓a·ni honk naʔas, "k̓isi·bam ʔeči·s siik m̓a·sʔa." (46) čoy mo·ni na·k ktiwčn̓a, naʔas, "JiJi·ks!" (47) čoy honk ʔat saʔi·syank čle̓lga. (48) gilʔank p̓awo·k, q̓ay saleʔa wil̓e·m̓am̓č. (49) čoy honk sas dom p̓as se·w̓a.

(52) čoy mbo·sant sas na·nok sʔeqga. (53) sʔeqgank sas, naʔas gi, "goni· do· le·wči·k!" (54) čoy ʔat sdoli· mna wewe·k̓a, "q̓a···y ʔa dwa· le·wwapk pač̓it, čoy ʔaMk̓a ma·l̓s sa waq giwapk. (55) q̓ay ʔa·t sangal̓i·gye·wapk! (56) q̓ay ʔa·t wdo·damkangwapk! (57) q̓ay ʔa·t soyn̓iwapk! (58) q̓ay ʔa·t soho·wwalye·gwapk! (59) q̓ay ʔa·t dwa· le·wwapk!" (60) čoy honk y̓aMtgi Na·s.

(61) čoy wiwʔa·l̓a·k naʔas gi, "hak na·t le·w̓a dwa·! (62) dwa· hay na·t le·wwapk! (63) so·damyagye·ʔa?" (64) "q̓ay!" (65) "ʔi hay dwa· ʔelgi!" (66) "q̓ay ʔa na·t san̓a·Wawli le·w̓as." (67) "hak na·t sangal̓i·gye·ʔa!" (68) "q̓ay." (69) "hak hay na·t soyn̓in̓a!" (70) "q̓ay." (71) "hak hay na·t sosanʔaqn̓a!" (72) "q̓ay." (73) "hak hay na·t leplep p̓ol̓e·n̓a!" (74) "ʔi·, ʔi·, ʔi···!"

(75) čoy sa honk ʔat lobi· wl̓awl̓ačk̓ya na·nok, hon wqepl̓aqs. (76) čoy sa honk ʔat sla·yaqs sda· gi. (77) čoy ʔat naʔas, "na·t ʔa lobi· giwapk." (78) čoy sa naʔas giwapk, "leplep p̓ol̓e··, leplep p̓ol̓e··! p̓ol̓e··! p̓ol̓e··!" (79) čoy honk ʔat sliwk̓yo·la, dinqs. (80) "ʔa·tčgas!" (81) čoy sa dilhi. (82) "leplep p̓ol̓e··, leplep p̓ol̓e··, p̓ol̓e··, p̓ol̓e··!"

(41) So they looked. (42) And they just kept quiet.

(43) Now then Bear prepared food. (44) "Come and eat! Come and eat!" 539*
(45) Then the little one [of Antelope's children] said, "It tastes like Mommy's milk."[2] (46) Then the biggest one nudged him, saying, "Careful!" (47) Then he secretly put it aside. (48) Because she ate quickly, Old Bear did not see. (49) And she thought they ate a lot.

(50) The biggest one did not sleep all night. (51) When the little one cried, he said, "Don't! Don't! Maybe she'll kill us next."

(52) Thus, the next day she said goodbye to them all. (53) Having said goodbye to them, she said [to Antelope's children], "Go over there and play!" (54) Then she advised her own little children, "Don't play anything now, or perhaps they will do something to you. (55) Don't play leap-frog![3] (56) Don't swim around! (57) Don't race! (58) Don't play jump! (59) Don't play anything!" (60) But she forgot one.

(61) So the little fawns said, "Let's play something![4] (62) Let's play something! (63) Swim-racing?" (64) "No!" [said the little bears]. (65) "You name something then!" (66) "We don't want to play." (67) "Let us play leap-frong!" (68) "No." (69) "Let us race!" (70) "No." (71) "Let us wrestle!" (72) "No." (73) "Then let us play 'Two-in-smother'!"[5] (74) "Yes, yes, yes!"

(75) Then they first closed up everything, of that house. (76) Then they filled it up with smoke. (77) Then they said, "We'll do it first." (78) And they will do thus, "Two-in-smother, two-in-smother! Smother! Smother!" (79) Now they opened the door; they ran out. (80) "You next!" (81) So they ran inside. (82) "Two-in-smother, two-in-smother, smother, smother!"

---

[2] /ḱisi·bam ʔeči·s sitk m̓a·s'ʔa/ "It tastes like Mommy's milk" is baby-talk. Normal Klamath would be: /ṕkisam ʔečas sitk m̓a·s'ʔa/. The baby Antelope is here shown retaining the affix which occurs with kinship terms in their nominative form: /ṕkisap/ "mother." [195] [193]

[3] ‖ s̲ngalygie·'wabg‖ : /sangali·gye·wapk/ "will jump over one another for sport." ((s̲g) 2pv "reflexive-reciprocal"; (ngaĺ) 45-v "to jump"; (oygi) 10sv "over, above"; (e·') 13sv "in sport, play, competition"; (wabg) 23sv "future"). This word has a closely similar meaning to ‖ s̲ho·d̲wlye·gwabg‖ : /soho·wwalye·gwapk/ "will jump over each other," but this latter item seems to refer to jumping contests. [192] [196]

[4] /wiwʔa·la·k/ "little fawns" is irregular. ‖r̲e̲wile'a·k‖ should : */wiwleʔa·k/. (wile) "fawn" must be stated as having an allomorph ‖wiʔa·l‖ only with (r̲e̲) and followed by ('a·k). Otherwise ‖wile‖ occurs. [193]

[5] This was Mrs. Ohles' own idea for a translation of /leplep ṗole·/: "Two-in-smother." /leplep/ seems to be a distortion of (la·b) "two" plus (r̲ér̲). (ṗoĺ) 78v "to be out of breath, smother" occurs as a regular verb, but not with any affix /e·/, unless this be an otherwise non-occurring allomorph of (e·') 13sv "to do in sport, competition." [193]

(129) čoy naʔas, "ʔaMḱa ʔi honks sgiso·lat." (130) čoy honk ʔat noĺo·ĺle·gi ʔankẃa·k, wage·nha čačga·lam. (131) čoy honk naʔas, "ča! ʔat! ʔi lobi· hoygič́a!

(83) And they let them out. (84) Again they went back inside. (85) "Two-in-smother, two-in-smother, smother, smother!" (86) And then, "Two-in-smother, smother, smother, smother-r-r-r . . . !" (87) "So smother there!" [Antelope's children said.] (88) And now, "Smother-r-r-r . . ."[6]

(89) Now they said, "Now they have died. (90) What shall we do now?" (91) So he said, "Having caused them to embrace each other, having stood them up in the doorway, having propped open their eyes and mouth. (92) And they'll look like they're laughing, when the Mother comes home. (93) And she won't suspect anything." (94) And they then advised everything, "Do not tell where we have gone." (95) But they just forgot Awl.

(96) Then they went down into the hearth. (97) They just shut [the way behind them with] a coal. (98) Then they went and went, ran and ran. (99) They did not stop anywhere, [but] ran and ran.

(100) Now Old Bear came back. (101) She said, "What are you grinning at so much? (102) I just barely got home . . ." (103) And she said, "Ohhhh! They have played a trick on me!" (104) She called and called, "Where are you? Whe-e-ere are yo-u-u?" (105) And thus, "Answer me! Answer me!" (106) Nobody said anything. (107) Then she said, "Where did they go? Where did they go? (108) Do you know? Do you know?" (109) Nobody said anything. (110) Nobody paid attention. (111) Then she said to Awl, "Do you know?" (112) "How stupid this one is! (113) You started it. (114) What are you so sick about?" (115) "Where did they go? (116) Only you can tell me. (117) If you won't tell me, then I'll break you in two." (118) "Ohhh, they went down right there."

(119) So she just barely squeezed in her hind-end. (120) Then she went, tracking them. (121) Now the little one got tired. (122) Then the bigger one said, "We'll crawl into the log right here" [pointing to a hollow log].

(123) Then she overtook them there. (124) "Yes," she said, "Tomorrow I'll play with you with daytime eyes."[7] (125) Then Old Bear went to sleep.

(126) Then the biggest one awoke. (127) And he said, "Ohhh, now this one has caught up with us!" (128) Then he said to the little one, "Do-o-on't you cry!" (129) And he said, "Perhaps you'll wake her up." (130) Then he threw a little piece of wood over her, perhaps a pine cone [to see if she were sound asleep]. (131) Then he said, "Hah! Now! You jump over her first!

---

[6] Sentences 86 and 88 become progressively more falsetto toward the end, drawing out to a voiceless [R·] for dramatic purposes. Sentence 87 is shouted with much vehemence. [194] [196]

[7] /peepea loigbaiga/ "with daytime eyes" is also distorted speech for dramatic effect. No form *[rrepee] : /peepea/ exists in normal speech; (pee) "daytime" does not otherwise occur with any of the (re) morphemes in the corpus. [196]

---

[192] */lololololok!/ indicates the rumbling noise of thunder. The intonation contour of this sequence drops rapidly from an initial high pitch down to a very deep bass.

539*

(132) And I'll come following you." (133) Then they left Old Bear sleeping right there.

(134) Then they went on again, again they went. (135) Then Old Crane was fishing early in the morning. (136) Then they ran down to the shore. (137) And they said, "Granduncle! Get us across! (138) Old Bear is coming, chasing us!" (139) Then because he was a relative, he [Old Crane] put a leg across for them. (140) And they ran across. (141) Then he blew them into an olderberry flute. (142) And because they were thus afraid, their hearts pounded.

(143) Now Old Bear arrived. (144) "Have you seen [some] children? (145) Did they come this way?" (146) "I don't know. (147) I just now came down to the shore." (148) "Don't lie! (149) Here is their track. (150) This is where your big old foot tracked right here. (151) Stick a leg across for me!" (152) Thus, glaring, "Aaaah!"

(153) He stuck a leg across and she, having gone halfway, drank water [using her basket as a cup]. (154) Then she shook her basket hat [by slapping it against his leg]. (155) "Oh-ho-ho-ho!" (156) He spilled Old Bear into the water, and she sank. (157) Then Old Bear died.

2. Coyote and Badger

(Mrs. Pansy Ohlea)

(1) Badger was throwing his eyes very far [up in the air]. (2) And they [made a noise] thus, "lolololok!" (3) Then they fell back into [his eye-sockets]. (4) "Ohhh, I do this well," he said. (5) And so again, "lolololok!" (6) Then Coyote came near, came near. (7) "What are you doing?" (8) "I'm throwing my eyes up." (9) "Is it they that thunder thus?" (10) "Yes. It's just like thunder." (11) "Yes. Indeed, could I do like that too?" (12) "Yes. Just throw your eyes up!" (13) And, "lolololok," and they fell back in. (14) Then again he said, "Ohhh, this is very good, this thing of yours!" (15) Then he threw them up again. (16) And again, "lolololok," they fell back in. (17) Then he said, "Ohhh, you taught this to me very well." (18) And he said, "Yes." (19) Then he threw them up again, far, he threw them up. (20) And he did it well. (21) Then he threw them up very, very far, and they [sounded] thus, "lolololok!" and they fell back in.

---

[9] Coyote makes "eyes" out of the bright red berries of this plant to fill his empty sockets.

[196] [10] /memye·k/ was translated by Mrs. Chloe as "the little things you see when you've got your eyes tightly closed—like little worms or germs or spots." This may be [remeye·g] "dist. move up, rise." ((re) 1pv "dist. action"; (me) 48-v "to carry, pack, move"; (oye·g) 11sv "up, rising"). Since this analysis is not certain, this item will be separately listed in the Lexicon.

539*

(22) "Yes," he said, "I'll do it again, just once more!" (23) "Thus, I'll do it again, then I'll quit." (24) So he then threw them very, very far up. (25) And, "lolololololok!" (26) Then again he threw them up, very, very far. (27) And a crow speared them [with his beak] as he went along.

(28) Then little Badger, running, went home. (29) "Why should he get angry at me?" he said, "Was that trick something of mine?"

(30) Thus he [the crow?] blinded Coyote. (31) Now he kept falling down [stumbling on things]. (32) He stumbled against everything. (33) And he said, "ʔamma·! On what have I hit my head?" (34) "You've fallen over me, a tree." (35) Again, "Yes. I didn't [mean to do it] to you." (36) And he went and went. (37) And he said, "ʔamma·! I've [stumbled] over you, something!" (38) "On me, a sagebrush." it said. (39) He went and went again. (40) He didn't want them to know that he was blind. (41) As he went, he bumped his head on something. (42) And he said, "ʔamma·! I've [stumbled] over you, something?" (43) And it said, "On me, a wild rose bush." (44) Then, having eaten the wild rose [berries], he went on -- (45) first he made eyes [from the bright red berries of this bush, dropping them into his empty eye-sockets].

(46) Then, having done thus, he looked up, red. (47) "Ohhh," he said, "I wonder if I can fool someone with these?" (48) And he said, "I will stand here. (49) And I will keep looking toward the sky. (50) And I will keep looking up. (51) And perhaps somebody will see me."

(52) Then Antelope—did they say Antelope? (53) I don't know—somebody came. (54) And he said, "What are you looking up at?" (55) "I'm watching these flying spots." (56) "Yes," he said. (57) "Don't you see them, the spots? (58) Many, many little spots, swarming around." (59) And he said, "No." (60) Then, "Why do you look red [in the eyes]—what kind of eyes have you?" (61) And he said, "Could I trade you something [for those red eyes]? (62) Maybe I, too, can see the flying spots."

(63) "Yes," he said. (64) Then little Coyote gave his eyes to—to what? —to Antelope?—perhaps. (65) Then he went off. (66) Then he [the Antelope] said, "I don't see a-a-anything at all!" (67) So stay there full of earth!" [untranslatable pejorative idiom] (68) "Why should they tease me because [my eyes] look red?" (69) That's as far as I recall right now.

[19]

[11] /le ča·nink dwantga doLi·s woli·na/ and /le ča·nink dwantga· lag̣i· neaga/ are mythic utterances and are only partially translatable in terms of the present corpus. /le ča·nink/, translated by Mrs. Ohles as "I wish . . .," may be the negative particle {le} and some form of {ča·ṅ} "to not know how to do." /dwantga/ "with what?, with something" is clear. /doLi·s/ may be analysed as ‖dᵛoLys‖. {dᵛ} 45-v "to act upon a single erect object, stick up"; {oLy} 10sv "into, inside"; {s} 24sv "noun ending"; "erect object sticking up in." /woli·na/ contains {w} 45-v "to act with a long object" and {oli·na} 10sv "off the side, edge." Mrs. Ohles stated that this item seemed to mean "whittle," but she was not certain. The remaining forms (/yoho·/, /lag̣i·/, and /neaga/) are clear. Both utterances are "sung" in a high, faint, far-away tone, trailing away at the end into voicelessness. They are delivered in an even, rhythmical metre, stressed vowels being abnormally lengthened: /le čá·nink dwántga doLí·s wolí·ná/ and /le čá·nink dwántga yohó· lag̣i· néagá/.

3. Little Porcupine and Coyote

(Mrs. Pansy Ohles)

539*

(1) Now I will start. (2) They say that little Porcupine once could not cross a river. (3) And he went crying and crying along the bank. (4) Then a buck buffalo walked down to the bank. (5) He said, "What's the matter with you? (7) What are you crying so much for?" (7) And he said, "I'm crying because I can't get across. (8) I want to get on the other side, to see a sick person—my relative."

(9) Then he said, "Crawl up on here, on [my] back!" (10) "Aaah, no," he said, "You would spill me off into the water." (11) "Not at all! Sit up here between my horns!" (12) Then he said, "No, you'd spill me off into the water." (13) And he said, "Catch hold of [my] tail, and I'll drag you across!" (14) And he said, "No, I'd get wet." (15) Then he said, "Ohhh, grab hold here, on [my] neck!" (16) "No. Shaking [your head] you'd throw me into the water." (17) "Ohhh, crawl up into [my] behind." (18) "Yes, yes, yes, yes! (19) Only thus can I go across." (20) So he crawled inside, behind.

(21) Then he waded across, that elk—rather, that buffalo. (22) And he said, "I don't feel well." (23) And he ate all of his liver. (24) And [his] kidneys. (25) He ate it all. (26) Then as he barely got to the other side, he swallowed his heart. (27) Then he fell down. (28) Then, crawling back out, he said, "How should I have done [?] ? (29) Shaking [his head] he would have thrown me off into the water right away. (30) And so hungry, we [Porcupine and his family] are so hungry. (31) We are very, very hungry. (32) It was for this that I wanted to kill this one. (33) Even though he did carry me across here."

(34) Then he said, while going to and fro along the bank he said, "I wish I had something to make a knife-handle with! (35) I wish I had something to skin this buck buffalo with!" (36) As he said thus, that little Coyote

#539 naʔas gi. ẃaḱa honk domna. "ya···, dwa· nen haḱa! (37) dwa· nen gi?" (38) "le ča·nink dwantga doLi·s woli·na!" (39) "ʔa···, q́ay dič gi," či honk. (40) "le ća·nink dwantga yoho· lagi· neaga!" ---

[196] [13] Coyote's utterances in this section are given in a fierce stage whisper, contrasting with little Porcupine's high and faint repetitions of /le ća·nink/, etc. These whispered utterances are those within quotation marks in sentences 36, 37, 38, 41, 44, 47, and 50.

heard [him]. "Ohhh. Whatever is that? (37) What's doing that?" (38) "I wish I had something to make a knife-handle with!" (39) "Aaah, that's no good," he said. (40) "I wish I had something to skin this buck-buffalo with!" (41) "Ohhh, that's good!" he said. (42) Then he ran up and sat down again. (43) Then he said, "I wish I had something to make a knife-handle with!" (44) "Aaaah, but that's no good!" he said. (45) And he just sat. (46) Then again he said, that little Porcupine, "I wish I had something to skin this buck buffalo with!" (47) "But that is good!" he said. (48) And he again ran a little closer." (49) "I wish I had something to make a knife-handle with!" (50) "Aaaah, but that's no good," he said, and he sat without moving.

(51) Now then that little Coyote came near. (52) And he said, "How are you?" (53) And said, "What's that [you're doing], old fellow?" (54) "Nothing at all." (55) "I misunderstood you to say 'skin a buck buffalo'." (56) "Yes, he's lying over there." (57) "This is my knife. (58) Skin [it] with this!" (59) "No, you will want to take it away from me." (60) "But I won't take it away from you. (61) I'll help you at it." (62) So he said, "Yes."

(63) Then, when they had skinned it all, he said, "I wonder if you'd give me a piece of this?" (64) "No," he said, "I can't give you [any]. (65) You never do good to me. (66) Always you make it bad for me." (67) Then he said, "But I won't make it bad for you, if you could give me [some]. (68) My children are many, and my wife, and we are hungry. (69) And shall I jump with you [i.e., compete at jumping] for this?" (70) "No. You can beat me." (71) Then he said, "Shall we race? (72) Then we'll see whose this will be." (73) "No," he said, "You can beat me in this also."

(74) Then he beat little Porcupine. (75) He beat and beat and beat, and he lay on the ground, little Porcupine, like one dead. (76) Then he left his hat behind. (77) "If this one should move, then call me, and I'll return and beat him." (78) Now then Coyote went off to bring back his children. (79) He went and went and went, and then little Porcupine moved.

(80) Then the hat, sitting by the fire, said, "He's moving! He's mo-o-ving!" (81) Then he returned and beat, beat, beat, and beat [little Porcupine]. (82) Again he lay prostrate, like one dead. (83) And again he [Coyote] ran off to bring them back. (84) Then little Porcupine moved again.

---

[196]

[13] No difference could be discerned by the informant between /ćoye·s/ and /ba·ĺa·ʔasam/. The former is the common word for "hat," while the latter occurs only in this myth. The informant was not sure whether /ba·ĺa·ʔasam/ had any semantic or formal connexion with /ba·ĺa·ʔas/ "flour."

[194]
[196]

[14] All of the quoted material in sentence 101 is in falsetto, indicating the voices of the coyote children eagerly coming to feast. Each syllable is heavily stressed and rhythmically delivered: /ʔát ná·t ṗáwápk!/, etc.

(85) Now that hat, lying by the fire—that hat [see footnote no. 13] said, "He's moving! He's mo-o-ving!" (86) Then, having returned again, he beat and struck, beat and struck [him]. (87) Then again he left him dead —thinking him dead. (88) And little Porcupine played possum. (89) And he thought thus, "What can I do?" (90) And thus, "I'll lie longer this time." (91) So then he lay and lay. (92) That little Coyote had been gone a long time. (93) Now then he moved. (94) Now then that hat called and called and called, "This one's moving! This one's mo-o-o-oving!" (95) Then little Porcupine poked him into the fire [with a sharp object], that hat. (96) Then he lay on the edge, all curled up in the fire.

(97) Then he took it all up into a tree, that meat. (98) Having cut it all up, all—only the backbone he did not break. (99) With the head left on the end, he took it up; very, very high—on what sort of tree I don't know. (100) However, it was a big tree indeed.

(101) Now then little Coyote came back, "Ohhh, now we'll eat! Now we'll eat! Yakyakyakyakyak! Now we'll eat! Now we'll eat!" (102) Then he tracked around the fire. (103) Then he saw that hat thus, sitting in the fire. (104) Then he said, "What should I do? (105) Where has he gone? Ohhh!" (106) Then, being hungry, they yapped all around, those little Coyotes.

(107) Then he said, "Where are you? (108) Where are you?" (109) Then he looked up in the tree. (110) "Ohhh, did you take it way up there? (111) Could you give me [some]? (112) We're very poor! (113) We are hungry! (114) Give [some] to me!" (115) "No. Not to you." (116) "Just give me one shoulder even!" (117) "No." (118) "Give me a piece of rib!" (119) "No." (120) "Please give me a haunch!" (121) "No." (122) "We are very, very hungry. (123) "Even just give me a bone from the back!" (124) "Yes, yes," he said, "You all stand in a line!" (125) Thus, "You all will stand in a line thus, and I'll throw this [backbone down]!" (126) Indeed, with their mouths open to catch it, they were looking up. (127) Now then he threw it down. (128) And he killed them all. (129) Just the one youngest one, the littlest, he escaped. (130) [Porcupine] didn't kill him, [but] killed some. (131) This having happened in that way, now coyotes have become very many. (132) Because they didn't all die, just that one remaining, now they have become numerous again. (133) Yes. That's as far as [it goes] now.

Introductory Note to Text 4

124 After giving the foregoing three texts, Mrs. Ohles was strongly hesitant about giving more. She felt that she had forgotten too many of the details which make the text "correct" to a good Klamath storyteller. She pointed out that she could neither recall the names nor the kinship relationships of the lesser characters, and she felt that she was omitting incidents and garbling the action.

At last, however, Mrs. Ohles kindly agreed to relate all she could remember of the story about the red-haired woman of Sprague River. She had previously narrated this in English to the author, up to the point where Gmoḱam̓č enters the story. She began the myth with the [126] author recording it in his notebook only (she felt the tape recorder might confuse her), but after she had gained confidence, the remainder of the myth was tape-recorded. When she reached the end of her previous English narration, she continued with incidents leading into the Gmoḱam̓č myth—much to the surprise of the author, who had not seen versions of the Gmoḱam̓č story beginning in this fashion anywhere else. The stimulus for this may have been provided by Gatschet's recorded texts,[15] which the author had shown her some days previously. At that time she had recalled these myth incidents easily as part of the corpus of material she had heard in her childhood and since forgotten. With this as a crutch to memory, she produced the text given here. She felt that her version was more generally correct and that Gatschet's texts were only short incidents taken from a long cycle of connected [538] incidents. This cycle, she said, might take three or four days in the telling by a really proficient storyteller. The action and final conclusion of her version she felt to be correct, but she was sure that many minor incidents and characters had been omitted.

This text differs from her previous ones in that it is more conversational and less formal in style. She comments in English and Klamath on her story, makes side remarks to the author and jovially berates him for getting her to tell a story she only partially remembers, and breaks into English at difficult points to supplement half-remembered "hard words." Mrs. Ohles' style in this text is valuable as a sample of less formal Klamath discourse. She contrasts strongly

here with her previous impersonal narrations and with the even less 124 personal text styles of other informants, whose stories and ethnographic material were always given as objective verbal "essays."

---

[15] Gatschet, "The Klamath Indians of Southwestern Oregon" (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890), pp. 98-132, 142-143. The present author read some of Gatschet's texts to Mrs. Ohles, and she was able to recall other incidents and versions.

Some time after the text was recorded and analysed, the author [126] felt the need of having the entire myth on tape, rather than half in notebook form and half on tape. Mrs. Ohles kindly agreed to begin the story over again and told it right up to the point where she had switched to the tape-recorder before. This second tape-recorded beginning is appended to the text and serves for a comparison between pen and notebook dictation and tape-recorded discourse.

Mrs. Ohles felt that material irrelevant to the story should be stricken, since it made the story "incorrect." The author feels, however, that such side remarks illustrate Klamath conversational style and give insight into her attitudes toward the myths and towards other facets of semi-acculturated Klamath culture. This material is, [128] therefore, reproduced within parentheses both in the Klamath text and in the translation. Her English remarks are conventionally spelled but otherwise unchanged.

[585]

---

[16] Mrs. Ohles remarked that in the old days a newly married woman might make frequent and extended trips to her parents' home. Sometimes her husband would accompany her and sometimes not, as is the case in this myth.

C

4. Section 1: The Red-Haired Woman of Sprague River

(Mrs. Pansy Ohles)

539*

(1) Once, they say, there lived a woman, having many children. (2) One only [was] a girl, red-headed, having long hair, red-headed. (3) Then, having grown big, having come of age, she got married—to whom I don't know, from somewhere. (4) Maybe from ÇoWasdi. (5) However, she kept coming back home. (6) She was in love with one of her brothers. (7) Then she said, "Now I'll go back, towards home [i.e., her husband's home]." (8) Then her mother said, "He'll take you home, one brother." (9) She said, "No. He will take me home. (10) I won't return home unless he will take me." (11) So at last he said, "Yes. I'll take you home." (12) Then they came along, came along. (13) And there it got dark on them. (14) And they lay down, having built a big fire. (15) He laid down a bed for his sister on one side of the fire, and for himself on the other. (16) Then they went to sleep. (17) While [he] slept, she crawled in with her brother. (18) Then she put an arm under his head. (19) Then he woke up and said, "What a fool she is! (20) I guessed she'd do this! (21) Whatever will she do to me, being a wife to her own brother!" (22) Now he slowly crawled out [crawled up = got up], and then he found a big [tree-] limb, as big as he was. (23) Now she was sleeping, that red-headed one. (24) Then he pillowed [her head on it]. (25) Then while she slept, he returned home.

(26) Then to his mother he told how she had [done] to him there. [The book has—mistakenly?—"done to me"]. (27) Then the mother said, "Ohhh, now something very bad will come upon us!"

(28) Now she awoke here [i.e., where she was], when the sun was long up. (29) She said, "Now I will make them see something! (She started a fire which leaped ahead of her.) (30) Then she burned up everything. (31) She burned everything down; brothers, and their wives too. (32) Then in the burnt-out fire the girl was searching around, [to see] whether anyone had escaped. (33) Then she said, to her mother, "Because I love you, I will save you." (34) Then the old lady said, "Go and live in the water for a long time!" (35) Now then the mother was going around in the ashes [lit. "extinguished fire"]. (36) She was looking for something; I don't know what she was looking for. (37) And so she turned over a mortar. (38) And there was Meadowlark with a burned-through back. (39) And she [the mother] said, "hãhã?!" (40) And she picked [her] up, and found two children there.

---

[196] [17] This means literally "And [she] caused to stick together, on the back." It seems to imply "back to back."

[201] [124] [18] Literally, "And now, having done this way, it came back down." At this point Mrs. Ohles gestured to show how the boy's arrow fell; i.e., straight down, point first between the little boy and his sister, cutting the pitch which held them together. /geḿas gyank/ "having done this way" refers to Mrs. Ohles' gesture.

(41) She had buried her [pregnant] stomach, that Meadowlark. (42) Then the old lady said, "What shall I do with these?" (43) Then she said, "Yes. I will raise this boy. (44) But the girl will be just like her, like her aunt. (45) And I am very, very much afraid."

(46) Now she didn't know what to do. [translation?] (47) Then she said, "I'll melt a lot of pitch." (48) Then she stuck them together, on his back. (49) "Now he has two heads." (50) Then she advised the little boy, "Don't walk along with your head down! (51) Don't look at your shadow! (52) Never shoot your arrow up [in the air], because something bad will happen to you."

(53) Then having become big, he began to suspect. (54) "Why does Grandmother not want me to shoot my arrow up [in the air]?" (55) Then Killdeer heard, sitting up in a tree, and said, "Shoot it up, and you will see!" (56) Then he shot it up. (57) And the arrow went very high.

(At this point Mrs. Ohles changed from dictation to the tape recorder. She begins with the last two utterances above.)

(58) Then he shot up. (59) And that arrow climbed very, very high. (60) Then it came back down again thus. (61) Then it came straight down the middle [on] the head—thus [came down and split them in two]. (62) Then the little girl jumped down right here [i.e., beside the boy]. (63) Then the little boy said, "Where are you from? (64) Who are you?" (65) Then she said, the sister, "I am your sister." (That little girl started talking then—I don't know why she never talked before.) (66) "Was it for that," he said, "our grandmother didn't want me to shoot [my] arrow up [in the air]." "Yes!" (67) Now then they went home.

(68) Then the old lady said, "Now you know why I was advising you." (I don't know—I think that's the word for it though—kept advising you, telling you all the time not to do this and that.)

(69) Now then that little girl always went with [him], went hunting. (70) Then she said, "Why is [it thus for] us? Without a father, without a mother?" (71) She said, "Why does our grandmother always cry? (72) Why do we live this way? (73) Now the sun is about to rise over there. (74) We will go there and we will shoot the sun, if he will not tell us. (75) Only he knows, the sun, what is happening."

(76) Then he said, "Yes." (77) Now then they went. (78) Now they sat and waited over there. (79) Now the sun was about to rise, now it rose.

*539 (80) čoy honk naʔas gi. "sʔabi· ʔis na·ĺs, sʔabas! (81) dwa· ʔa na·t waq giwk, q̇elẏak ptisap, q̇elẏak ṕkisap?" (82) čoy honk q̇ay sas geqča. (83) "he· ʔi na·ĺs q̇ay sʔabi·wapk, sliwapk mis ni!" She knew that little girl would cut off her mother's head when she came out of water at night, and she was afraid she'd find it in there with the fish.

---

[201]
{124}
[19] The little girl shot the sun in the cheek. Mrs. Ohles gestured to her own cheek here to clarify this, and /ho·t gida gwena, dalčiʔam/ "it made a mark right here, of the arrow" refers to her gesture. She later remarked that the black spot is still to be seen on the sun's "cheek" and suggested it might be an Indian explanation of sunspots.

[192]
[124]
[20] The utterance /gočgočgočgoji·p/ was given in a loud whisper. It is apparently a mythic utterance, a distortion of /pgoji·p/ "aunt, father's sister." The action here was later clarified by Mrs. Ohles. Each time the two children went torch-fishing, their Aunt would appear from the water, leaning into the boat and crying "/gočgočgočgoji·p!/." The children remained perfectly still, hoping that she would eventually lean far enough into the boat for them to seize her and cut off her head. Their Grandmother, sitting at home, heard her daughter each time and knew the children would kill her. Hence her repeated sob, "/hãhãʔ!/." (The symbol "ã" denotes a nasalized low central vowel. The utterance is anomalous to the phonemic system.)

{194}
{193}

(80) Then [she] said, "Tell us, sun! (81) What's [the matter with] us, without a father, without a mother?"- (82) But he paid them no attention. (83) "If you will not tell us, I will shoot you!" (84) But he paid no attention. (85) Now then that little girl shot with her arrow, [the sun's] cheek, that which is black on the sun—it left a trace right here, of the arrow. (86) Then he said, "Ohhh, pull it out of me quickly! (87) I'll tell you!" (88) Then he told them thus, "She lives there, who orphaned you." (Is that right? snoq́o·Ye·gaʔ q́o·Ye·ks is "orphan," you know.) (89) "She lives in the water, who orphaned you. (90) Because of that [you are] orphans." (Phillip, you're the cruellest animal I ever did know for making me tell this!)

(91) Then they returned. (92) But that little girl was planning, thus, "Yes. Now it is winter." (93) Thus, "And we will go torch-hunting, every night." (94) "And so after how many nights (—I don't know—five? —Maybe.) (95) "After five nights have passed, I will cut off her head." (96) Then they planned thus. (97) "Now we'll torch-hunt."

(98) Then they went. (99) Then many, many fish, waterfowl, they kept carrying back and forth [i.e., from the lake to their house]. (100) And they ran back inside. (101) And they said, "It's very, very full, unload it there!" to their grandmother. (102) Then she unloaded, unloaded, unloaded, saying "hãhãʔ! hãhãʔ!" (103) And then, however, they went on another night. (104) (—Oh, I forgot!) (105) When they were torch-hunting, they heard, "gočgočgočgoǰi·p!" (106) And the grandmother too heard [it]. (107) She sat at the door, of the house. (108) And she said, "hãhãʔ! That's her!" (109) And she said, "But they didn't do anything." (But she'd be scared, all the time, you know. She knew that little girl would cut off her mother's head when she came out of the water at night, and she was afraid she'd find it in there with the fish.)

---

[538]

[21] Mrs. Chiloe thought the occurrence was repeated five times. Each night the Aunt leaned farther and farther into the boat. In the older myth style, each occurrence would be repeated by the story-teller. Compare Mr. Grover Pompey's myth about the five geese (Text 8).

[22] Mrs. Chiloe was quite aware of the repetition of incidents in various myths. The same occurrence (fleeing characters warning all the household items not to tell where they were going and somehow forgetting to warn Awl) is found in Text 1, 94-118, in an expanded form.

(110) Now it happened that way many times. (111) (I can't remember very well.) (112) Then she said, "Tomorrow we'll [do it] thus, tomorrow. (113) Maybe she'll pull [herself] up further out [of water] now." (I think that's what that girl said: "I think maybe she'll raise herself further out of water tonight.") (114) And then they went. (115) And she said to them, "g̣očg̣očg̣ocg̣oǰi·p!" (116) And she almost overturned them there. (117) And the little old lady there—their grandmother—said, "Ohhh, it's her!"

(118) Then they [went] for the last time. (119) That little girl said, "We won't go torch-hunting again. (120) Now ours [is] enough, everything." (121) And he said, "Yes." (122) But the old lady was very, very frightened. (123) And she sat outside, even though it was very cold. (124) Then it was thus: again they got many, many fish, waterfowl, everything. (125) And she said, "g̣očg̣očg̣oǰi·p! g̣očg̣očg̣o[illegible]·p!" (126) Then she pulled [herself] out [of the water] very, very far. (127) Then that little girl grabbed her and cut off her head! (128) Having grabbed her hair. (129) Then she buried it there under the fish, under the waterfowl, her head. (130) And she said, "Now we will return." (131) Then they returned.

(132) And the little old lady met them and said, "Did you get a lot? (133) Did you kill a lot?" (134) "Ye-e-es. We killed a lot." (135) Then they said, "We are very, very cold. (136) It is very cold right now." (137) And they ran back inside [the house].

(138) Then she found it there, the little old lady, the head of her daughter. (139) And then she said, "I guessed this—that they would do this to you. (140) But [you] never minded. (141) You never listened to me." (She's talking to the dead now: there's just the head of her daughter.)

(142) Now then, however, those children having gone back inside, they got ready. (143) "We will not remain here, and we will go. Somewhere." (I don't know where they were going.) (144) And then, however, they went down into the hearth ashes. (145) And they shut [it behind them with] a coal. (146) They advised everybody first, "Don't tell where we've gone." (147) But they forgot Awl (—they always forget Awl, all [myths]—). (148) Then they went. (149) Then the old lady asked everybody where they'd gone.

---

[196] [33] The meaning of this utterance is not clear from the context. The Grandmother seems to say, "How very well [he] guessed me!" This seems to imply that the boy wished her to become a bear, find him and his sister, and kill them. This development is reasonable if one postulates that the boy felt so guilty about his incestuous relationship that he wished to die—or at least hoped that his Grandmother would catch up and kill his evil sister.

(150) Nobody answered. (151) And then, finally, Awi told. (152) "Why, didn't they go down right there; they shut [it behind them with] a coal. (153) And then they went." (154) Then she followed them. (155) But those children went very, very far (how many days, I don't know—). (156) But they went for a long time.

(157) Now then that little boy shot his arrow up into a tree. (158) Then he cried and cried; he was unable to get it back down. (159) And he said, "Get it back down for me!" to his sister. (160) "Get this down for me!" (161) "No. How am I your relative [i.e., "How am I related to you?"]?" (162) "You are my sister." (163) "No." (164) "Aunt?" (165) "No." (166) "How is it—mother?" (167) "No." (168) Then he named every relation. (169) But that little girl said, "No." (170) Then, being tired, the little brother said, "Then you're my wife!" (171) "Yes!" she said, and she quickly got it back down for him. (172) That little girl was very strong. (173) Then they went; now they lived together, being related as brother and sister.

(174) Then their grandmother followed them. (175) And she said, "hâhî'! I knew this! (176) They would do this way. (177) She is evil, just like her whom she has just killed." (178) Then they went and went. (179) And then [the little girl] got pregnant. (180) And [the grandmother] saw [the impression of her pregnant stomach] where their sleeping-place was.

(181) Then he killed a bear, that man, because now he had become a man (i.e., come of age, since he now had a mate). (182) And the grandmother said, "How well he has guessed me [i.e., guessed my intention, guessed what I wanted to be]!" (183) Then he hung it up and left it, having skinned it, (—on what [he hung it] I don't know—on a tree or a log—). (184) He hung it up on something, the fur. (185) Then he went on. (186) Then they got to somewhere, there. (187) And there he began to go on a power quest, now being a man. (188) And she [the grandmother] followed, followed. (189) And she said, "Having guessed [my intention] so well, has he left this for me?" (190) Then she crawled into it, into the fur. (191) Then she became a bear. (192) And she said, "Now I'll do something to them!" (193) Then she went on.

(194) Then somewhere the next day that man said, "If my comb falls down, [I] having put it up high—if my comb falls down, then you'll know she

#539 waq nis gist. (195) ʔaMḱa hok gida lobi· gatbanwapk, wage·nha no·s hok lobi· gaẃalwapk. (196) q̇ay da·ts ʔi woswapk!" (197) ʔat sam we·ḱa gitk. (198) we·saltk sa ʔat. (199) čoy honk ʔat spodo·ča. (200) čoy honk hok sńewe·ts do···m ʔankẃala, do···m.

---

[196] [24] Utterances 202 and 203 are given in a high, faint voice, indicating the Grandmother's age and fatigue.

[25] The remarks in parentheses here are addressed to the author, who was holding
[126] the microphone too close to Mrs. Ohles' face. It is interesting to note that she spon-
[124] taneously treats the microphone as a "round object" (e.g., ‖iˇcíǵi!‖ "Put down a round
[196] object!"). The author, as an outsider to the Klamath world-view, might have been tempted to treat it as a long object or even as a rope-like object.

did something to me. (195) Maybe she will come here first; perhaps she will find me first. (196) Don't you be afraid, however!" (197) Now they had a child. (198) They had a child now. (199) Then he went off on a power quest. (200) Then that girl gathered wood, a lot of wood.

(201) Then later she arrived, their grandmother. (202) "Ohhh, I'm very tired. (203) Now I've arrived. (205) You're living very well here, having made it nice, everything." (206) "Yes." (207) Then she said, "Where is he?" (208) And she said, "He is on a power quest there." (209) And she said, "Yes, I'll go and see him." (210) "Yes." (211) "And perhaps I'll return very hungry." (212) "Yes."

(213) Then she went off. (214) Then she chased [him] wherever he had power-quested, the mountain, on the plain. (215) And then, because he was very tired, he fell down into a gopher's [?] hole. (216) Then she ate [him], that grandmother, she being a bear.

(217) Then she returned, there towards home. (218) The comb fell down. (219) Then [the little girl] filled a water container with water, "She'll return very thirsty." (220) Then that girl, she was thus, carrying her baby on her back. (221) Then, however, she heated many, many rocks, having put them in the fire.

(222) Then she came, the old bear. (223) She said, "Ohhh, I am thirsty." (224) And she [the little girl] said, "There is water over there. (225) Cool water." (226) And she said, "Ohhh, you've [done] this for me nicely!" (227) Then she drank and drank. (228) Then she [the little girl] threw the stones [which she had heated red-hot] into her anus! (Now this is as far as I'm going to tell now. I'm tired now.) [Here Mrs. Ohles took a short rest and then began again.]

(229) Now then that old bear said, (What's the matter with you? What're you doing? Put it down! Put it down! You scare me, sticking it in my face here. Now you made me forget what to say. Stop it!)"

(230) So then she drank and drank. (231) Then having drunk she said, "Ohhh, here it twists me, [my] stomach. (232) I have drunk too much water." (233) Then she said, "Step on me here! (234) Step on me here!"

("Step on me here!" Of course, that's what this maiden wanted to do was step on her, so that those rocks would cook her.) (235) čoy honk ʔat gisl̓ga (or gisWa—or something. I can't distinguish either one of them.) (236) čoy honk glega hok ʔat loq.

4. Section 2: Gmoḱaḿč́ and ʔaysis
(Mrs. Pansy Ohles)

(237) čoy honk ʔat ʔanko mo··· so·ča, honkantga ʔankotga. (238) ʔat siʔo·lagyo·la, ʔanko. (239) čoy honk ʔat ḿolẃa, mbatĺa·ĺwapgok. (240) mbatĺa·ĺwapk ʔat, histańḱitk. (241) čoy honk ʔanko sʔotĺa, gmoḱaḿč́, čalamnank (above their camp. And he was making wood up there.) (242) čoy honk naʔas gi, "ya···, dič́i· ḿoḱa·k!" ("The baby's nice!") (243) čoy honk naʔas gi, "q́ay ʔan ho·t mbatĺa·ĺo·twapk, ḿoḱa·k." (I can't think of that mallet he used yet![36]) (244) čoy da·ts honk ndoga peč, ḿoḱa·ks, mbatĺa·ĺsi. He wanted to take it back and make-believe that he had a baby. So he put it on his forehead—) (250) gida honk hakeli·ga, laḱi·yyat. (251) čoy honk naʔas, "ya···, ge· dak q́oy." (252) čoy honk do·s hak be·n heksalga—gida, ʔaMḱa gida—ni·sdat, hoksatnank. (253) čoy honk naʔas, "ʔa···, q́ay dak ge· dič." (254) čoy honk naʔas, "ya···, q́olĺnčJat ʔan lotq́agwapk!" ("I'll get a boil on my knee," he said.) (255) čoy honk ʔat q́olĺnčJat mna ksodi·la.

(256) čoy honk ʔat če·t hak gatbambli, siko·tbambli. (257) čoy honk be·p mna naʔas gi, "waq lis ʔi gen?" (258)—hok gmoḱaḿč́ hok ʔat, be·yaltk. (259) čoy honk naʔas gi, "waq lis ʔi gen?" (260) "q́ay ʔan sʔaywakta. (261) ʔaMḱa ʔans ge· dwa· waq gi, č́o·ks. (262) q́a··· ʔans ge· goWa.

---

[124]

[36] Mrs. Ohles later explained that Gmoḱaḿč́ struck the baby from its cradleboard with some kind of cane or mallet, whose name and description she could not recall. The author asked her if she thought it was called /ʔi·me/ (the cane carried by Weasel in Text 7), but she did not think this was so.

("Step on me here!" Of course, that's what this maiden wanted to do was step on her, so that those rocks would cook her.) (235) Then she stepped on her (or stepped down on her—or something. I can't distinguish either one of them.) (236) Then that bear died.

4. Section 3: Gmoḱamč and ʼaysis

(Mrs. Fanny Ohles)

(237) Then [the girl] built a big fire with that wood. (238) Now she finished gathering wood. (239) Then she got ready, to jump into the fire. (240) She would jump in then, having [the baby] on her back. (241) Now then Gmoḱamč was getting wood, sitting up on the mountainside (above their camp. And he was making wood up there.) (242) Then he said, "Ohhh, a beautiful baby!" ("The baby's nice!") (243) Then he said, "I don't wish that she jump into the fire with it, that baby." (I can't think of that mallet he used yet!) (244) However, he struck its foot, the child, as [its mother] was jumping into the fire. (245) And the baby fell far away. (246) It fell down there. (247) Then he picked it up.

(248) Then he said, "Ohhh, what should I do with this one? (249) Where should I—how will I take this one back home?" (He didn't want to take it back in that śwenč [cradleboard]. He wanted to take it back and make-believe that he had a baby. So he put it on his forehead—) (250) He put it here, on [his] forehead. (251) Then he said, "Oh, this is not good." (252) Then he put it down again there—here, perhaps here—on the neck, having put it on. (253) And he said, "Aaah, but this's not good." (254) Then he said, "Oh, I'll make it come up out of [my] knee!" (I'll get a boil on my knee," he said.) (255) Then he put it under his knee.

(256) Then with difficulty he returned home, supported himself on a stick. (257) Then his daughter said, "What's the matter with you?" (258)—That Gmoḱamč had a daughter. (259) Then she said, "What's the matter with you?" (260) "I don't know. (261) Perhaps something has happened to me, [to my] leg. (262) This has swelled up [on] me a great deal.

#539 (263) mo··· nis goWa, čo·ks." (264) čoy honk naʔas gi, "kitʼí ʔis gen!" (265) čoy honk naʔas, "ya···, laq ʔa ge· gi!" (266) kitʼía honk, hok be·p, gmoḱaḿčam be·p. (267) čoy honk naʔas, (—ýaMtgi balaq hak—) "laq̇altk ʔa ge·!" či honk, "ya···, ʔaMḱa ʔi tapýaltk!" (268) čoy honk naʔas, "ʔi·." (269) čoy honk ʔat ḿoḱa·k swaqča, swaqča. ---

[196] [37] The informant here indicated by a gesture that /gida/ "right here" meant "on the ground between his legs."

[196] [38] Little Słoḱwa's exclamation begins voiced and high-pitched and descends to a very low note. It is progressively less voiced and ends voiceless.

[194] [39] This utterance is produced by an ingoing air current rather than an outgoing one. It is otherwise a mid-high back rounded vowel. The symbol [U·] has been arbitrarily chosen to stand for this anomalous phone, which occurs nowhere else in the corpus.

(263) It has swelled up [on] me very, very much, [my] leg." (264) Then he said, "Puncture it for me!" (265) Then she said, "Ohhh, this is hair!" (266) She punctured it, that daughter, Gmoḱaḿč's daughter. (267) Then she said (—I forgot all of a sudden—) "It has hair!" she said, "Ohhh, maybe you have a little one!" (268) Then he said, "Yes." (269) Now then that baby cried and cried. (270) And they gave it every sort of name. (John, Peter, and so forth. They named him every name they could think of.) (271) But he cried, he got worse. (On and on he cried, you know; that's what that goni·ĺḱa means.) (272) Then he said, "ʔaysis. This is ʔaysis." (273) Then he was very quiet. (274) He didn't cry, the baby.

(275) Then he grew very big. (276) Then he had many wives, whoever. (You know who the wives were.) (277) Mudhen, Green Heron, Snowbird, Squirrel, —and one more—Mallard.

(278) Now then that Gmoḱaḿč always sat by the fire. (279) And that little Squirrel was always picking her fleas. (280) And that Gmoḱaḿč said, "Why is it that he loves her much more? (281) He loves her more. (282) He is always with her, not those other women. (283) And Mallard was very—what?—jealous always. (284) "He does not love me. (285) He loves little Squirrel." (286) Then Gmoḱaḿč fell in love with her, little Squirrel. (287) Then he went to gather wood (—what kind of wood I don't know. However, it always popped sparks. Sparks flew out from that wood anyway, and he wanted to burn Sḱoḱwaʔa·k so she'd throw her blanket off of her where she was naked all the time, because she was always picking her old bugs. I've finished telling it to you in Klamath—what's the matter with you? How greedy [you are]!)

(288) Then he put his eyes down here—he put them down here. (289) Then he sat by the fire, Gmoḱaḿč. (290) Then sparks popped out, and burned little Squirrel. (291) Then she said, "ʔututututu!" (292) Then that Gmoḱaḿč said, "ʔU·!" (293) Then he saw something.

(294) Now then he planned to kill ʔaysis. (295) Then for a long time he plotted thus. (296) He always used to walk around over there. (297) Then a reed—was it a reed?—he found a reed there, on the prairie. (298) And on that reed he found Meadowlark's nest. (299) Then, returning, he told ʔaysis

#539 stilta ʔat honk ʔaysisas bla·ywa·sam sńoLas gaẃlok. (300) čoy honk naʔas gi. "čoy da·ts hok bla···y gi. (301) čoy no· geaga hadakt kč́imnis, gmočatk giwk. (302) dam ʔi kčimničat?" ---

[124]
[114]

[20] The author had not completed his reading of Gatschet's myths to Mrs. Chiles at this time, and she supplied the incident of the Butterfly sisters from her own memory, although it is also found in Gatschet's version in almost identical form. Gatschet's myth does not contain the incident of ʔaysis and the Porcupines, however, nor any mention of ʔaysis's new wives.

he had found an eagle's nest. (300) Then he said, "But it's very high. (301) And I can't climb up there, being old. (302) Can you climb it?" (303) And he said, "Yes." (304) Then, however, he said, plotting, "Having taken off all your clothes, you can climb up there." (305) Then ʔaysis climbed it that way. (306) Then it grew and grew, that reed. (307) High (—And could it be the Klamaths' "Jack in the Beanstalk"? Perhaps.) (308) Then very far and high, and it had no limbs—things to crawl down with, things to go down with. (309) Then very, very high, then he found Meadowlark's nest. (310) Then he threw out the little birds, Meadowlark's baby birds. (311) Now it had grown so far, until [it touched] the sky there. (312) Then ʔaysis became very thin.

(313) But that Gmoḱamč, returning, he made little Swuirrel his wife. (And I don't recall it well there. From there I don't remember well what happened. And your myth, which you know—then I'll go on from there now, where you don't know, where it didn't tell.)

(314) Now then the Butterfly sisters were flying around. (315) Whatever were they flying around there for? (316) Then he just barely pulled out a hair and threw it down. (317) Then they said, "Ohhh, what a shiny hair! (318) Where is it from?" (319) Then they went far, far up, those Butterfly sisters. (320) Then they found ʔaysis there. (321) Just bones. (322) Thin. (323) And he was almost dead, from hunger, without water. (324) Then they took him down (with what they took him down I do not know. But you might know. Maybe in your myth, it is there.) (325) Indeed, they took him home, to their place, wherever it was. (Maybe to this country, I don't know.) (326) However, he was gone for a long time, ʔaysis.

(327) Then he lay, always by the hearth, there they laid him and took care of him, they. (328) Then there again his wives were many—the Butterfly sisters, Grasshopper, Ant. (329) And whoever—however many they [were] —five, perhaps ten women were there. (330) Perhaps they were [all] sisters, I don't know.

(331) And then there—who?—Porcupine came and danced every day. (332) And [the Porcupine] made dust all over from the hearth, just dirt. (333) And he said, "What's the matter with you [pl.]? (334) Why do they come and dance [over] me? (335) Who? (336) Porcupine[s]—Porcupine[s] dance [over] me."

---

[196] [31] Mrs. Ohles supplied the translation for the Porcupines' mythic utterances. /če·li, če·li/ is a distortion of /če·lis/ "porcupine," and /leĺq̓iq̓it/ may be ‖rel^{v}errbal‖. ‖l^{v}eq̓ya‖ means "puts a round object in the road, way," but it may either have a specialized meaning (presumably "on the wrist") or this may be another morpheme.

[196] [32] This utterance begins on a high pitch and descends to voicelessness.

[196] [33] Mallard's cry was said to be onomatopoetic. Not only does the mallard cry "/We·qe·qe·q!/" but also "/no·s hay dak ?aysis stintisamni/." The translation of this latter portion is Mrs. Ohles'. It seems to mean "?aysis rather intended to love me!" No negative appears, but Mrs. Ohles translated it as "?aysis never tried to love me."

(337) Then those little Porcupines said, "Porky, Porky, wish someone would cut our [wrists]! Porky, Porky, wish someone would cut our [wrists]!" (338) They sang and made dust on ʔaysis. (339) Then even when he got better, he lay there.

(340) He asked them to make him a cane. (You've seen the knobs on trees? He asked them to make him a cane out of that—with a young tree knob on it, I guess you would say. I don't know how it was called.) (341) And he said, "And I can raise myself [with this cane], while you are gone." (342) And when he was better, he lay there thus. (343) Then those little Porcupines came and said, "Porky, Porky, wish someone would cut our [wrists]!" (344) Then again they danced and danced. (345) They danced, thinking him to be sick. (346) Then he killed them. (347) Then he cut [the wrists] of all the Porcupines. (348) In this way he cut off their feet. (349) Then with their quills he made beads for [his wives]. (Did you ever see Grasshopper's necklace? Yes, Grasshopper wears a necklace around her neck.) (350) Then he made moccasins for them thus. (351) Then they were very, very proud. (352) Perhaps he made earrings too. (I don't remember well—for a long, long time I haven't heard that myth. Perhaps [when I was] small, when I heard it last time.)

(353) And they dug ipos, camas—they supplied everything. (354) And Grasshopper only was very, very lazy. (355) She said, "*tatatatata!*" (356) And she quickly wore out her moccasins. (357) And she said, "*tatatatata!*" (—Rub its legs together, you know, and fly up in the air? That's what it means. That's a heck of a way to say it, but that's what it is.)

(358) Then he said, "Now I will return home. Yes." (359) And he said farewell to them. (360) "You [pl.] live well! (361) Now you have everything." (And he fixed everything nice for them before he left.) (362) Then he returned.

(363) Then only Mallard, she said, "We·qe·qe·q! ʔaysis never tried to love me! We·qe·qe·q! ʔaysis never tried to love me!" (She didn't care whether he was dead or what happened to him—all the others were mourning:

mourning: łoho·s. q̓lidi·s—ah, I started to say something in English again!) (364) čoy sičkwaʔa·k, ho·t sasde·wyank gmoḱamčas dola či·ya, ma·ms qoyga gmoḱamčas, bas homas mna waaga spontgast.

---

[195]

[36] "/tisi·p! tisi·p!/" is baby-talk for /ptisap/ "father." Cf. "/kisi·bam ʔečas sitk ma·sʔa./" in Text 1 and in Note 2.

Mudhen, Sandhill Crane,—ah, I started to say something in English again!) (364) And little Squirrel, she slept with Gmoḱaḿč and lived with him, even though she recognised [him as] Gmoḱaḿč, he having thus cuckolded his son.

(365) Now then ʔaysis came home. (366) And Snowbird had a son. (367) And [he was] being carried on [her] back—she was making wokas maybe, or perhaps grinding something. (368) Then that baby knew ʔaysis. (369) And he said, "Daddy! Daddy!" (370) "Careful! Careful! Don't do that!" (371) "Ohhh, why did you thump him? (372) This is me here." (373) Then she said, "čikčíkčíkčiki" flying onto [him], flying onto [him] now being home. (374) She was very, very happy [to see] ʔaysis—Snowbird. (375) Then he perhaps gathered his wives again.

(376) Now then he ordered his little son to throw Gmoḱaḿč's heart into the fire. (I don't remember well—perhaps in your myth it told how it was.) (377) But I think that he had five hearts, that Gmoḱaḿč. (378) And he put his heart[s] into his feet. (That's what I don't remember well, I being thus. I don't like myths!) (379) However, he threw the heart[s] into the fire, Gmoḱaḿč's. (380) Then those heart[s] popped out. (381) Popped up. (382) Then like pitch they all dripped down, all over.

(383) Then ʔaysis put [his family] underneath—under what? In a cave? Perhaps on the mountain—he put them under something. (384) And he said, "Don't look out!" (385) And it was dripping down this way, something, like pitch. (386) And Mudhen did not mind, and looked out. (387) And it dripped right here. (388) And [on] another also (—they've got brown spots on their noses where that is supposed to have dripped on them.) It dripped on their faces. (389) And being burned, they went back under. (390) (And I can't recall how it was, how it happened, it having been so long. (391) Now perhaps that's as far as [it goes], I don't know. (392) Maybe I went to sleep while they were telling myths.)

4. Section 3: The Red-Haired Woman of Sprague River
(Mrs. Pansy Ohles)

539*

The beginning only, as recorded on tape.

(393) Even having refused, I will tell you this. (394) However, you put it on paper a little while ago, you did not put my myth on this [the tape-recorder], which you are having me tell on this. (395) However, I will tell you, as I remember. (396) I don't recall it all, perhaps.

(397) So once there lived a little old lady, having many children. (398) And there were perhaps five sons. (399) And one daughter, red-headed. (400) And she had long, long hair. (401) But she was evil.

(402) Now being grown-up, as I recall. (403) Now being grown-up [lit. "big"], she got married, to somebody, I don't know from where. (404) However, she didn't live at home. (405) But she kept returning [to her parents' home], always. (406) And she was in love with one of her younger brothers (—elder brother—I don't know). (407) But [it was] the young one, who was the youngest male. (408) And always returning to her mother, she wanted that little brother to take her home again. (409) And he didn't want to. (410) The Mother said, "He will take you home," and she didn't want [any other brother to do so]. (411) "I don't want him." (412) And they all got ready. (413) And she was not satisfied, with her elder brothers, because she wanted the little one. (Perhaps he was married? The little one, perhaps all of them, were married—I don't know. And I almost told it thus awhile back, I don't recall this well.)

(414) Then the little one took her home. (415) And it got dark on them, somewhere or other. (416) There they made camp. (417) And that girl being very passionate [?, lit. "strong"]. (418) There they laid down their beds. (419) And they lay down one on each side of the fire. (420) And her brother wanted to go to sleep. (421) And [when he was] asleep, she crawled in [with him]. (422) And she pillowed [his head on her] arm. (423) Then early in the morning he awoke, at dawn, that man. (424) And he said, "What a fool she is!" (425) And he very slowly crawled out and found a [tree] limb, a big one, having two little limbs. (426) And one he just put under her head, and one over her. (427) Then he went home, there.

(428) And to his mother he told it there thus, "How she [did] to me!" (429) And he told her everything, how she did to him. (430) And [the mother] said, "Something very bad will come upon us. (431) She is evil." (432) She spoke thus [about] her daughter.

#539 (433) čoy honk ʔat ʔa·di· dini·gistga ʔat hok sńewe·ts sgiso·la, hok taktak ńos gitk. (434) čoy honk ʔat gembli, mo··· s?awi·gank. (435) čoy honk hok wele·qs mo··· sińamsta. (447) čoy honk ʔat hok taktak ńos gitk ʔambotdat mat či·ya. (q̓ay no· s?aywakta waq hadakt gews—dam honk hospalhyok hadakt gewa ʔambotdat.) (448) čoy da·ts hok wele·qs sdiẏatga sanĺakdanga (—molded those kids together with pitch—and I can't say it in Indian, so I'm saying it in English. waq bas!) (449) čoy honk ʔat la·ba ńos gitk hok. (450) čoy da·ts honk na·nok waytas honk ʔibe·ĺa, honk hiswaqs gist. (451) čoy da·ts honk čosak sdoli·. (452) čoy da·ts honk ʔat mo·ni giwk, čoy honk dalči sʔotĺi·ya, pĺe·wip mna.

(453) čoy honk ʔat hok pĺe·wip naʔas gi, "q̓a···y ʔi ḿaYas mi ale·wapk! (454) q̓ay ʔi dada· genwapk do·st mis sḿaYĺagwapk." (čoy honk hok—q̓ay sʔaywakta dwa· bas waq giwk naʔas gist.) (455) čoy honk naʔas, "q̓ay mi dalči ẏo·wallgwapk, blaydaĺ. (456) ʔaMĺa ʔams Jiji·ks galčwiwapk." (457) čoy honk naʔas, hok pĺe·wip, "čoy nas mis ni sdoli·. (458) čoy ʔins dič dommi·wapk!" (waq bas! q̓ay ni sʔaywakta.) (459) čoy da·ts mo·ni, danq̓il bas ʔiLo·ls q̓ay ni sʔaywakta.

(460) čoy honk dińa· aleʔa la·ba ńos gitk giwk. (461) čoy honk ẏo···wallga, mna dalči. (462) čoy honk dalʔa·k datglamdaĺ sas sinčaktga. (463) čoy honk Na·ẏant Na·s he·llga gidabdat, sńewe·čĺa. dam mis ʔat ĺada·di hak?

(433) Now then long after sunrise that woman awoke, that red-headed one. (434) Then she returned, being very, very angry. (435) And that old lady was very much afraid. (So how did they do—how did they do? I don't know how those men, all of them, did. They didn't just go out. I don't know.) (436) Then she burned them up, the woman, perhaps lit them with her red hair.

(437) However, she did not burn up her mother. (438) And while it was burning—perhaps before it burned—Meadowlark dug a hole, being very pregnant. (439) And she turned something over upon herself—a mortar, a big one. (440) And there her back was burned through. (441) However nobody knew it. (442) And at last when it had finished burning—and at last when it had gone out, the old lady went into the [burned-out] fire, [to see] whether anybody had escaped. (443) And she there turned over that mortar. (444) And she found her, her daughter-in-law, with a burned-through back, that Meadowlark. (445) However, nothing had happened to those babies. (446) And she took them out, two, one girl, one boy. (Thus I heard, [when I was] little. Not now. Nobody tells myths lately. And because I am that way, I forgot some. Yes, I have forgotten much.)

(447) And they say that that red-headed one lived in water. (I don't know how she went there—whether because she was put in she went there into the water.) (448) However, that old lady stuck [them] together with pitch. (—molded those kids together with pitch—and I can't say it in Indian, so I'm saying it in English. What now?) (449) Now he had two heads. (450) However, she took care of him every day, he being a man. (451) However, she always advised him. (452) However, since he was grown up, she made an arrow for [him], his grandmother.

(453) Now then the grandmother said, "Don't look at your shadow! (454) Don't you ever go where you'll make a shadow." (And so—I don't know what-all she said to him.) (455) And she said, "Don't shoot your arrow up, straight up. (456) Maybe something dangerous will come upon you." (457) And she said, that grandmother, "Thus I advise you. (458) And you listen to me well!" (What now! I don't know.) (459) However, he was big, how many years [old he was] I don't know.

(460) And once he saw that he had two heads. (461) And he shot his arrow up. (462) And straight down the middle it split them. (463) And one jumped down on one side right here, a little girl. Is that far [enough for] you?

/

Introductory Note to Text 5

#539
114
124

This text, like Text 4 above, seems to be only a fragment of a much longer myth cycle. Gatschet's published collection[35] does not contain a story about Swa·ya, but Curtin's "Myths of the Modocs"[36] includes one myth about this character. It seems worthwhile to record Mrs. Ohles' version here in hopes that future work among the Klamaths will fill in the gaps.

[128]

The text has been edited somewhat to delete false starts, hesitation forms, and irrelevant material. In one or two places forgotten material was added later at the time of translation.

5. The Story of Swa·ya

[124]

[37] Mrs. Ohles later elaborated upon the action described here. Frog takes baby Swa·ya and places him upon a leaf (or some such thing—Mrs. Ohles was not certain just what) and lets him float down the river, then pulls him back in again by a cord. This soothes Swa·ya and puts him to sleep. She gradually extends the cord until he is completely out of sight. Then she jumps in and swims off with him.

5. The Story of Swa·ya

(Mrs. Pansy Ohles)

539*

(1) Once that little Swa·ya's mother and father lived somewhere. (2) And Frog baby-sat for them there. (3) The little boy there was very pretty, looked very nice. (4) And every day she caused [the baby] to float back [on the river], that Frog. (5) And she put him to sleep that way, floating [him] in the little river. (6) Continually floating him downstream, she pulled [him] back again, then floated him again. (7) Then someone said, to his mother, "Do you let her do that?" (She said, "Do you trust her to do that?" And (his mother) said, "Yes, she's good. She'll keep my baby from crying, and she puts it to sleep that way.") (8) Then every day she floated [him] out a little farther. (9) Then she pulled [him] back again. (10) Now then she stole [him], having floated [him] out. (11) And she jumped into the water together [with him] and went.

(12) Now then she arrived there, there where she lived—whether on a mountain, perhaps on the lake, or wherever she was living. (13) And her relatives met her, being glad [to see her] there where she lived. (14) And

---

[124] [10] Here, too, the informant explained the action in English. Frog's people do not believe that Swa·ya is her baby because he is so pretty and she so ugly. They ask her how this could be, and she explains that she gave birth to the baby on a special blanket. They prepare a blanket just as she has described, but the only babies she has are little frogs like herself. After three attempts, they declare that she is a thief.

539*

they said, "Ohhh, where did you [get] this?" (15) "There I [got] it—somewhere."

(16) Then they put something down for a bed. (17) Having put something down, [according to] what she said to do, they said, "Aaah, that's no good! (18) Now we will take you there." (19) And only little frogs jumped off, when they shook out the blanket. (20) Only little frogs, her little girls only. (21) Three times perhaps they tried to do it that way. (22) And they said, "You stole this [baby]!" (23) It always happened that way.

(24) Now then he grew up. (25) He became very big, a man. (26) And she said, "Don't you ever do evil to these, [your] sisters. (27) And he said, "Yes, I [will never do anything to] them." (28) And then somebody told him, "You are a stolen [child]." (29) Then he cried and cried. (30) "Why are you crying?" (31) He didn't eat, now he cried, always, [because] of what someone said.

(32) Now then that Frog, because she was going somewhere, said, "You be good to them! (33) Don't make them cry!" (34) And he said, "Yes." (35) And he made bracelets for all of them. (36) And earrings. (37) And they sat by the fire. (38) Then he killed them all. (39) Then he left, that Swa·ya now. (40) He killed his sisters and left, and they lay in the fire all curled up.

(41) And then Old Frog returned. (42) And she cried and cried. (43) "How you have played with them," she said. (44) Nobody pitied her, when she cried. (45) "You stole him!"

(46) Now then he returned. (47) Somebody or other told him where to go. (48) And Louse lay in wait for him on a rock. (49) And [Swa·ya] said, "What are you doing, staying here?" (50) "Why, I'm lying in wait for Swa·ya." (51) "Don't do it that way. (52) Here, let me show you how to lie in wait for Swa·ya." (53) Then he squashed [Louse] with his thumb.

(54) And again somebody or other came. (55) And he stepped on him also. (56) And he went on. (57) And then somebody or other met him—perhaps Gmoḱaḿč? (58) And he said, "They are looking for you there, your mother and father. (59) And do not shoot any antelope, because that is your mother, having a spotted teat, on one side."

(60) And he went on and on. (61) And many things [i.e., creatures] met him on the way, lying in wait for him. (62) And he always killed them, whoever [they were]—Flea, Louse, Ant—whoever. But [there were] many.

[196]

[19] The word /qoqdinks/ has the basic meaning "dragonfly," but it is commonly used as an expression for "batchelor." Since the batchelors talk all night and do not let him sleep, Swa·ya turns some into women and thus settles them down. This myth incident seems to reflect in story form the linguistic phenomenon of double meaning—or could the double meaning of /qoqdinks/ be derived from the myth?

(63) And he was very, very gloomy. (64) And he camped at the Dragonflies' place. (65) And they did not let him go to sleep. (66) They made so much noise, because they were batchelors. (67) Those Dragonflies were [composed of] only men. (68) Then little Swa·ya said, "These [people] are disturbing me very much!" (69) Then he made some of them [into] women, those Dragonflies. (70) And having done that thus, there have come to be many, many dragonflies, because some became women.

(71) Now then those Dragonflies were very, very stupid. (72) And he left the next morning. (73) And one of the Dragonflies caught up with him and said, "Now my wife is pregnant. (74) How should we do?" (75) And he said, "You certainly make me tired!" (76) And he said, "You will do thus!" (77) And he told them, he prescribed something or other [for] them. (Just like you go to an Indian doctor and ask him what to do. "My wife's pregnant." And he told them what clothes to get, or moss, or whatever they used at that time—rabbitskins or something.) (78) He advised them whatever to get.

(79) Now then he went on. (80) Then he saw, an antelope. (81) And then he forgot. (82) Those Dragonflies had quite confused him. (83) Then he shot, that antelope. (84) And he killed his own mother. (85) Then because of that he was sad. (86) "If I could kill my mother, then I could kill anybody at all!" he said.

(87) However, he came then to the Pelicans' place. (88) I forget whose place he came to first. (89) But he came to the Pelicans' place, they [being] five, brothers, five. (90) And they were blind, all blind. (91) And then they were roasting their fish. (92) Then in order to tease them, he took [one fish] from each one. (93) They were roasting five fish [each], those Pelicans. (94) And he took one away from each there. (95) And those Pelicans ate only four each. (96) And [since] they could not see, he hid from them. (97) And sitting in a corner, he ate them all. (One from each of them.) (98) And then one—perhaps the eldest, or perhaps the youngest—said, "I have swallowed only four!" (99) And [another] said, "I also [had] only four!" (100) Again one [said], "I also [had] only four! (101) Why, we roasted five apiece here! (102) Let us make wind!" (103) Then they flapped their wings. (104) Then a very dusty wind blew there. (105) Then [Swa·ya]

[196]

---

[a] The quoted material in utterances 105, 106, and 107 is given in a high, faint, faraway voice, since Swe·ya wished to fool the blind Pelicans as to his location.

539*

said, "I did that to you-u-u! (106) I ate your fish! (107) I took one away from each of you-u-u!" (108) Then they said, "Listen! Who's that?" (109) "I am the one! Little Swa·ya!" (110) Then they said, "Oh, Grandfather's Brother! (Grandfather's Brother, Mother's Brother—I don't know which.) (111) He did that to us." (112) "I'll go and get some more for you." (113) Then they were happy. (114) And he went and fished for them. (And everything was all right. Now that's as far as I know this one too.)

8. Gmoḱaḿč and Little Bullhead

(Mr. Grover Pompey)

(1) Yes, Gmoḱaḿč. (2) He visited Little Bullhead. (3) And he saw those sacks [of wokas] of Bullhead, lying in a row, many. (4) And having seen them, he said, "Now I am going." (5) Then having gone a little way there, then all his armpit hair—then having pulled out all his armpit hair, he made people [out of it]. (6) Then he returned. (7) He ran in front, to Bullhead's place. (8) Then he called, "Pe-e-e-ople are coming! Jump in the water, jump in the water!" (9) But long before, she had jumped in the water, having guessed him, Little Bullhead. (10) She said, "Whatever would this [fellow] pick up?" (11) And having picked up her sacks, she put them under, underneath the shelving bottom [of the river], she put them all under. (12) Then having done thus they were gone, now they were gone.

(13) Then he came running, "He···! People are coming! Jump in the water! Jump in the water! (14) Having left those sacks, jump in the water!" (15) He came running, came running, crying thus. (16) Then he said—now he arrived there at that dwelling, at that house—"What's the matter?" (17) Now he arrived at that dwelling, [and] the Little Bullhead was gone, gone. (18) "What's the matter? (19) She must have guessed me! (20) She must have guessed me! (21) What can I do? (22) Can she still be here?"

(23) Now then he began to wade [in the river], now feeling around with his feet. (24) "Perhaps she is here, in the water." (25) He waded around in the water. (26) "This is her, just as if she is here. (27) Just as if she is here. (28) Something feels sharp here. (29) It feels just like something

---

[126] [124] [41] This text was not taken on tape, but only by dictation. Mr. Pompey stated that this incident was but a small part of a longer myth cycle, though he could not recall more than fragments of the rest of it. Cf. Mr. David's text in which Q̓alo·qa·qaqs appears (Text 17).

[196] [42] The sequence /suksuksuksuksuk/ is almost voiceless, and the syllables are uttered at a rapid rate of speed. This and whistling were said to be the commonest methods of calling a dog in ancient days.

[231] [193] [196] [43] The use of (se) "reflexive-reciprocal action" (3pv) is not clear here. |sedelwga| means "attack each other" or "attack oneself," but the utterance contains an "accusative" /ćasga·yas/. Utterances in which (se) has reciprocal meaning invariably have all parties to the action as subjects.

sharp here!" (30) That Little Bullhead was cutting at him with her flint knife, all over his legs. (31) She cut up all his legs. (32) "Now it's gone again. (33) That's all."

(34) Now he waded back out, having felt around, he had only found sharp-feeling things. (35) Now he came back out. (36) Now then he saw, "Ya···, what's happened to me? (37) This one has slashed me thus, on the legs, feet!" (38) Then he went off. (39) Then after a long while Little Bullhead came back up, came back up out of the water. (40) So then from under the shelving bottom she took her sacks back out. (41) Then she put her sacks back down in the house. (42) "How he would almost have tricked me?" (43) She was talking to herself, "He almost tricked me." (44) And that's as far as that [goes].

7. Old Mink and Nighthawk

(Mr. Grover Pompey)

(1) Old Mink came with Weasel to Nighthawk's place. (2) Nighthawk said, "Let's make our dogs fight!" (3) Old Mink said, "He is not my dog. (4) We will not make [them] fight." (5) Old Mink said, "Rather he is my little brother."

(6) Again Nighthawk said, "No, he looks like a good fighter. (7) Let's make them fight!" (8) Old Mink said, "Yes." (9) Nighthawk said, "You first. Suksuksuksuksuk, Ǫapga gwaća·sis!" (10) He attacked Weasel. (11) Weasel put his walking stick behind his back. (12) Weasel killed him then, with the walking stick.

---

[196] [44] /q̓aWĺi sislakLas/ was said to mean "Brown spots over the eyes." ‖reseˀlʸikLa‖ : /sislakLas/ "distributive round objects on top of, reflexive" bears out the translation, but the usual word for "brown" is /kaWkaWĺi/ ({kaW}). The form /q̓aWĺi/, otherwise unknown, could perhaps be set up as an allomorph of {kaW} 73v "to be brown."

[194] [45] /kuskuskuskuskus/ is nearly voiceless. Cf. Note 42. There is no apparent reason for the metathesis of /k/ and /s/.

[192] [194] [46] /hõ·⋯/ is an exclamation of disappointment. The vowel is nasalized, and the tone drops from /3/ to /2/ or a little lower.

[194] [47] The segment /loha·nk, loha·nk, goda· ni p̓ača·, loha·nk, loha·nk/ is spoken in a measured, heavily stressed tone and in a rather high, faint voice. This applies to further reoccurrences of this myth speech in utterances 18, 33, 52, 53, 75, and 76 of this myth.

[196] [194] [48] /hehǰi·, hehǰi·, hehǰi·!/ is the myth-speech of Hehǰi·ḱa. No further meaning for the segment /hehǰi·/ could be found. It is uttered here in a high-pitched voice with a strong pitch drop on the final /i·/.

(13) "Now you next, q̓aWl̓i sislakLas!" (14) And Weasel killed him. (15) "You next, kuskuskuskuskus, you next, čak loĺatq̓aks!" (16) He attacked Weasel. (17) Now they fought. (18) Again Weasel slew him. (19) [Nighthawk] said, "hō···, it is very bad indeed. (20) kuskus, you next, mbastga nqewYapks!" (21) Again he [too] attacked Weasel. (22) They fought. (23) Doing thus, Weasel killed him next. (24) "You next, Q̧alo·qa·qaqs!" (25) Now he killed him too. (26) Now they attacked each other, [and] Weasel killed him next. (27) Nighthawk said, "So! Now let us!" (28) He said [to Old Mink], "We will elbow-fight!" (29) Old Mink said, "I don't know how to do that." (30) "No, I will do like that to you first." (31) Now then Old Mink [and Nighthawk] will elbow-fight. (32) [Old Mink] said, "How do they do that way?" (33) "Why now, just this way"—this way in his mouth—he showed [him] his elbow this way in the mouth, with which they will elbow-fight. (34) Now they elbow-fought. (35) Old Mink ripped open his, Nighthawk's mouth, [and] having ripped it open killed [him].

8. Hehǰi·ḱa

(Mr. Grover Pompey)

(1) There were five geese. (2) And that goose [the eldest brother] flew off one morning early, saying thus, "loha·nk, loha·nk, I'm going to eat goda·-weed, loha·nk, loha·nk!" (2) Flying, he arrived—landed, at Hehǰi·ḱa's place. (3) Hehǰi·ḱa [who had been] seated on top of his house, came running down to that goose, crying, "Hehǰi·, hehǰi·, hehǰi·!"

---

[196] [49] The Grandmother's exclamation, here /ʔe···/ and elsewhere /ye···/ (utterances 46, 66, and 96), is uttered in a high, quavering tone that varies considerably in pitch.

[124] [192] [50] Mr. Pompey here became confused momentarily between the Klamath summer house (/wqepĺaqs/) and the winter house (/loltm̓alʔaqs/). He had previously stated that Hehji·ḱa lived in a /wqepĺaqs/ at the time of the story.

(4) And he said, "What is happening? (5) Why is that burning over there—just look! (6) Just look!" (7) So that goose looked. (8) Then he hit him [with a round object], hit him on the head and killed him. (9) And having done thus, that Hehǰi·ḱa carried him back, to his house. (10) And he threw him inside, his house. (11) Then his Grandmother said, "ʔe···, have you been killing one?" (12) Now then Grandmother having plucked it all, roasted it. (13) And they ate. (14) Having eaten enough, they got full. (15) And having done thus, they now lay down.

(16) Then again the next morning, Hehǰi·ḱa was sitting, on his house. (17) And another goose again flew off, from over there. (18) He too was saying, "loha·nk, I'm going to eat goda·-weed, loha·nk, loha·nk, I'm going to eat goda·-weed!" (19) Now then he too landed—at whose house—at Hehǰi·ḱa's place. (20) Hehǰi·ḱa again ran into the way, and asked him next, thus, "What is happening over there? (21) Just over there this way—just look!" (22) And that goose looked. (23) And he hit him too, on the head. (24) Killed [him]. (25) And he took him back, to his house. (26) And there he threw him inside for his Grandmother to pluck. (27) And having plucked him, and now having roasted [him], they ate. (28) Having eaten, they now lay down again.

(29) Again he got up early. (30) Hehǰi·ḱa. (31) He sat in the same place on top of his house—of his summer house. (32) And again the next goose came flying, from there. (33) And he was saying thus, "loha·nk, loha·nk, goda·-weed I'm going to eat, loha·nk, loha·nk, I'm going to eat goda·-weed!"

(34) Now he landed—someplace—at Hehǰi·ḱa's place. (35) Hehǰi·ḱa ran off again. (36) He ran there in the way. (37) And he said, "How are you? (38) What is happening over there? (39) What is that happening?" (40) "Where?" (41) That over there—there—burning—what is that burning for? (42) Just look!" (43) So the goose looked. (44) And he struck him too, [on] the head, killed him. (45) Having killed him, he carried him back toward there, towards his house, threw him inside. (46) "ye···, have you killed another one?" said his Grandmother. (47) Then they ate, now having roasted him well. (48) They got very full. (49) And now it was again another night. (?)

(50) Again very early, was sitting on top, Hehǰi·ḱa. (51) And another goose flew off, early. (52) And in the same way he came saying, "Loha·nk, loha·nk, loha·nk, I'm going to eat goda·-weed. (53) Loha·nk, I'm going to

eat goda·-weed." (54) And he flew down, at Hehǰi·k̓a's place. (55) Hehǰi·k̓a again ran off, to his house. (56) He ran there in the way. (57) He asked, "Why is that burning? (58) What's happening?" (59) "Where?" (60) "Look over there! (61) Ho···—just—look over there!" (62) And he looked. (63) Then again he struck him too, [on] the head, [and] killed [him]. (64) Having killed him, then there again [he took him] to his house and threw him inside. (65) And his Grandmother said, "Ye···, have you killed one again?" (66) "Yes. Yes." (67) Then having plucked him too, then having roasted him, now they ate. (68) They became very [lit. "good"] full. (69) Then they again—having done thus it got dark, and again the next morning he sat on top [of his house].

(70) Again the goose flew off. (71) Now only one goose remained. (72) And he said, "What's the matter? Why—have they not returned. (73) I'll just go." (74) Now then he flew off. (75) And he came saying thus, "Loha·nk, loha·nk, I'm going to eat goda·-weed. (76) Loha·nk, loha·nk, I'm going to eat goda·-weed."

(77) Then he landed, at Hehǰi·k̓a's place. (78) And Hehǰi·k̓a came running down off again. (79) He ran in the way. (80) And he asked, "What is happening over there?" (81) And the goose said, "Where?" (82) "How it is burning over there—just look! (83) Why is it burning?" (84) "How? (85) I am looking that way." (86) "No. Look over that way!" (87) "I don't see anything. (88) Nothing is burning there, I don't see anything." (89) And that goose had eyes on both sides of his head. (90) And he asked Hehǰi·k̓a, "What is that [round object] underneath [your armpit]? (91) This one must be the one who did thus [to my brothers]!" (92) And having taken it away from him, from Hehǰi·k̓a. (93) Then in the same way he hit him on the head, and having hit him, killed him. (94) Then after having killed him, he took him to his house, Hehǰi·k̓a. (95) Now then he threw him inside something, inside the house. (96) And Grandmother said, "ye···, again have you another—" (97) She said that much, because now she saw [who it was]. (98) Now she wept. (99) And while she was doing thus, that goose hit her with that same thing, with Hehǰi·k̓a's weapon. (100) And he killed her. (101) Then having done that, now having killed her, then he burned it down, all of Hehǰi·k̓a's house. (102) And that's as far [as it goes].

[194] [31] The allophonic pattern of /kalambya riba/ "Columbia River" is entirely Klamath, except for the anomalous /r/.

[124] [196] [32] Mr. David gestured to his head and back to indicate Skunk's stripe, the area referred to by /gida/ "here" and /gidaɬ/ "toward here."

[194] [192] [33] /gen ni geńs ƙleča/ "This is the way I hop along" is the myth speech tag-line for Skunk in this myth. It is pitched slightly higher and is rhythmically stressed. Mr. David himself points out the difference between such "myth speech" and ordinary discourse in Sentences 42 and 43 of this myth.

539*

8. Skunk and His Sister-in-Law

(Mr. Robert David)

(1) I will tell—just a short narration, which I know. (2) Long ago to me—even though I don't know much. (3) However, I heard this, which the old people told me. (4) Long ago. (5) They told the myth. (6) And they told me [about] Skunk [of whom] I will tell, who lived to the north across a great river over there. (7) And the white people now call it there "the Columbia River." (8) There he lived across there, Skunk. (9) He would cross there to see his little brother. (10) His little brother lived across there. (11) And he himself lived on this side, far off on this side, on this side of that great river. (12) And he said, to his wife he said thus, "Take me across. (13) I want to go and see [my little brother]. (14) I have not seen my little brother for a long time," said that Skunk. (15) "Yes," she said. (16) Now she took him across. (17) Having taken him to the river there, she took him across in a canoe, a canoe there, as they said, with a canoe. (18) They rowed across [and] now she took him there. (19) Then he went off. (20) He just went off on foot.

(21) Now he liked to bathe himself this way. (22) He went to bathe his back, all where it is striped on top of him, white. (23) And he washed himself very well, here too, where it is striped over [his head] here white. (24) He wanted it to look very nice. (25) Having washed himself well, he went along. And he said now, "This is the way I hop along, this is the way I hop along! " (26) That was his saying when he went along, Skunk all by himself. (27) "This is the way I hop along, this is the way I hop along! " he said. (28) He liked to look at his shadow, when he went, waving his tail around. (29) Now he was pleased with it.

(30) Now he arrived far, far over there and saw very many people living there. (31) And he said, "Where does my little brother live?" (32) And they pointed it out to him saying, "He lives over there." (33) Then he said to them, "Yes, since I have not seen him for a long time, I have come across that great river," thus he said. (34) "Yes," they said. (35) Then

[124]

[24] Here Mr. David sought the word for "sister-in-law" which he had been using, but failed to find it.

he lived there for a little while. (36) However, he had told his wife before coming, "If I shout, you listen to me! (37) If I call across that river, I will want to return."

(38) His wife rowed back across to this side. (39) And he stayed there, two days. (40) Now then he came back again. (41) Now he came thus, saying as he came, "This is the way I hop along! This is the way I hop along! This is the way I hop along!" (42) I don't know what it was, whether it was a song, or whether it was a little saying, thus. (43) However, that was what he did.

(44) Now he arrived back there at the bank of the river. (45) And he called, "Co-o-ome get me!" he said, "Co-o-ome get me!" (46) Now that wife rowed across, having heard. (47) And she landed there. (48) Then he said, "I don't want you. (49) I don't want you to take me back. (50) I want [my] sister-in-law." (51) "Yes," she said, and rowed back across. (52) That woman rowed back across. (53) "He wants you." (54) And she said, "Give me something [of cloth], which I can cover him with," she said. (55) "And I will cover him, wrap him all up!" (56) Now then they did thus. (57) Now they found something, big. (58) Now they tied him all up here everyplace, wrapping him in something big, his whole head.

(59) And she said, "I don't want other women to see you. (60) I don't want them to look at you," she said. (61) She explained something thus.

(62) Now she rowed him back. (63) "Yes," she said. (64) They placed him well in the end [of the canoe] and said, "You will stay right here! (65) And you won't do anything bad, bumping your head there." (?) (66) Then they placed him at the end, at the end, in the bow, in the canoe. (67) Then they did something. (68) However, she ruled thus—that woman, his something-or-other— (69) "If you do anything, when [we] have rowed halfway, you'll tip over that canoe thus." (70) Then they did thus. (71) Now when they had come halfway, then he tipped it violently, the canoe. (72) And he fell into the water there. (73) Now he fell into that river. (74) Always there.

(75) Now she rowed back, having done thus. (76) And there it does something—the water there whirls around very much, there where that skunk fell in. (77) It is very deep thus—it whirls there, that Columbia River. (78) It is a huge river. (79) This way it whirls very much. (80) No one can cross it there with some little thing even now. (81) And thus it goes. (82) I have told you a little of it, which I know.

10. The Crater Lake Myth

(Mr. Robert David)

539*

(1) Again I am going to tell one, which I know—although not very well—I don't know all of it. (2) But rather what they told me, and I recall. (3) And I will tell about Y̓amsi·, where that Weasel lived long ago. (4) And Old Marten lived with him, being him. (?) (5) They camped there. (6) And they went to get water always, having gone a little ways to some well. (7) That well of theirs was good, there. (8) And that Weasel used to keep going after it, water. (9) Now then once he went after water. (10) And he said, "What a be-e-eautiful girl is sitting there on the bank," he said, "At our well. (11) A lovely girl—with long, long hair," he said.

(12) Then that Old Marten said, "Just be calm!" he said. (13) You don't know who she is," he said, "But I know her," he said. (14) "That girl is evil. (15) If you want a woman, then get married to that one-eyed [one], who is digging [roots] over there." (16) Lying down he said thus, for he saw everything that was happening even very far away. (17) That Old Marten—he knows so much. (18) Then he said, "There are many women there digging—camas root," he said. (19) And you take that one, who is one-eyed, having just one eye," he said. (20) "Having just one eye, she is industrious," he said. (21) "She is nothing at all, of whom you spoke."

(22) "Why do I have to take one like that?" [Weasel] said. (23) "I don't want that kind," he said. (24) "I want a pretty woman."

(25) Now then he ran back down over there. (26) "I will go and see her!" (27) He, however, paid no attention, for now he was lying down, that Old Marten. (28) But he was watching even from there.

(29) Now [Weasel] was lying around in her lap this way. (30) And she said, "Would you let me do something to you?" (31) She was carrying something, something this long, very smooth, well made. (32) And she said, "Take this in your mouth," she said, doing to Weasel. (33) "Take this in your mouth!" she said. (34) "I'll put it in your mouth for you," she said. (35) Now he lay on her lap, as she sat there. (36) And she said, "Take this in your mouth! (37) This is nice," she said, "This is something nice," she said. (38) Now then she made him open his mouth wide, wide. (39) "Open much wider!" she said. (40) Then he opened his mouth very, very wide. (41) Now then she shoved it in, that woman. (42) Now she shoved it through [him], [and] fished out his heart. (43) Now she fished out his heart, doing thus, to Weasel. (44) "Now they are doing it there," said Old Marten. (45) Now he was watching as they did thus.

---

[35] /gida·na/ "on here" was explained by a gesture indicating the face and head. Sqeĺam̓č had disguised himself as an old person, leaning on a staff, with his head covered with pitch (a sign of mourning). He thus convinces Le·w that he is not Sqeĺam̓č and that he wishes to take revenge upon Sqeĺam̓č for having made him old and ugly.

(46) Now then having taken that heart, she now ran back toward Crater Lake, that woman. (47) She was from there, from Crater Lake. (48) And they, again it is told thus (?), having arrived back, there were a great many [beings] there where it is so flat on the other side of Crater Lake. (49) "The Ball Court" it is called. (50) It is thus. (51) Afterward they named it "The Ball Court." (52) It is very, very flat, there on the other side of Crater Lake. (53) And many lived there, various things. (54) And they did not like Gmoƙaḿč. (55) The "Le·w," who lived there at Crater Lake. (56) The "Le·w," as he is named, he lived there. (57) He lived in the water.

(58) Then having run back there, the woman said, "This is Old Marten's heart! (59) This heart is Old Marten's!" (60) And they said, "Ye-e-e-es!" (61) And they spread out [on the Ball Court], everything—deer, those, everything that lived there.

(62) And they said, "Yes, we will play ball with that heart of his!" (63) And it being thus, they threw it back and forth. (64) Just as they [play] ball, they threw it back and forth, running here and there. (65) Everything, deer, antelope, they [were] [various] things. (66) Like that they did it thus. (67) And—they did thus for a long time.

(68) Now then that Old Marten, he came now. (69) Then he arrived after a long while, very old, leaning [on his staff] with difficulty, that Old Marten. (70) He arrived leaning [on his staff and] fooled them. (71) Yes, he came supporting himself much. "He made me this way too there!" (72) And something—having pitch on his face here—pitch, yes, all over.

(73) And he said, "He made me this way too," he said, "I am his doing." (74) And he said, "He did thus," he said. (75) "He does all of us wrong, [and] he kills us," he said. (76) And he does thus—I also want to catch it once," he said, "his heart." (77) I want to catch the heart just once. (78) Yes, I want to catch it. (79) So throw it to me!" he said.

(80) Now then they threw it to him. (81) Then he caught it. (82) Now then he ran off, just when he caught it. (83) Now he came running back this way, towards Y̓amsi·, from whence he had gone. (84) Now he came running back. (85) And they ran off [after him]. (86) Now they came chasing him. (87) And he changed into [various] things. (88) Again a stump stood in the way, he having become a stump. (89) Yes, again having become something else, he stood in the way. (90) Again they did not know what.

[19]

[36] The sequence /ʔo···í, ʔo···í/ represents Dove's cry and forms the onomatopoetic basis for this bird's name. This utterance was given in a faint, high, far-away voice. The faintness of Dove's cry made Sqeĺaḿč's pursuers believe that he had outdistanced them, although he was really close by.

[124]

[37] At this point Mr. David recalled a portion of the story which he had omitted. He explained that it should have been inserted somewhere near Sentence 83 of the present text. Sentences 107 through 111 are more or less a résumé of the action, resulting in the killing of Le·w. Sentences 104 through 106 were improvised material giving continuity to the story in spite of the error. Sentences 112 through 127 form the main part of the omitted section.

(91) And further on, that Dove said—sitting up high, spoke. (92) He was together, [with] Old Marten. (93) And he said, "ʔo···í̥, ʔo···í̥," Dove said. (94) And those running along said, "He has gone very far, he speaks from afar," they said. (95) Dove spoke thus—even though he spoke sitting up high right there. (96) Now then they quit, it being thus.

(97) Now then Old Marten took it [i.e., the heart] home, and now there, now he pushed it back into little Weasel. (98) "I told you so," he said. (99) "Now do you know?" he asked.

(100) Now—a little is not good—something else also goes first. (101) Yes—no, it's told differently. (102) There where the Le·w lived, as I told it earlier. (103) However, let it be later here—I'll make it later.

(104) Now then having put [Weasel's heart] back inside [of him], he said, "We will attack them," he said, "We will attack them! (105) There toward Crater Lake." (106) Now Old Marten got ready, being angry now. (107) Now then having climbed down there [into the Crater] they did something—they killed the Le·w, having gone. (108) And they did something, [and] those who were with him [i.e., the Le·w] did not know it. (109) Having killed him, now they tore up all his body into pieces. (110) They tore up the Le·w's body, all. (111) And having done thus, they threw it down, being there on the cliff.

(112) And [Old Marten] said, "This is Marten's thigh! (113) This is Marten's leg! (114) This is Marten's heart!" he said. (115) Now he threw it down. (116) And they having risen up out of the water, gobbled it up. (116) Now it turned quite white there [with foam, bones, and the creatures themselves]. (117) Even only bones they gobbled up then, [of] that Le·w who lived, at Crater Lake. (118) And finally he said, "This is Marten's heart!" he said, "This is Marten's heart!" he said. (119) He threw it saying, "This is Marten's heart!" (120) Now they did something—now all doing thus. (121) High they—many lived thus. (122) And they did not miss, when they threw it down. (123) So somebody seized it, from that side, perhaps from this side, that, which they threw down.

[192]
[196]

[38] The phrase /qawdo·gi· agoč agoč/ is again myth speech, a tag-line for the various Qawdo·gi·s brothers. It had no discoverable lexical meaning. It was spoken in a rhythmical manner, but was not noticeably high-pitched.

539*

(124) And finally he said, "This is Le·w's!" Le·w's is this thigh! " he said. (125) Now indeed they ran up out of the water. (126) Now they knew it was so. (127) Then they returned, having done thus, now they ran back, Marten together with Weasel.

(128) And thus far [I] know, anything different, I can't recall now. (129) Rather this is as far as I know it well. (130) A long time ago, to me, even though it is good. (?) (131) But I know just this much, however. (132) I do not wish to tell that which I do not know.

11. The Qawdo·gi·s Brothers

(Mr. Robert David)

(1) Once—there lived many. (2) I will tell something, of the Qawdo·gi·s. (3) The Qawdo·gi·s lived across there near Pelican Bay. (4) They lived there. (5) And they heard thus, someone had killed many, many deer, at the edge of the timber there. (6) There they had built a big fire. (7) And he saw—that one Qawdo·gi·s—he saw it, the fire. (8) "Why is it burning so over there? At the rich people's place," he said. (9) Now he said, "Why, they must be bringing meat home, they've been killing deer," he said. (10) And he watched it from there, looking across so far, there at the edge [of the timber], there by Fort Klamath.

(11) And he said, "Ya···, I'm going," he said. (12) And he went off—they were brothers, four. (13) And the oldest went off. (14) And something—he went and went over there. (15) And he met them on this side. (?) (16) This kind, the same one—Gmoḱaḿč (they call him)—Gmoḱaḿč met [him?] on this side. (17) Now he said, that Qawdo·gi·s, "Indeed, what is that burning so much?" (18) Just said, however, "Qawdo·gi· sgoč sgoč, qawdo·gi· sgoč sgoč," he said as he went, that Qawdo·gi·s. (19) "Qawdo·gi· sgoč sgoč," he said, carrying his arrows, everything, being ready as if he were going hunting.

(20) Now he met him, Gmoḱaḿč, he [i.e., G.] having become an old woman. (21) And he said, "They have a heap of deer meat over there,

[9] The form /wgaps/ is doubtful. This is what seems to be from the tape, but Mr. David was not certain of it on hearing it again, nor could he reproduce the utterance. He felt, however, that the translation given was what belonged there.

there where it is burning so," he said. (22) And Gmok̓am̓č said, "They gave me a little piece, a bit of fat," he said, "They gave me this little piece of fat," he said. (23) "But if you will do thus, I'll give you this little piece," he said. (24) "And I'll put it into your mouth," he said. (25) "With a sharp piece of wood like that I'll put it in your mouth." (26) He said to that Qawdo·gi·s. (27) "I'll put it in your mouth, only thus can you eat this, not taking it with your hands," he said. (28) Then he did thus. (29) "Just open up! " he said, "And I'll poke it into your mouth." (30) And he said, "That's the way it tastes," he said. (31) Now then that Gmok̓am̓č having poked it into his mouth—here—poked it into his mouth with something sharp. (32) And that same way, he now poked it through his heart. (33) Then he died, right there.

(34) And again, now he was gone a long time. (35) "Where can he be? (36) The old man being gone, he's absent a long time," he said. (37) "This way I'll go and see also," he said. (38) Now he followed him [lit. "was one having followed . . ."], who was his next smallest brother. (39) Now then he went, just that way, singing thus as he went, "qawdo·gi·s agoč agoč, qawdo·gi·s agoč agoč." (40) And he did it in just the same way.

(41) And the same one met him again, doing thus. (42) Now he met him again. (43) Now in just that way, thus he told him, that way. (4) "Only having done thus can you eat it," he said. (45) "This is the way it tastes good," he said, "They gave me this much," thus he said. (46) He—Gmok̓am̓č said, "They gave me this little bit"—being an old woman, his head all pitch-covered. (47) Very, very old, "They gave this much to poor me," he said. (48) "If you'd taste it," he said, "So that's the way it tastes," he said. (49) Then he put it into his mouth in the same way—"However, I'll put it into your mouth, you not taking it yourself with your hands," he said. (50) Then he poked it into his mouth. (51) Then having poked [his heart] out, he killed him, too.

(52) Now having poked [his heart] out in the same way, of those two left behind, another one came. (53) Another one in the same way, now he killed them. (54) And Old Marten said, "They made me this way, so I for that reason [did it to them?]. (55) I didn't do it to them for nothing," he said. (56) "They did it to me this way," he said,—that Old Marten.

(57) And so he—thus he said. (58) And there where I spoke of, Indians long ago called it "Camas Place"—"Camas Digging-place." (59) There it was "Camas Digging-place." (60) And it happened there thus, long ago, which is as far as I know.

12. The Old Lady on the Prairie

(Mr. Robert David)

539*

(1) Once an old woman lived on the Marsh [i.e., Klamath Marsh]. (2) This side—on this end of the Marsh. (3) That land was narrow there, the plain [i.e., a narrow extension of the grassy marsh-plain lay between growths of timber]. (4) And they used to travel that way. (5) They travelled that way, crossing that little plain, now. (6) And the little old lady heard thus, that they had killed a great deal of deer, there at Y̓amsi·, here at Y̓amsi·, thus [they] said. (7) People from here—having gone killed—killed deer in the autumn. (8) Very, very fat deer.

(9) And she said, "I'll wait for them right here. (10) I cannot go," said that little old lady. (11) "I'll wait for them there on the edge [of the timber], from where I know they'll be returning."

(12) Now then she waited for them. (13) So one came, carrying a lot on his back, very, very good meat. (14) And she said, "Could you give me even a little bit of fat?" she said. (15) "I am poor," she said, that little old lady. (16) "Yes," he said. (17) So he gave her—very much he gave her and left. (18) "Yes, this [person] has done well to me," she said. (19) The little old lady returned then, carrying it on her back. (20) Now then two came past in the same fashion, well. (21) Now they gave [some meat], to the little old lady.

(22) So then one—one who was mischievous came last. (23) And he said, "Why should I have tired myself out for you?" he said, "I have travelled very, very far. (25) But you stayed right here," he said. (26) "And why should I give it to you, [having gotten it with] so much trouble?" he said, speaking to that little old lady.

(27) Now she was sad, the little old lady. (28) "You didn't do me well," she said, "You have done me wrong. (29) You know I am poor," she said. (30) Now then he came on back carrying [his deer meat], not paying any attention. (31) "Yes," she said, "You just go on back there!" said the little old lady.

(32) Then he came, having crossed that plain halfway. (33) Now then it began to get very, very heavy, that that he was carrying. (34) And it began to move back and forth also, move back and forth on his back. (35) Now it moved back and forth on his back. (36) But he left it alone and went on, that person. (37) And he came to the edge, there where the trees are. (38) Now then he saw here [that] they looked him in the face, they became snakes, that meat. (39) She made them snakes, that little old lady, she made it into snakes, all the meat which he had dried. (40) Now it being thus,

hok hoḿas gist, honk wbečḱo·ta, ʔat hoččá hokt, maqlaqs ʔat. (41) ʔat honk hoččambli, ćoani gina·daĺ hoččipgabli. (42) hoḿas honk wale·q́a·k, honk gist dińa· gi. (43) nen ḱada· ni.

13. Coyote and the Thunder Bird

(Mr. Robert David)

(1) sʔabwapk ni honk ka hak ḱolýa·ʔas, kant ni sʔaywakta. (2) dińa· honk ýayńatdat do· damnon, ḱolýa· ho·t. (3) čoy honk domna honk, lmeys. (4) lmena· hok. (5) čoy honk naʔas, "dwa· dal nen lmena·? (23) čoy honk ʔat gitgo gi—"ya···, dič hay ʔi nen gi!" či honk ḱolýa·, "dam bas no·č hoḿas git?" či honk. (24) "hoḿas hay gi!" či honk,

he threw it as he ran, that person. (41) Now he ran back home, came running back here for good. (42) Thus the little old lady, [that was what] she did once. (43) That's as far as I [know].

Introductory Note to Text 13

This is essentially the same myth as that given in Text 3 by Mrs. Ohles. There are, however, some interesting points of difference: Mr. David's version employs a less elaborate method of tricking Antelope out of his eyes, and the ending of this text has also been expanded to include an episode in which Gmoḱaḿč replaces Antelope's eyes with better ones made from clay and mica (as was explained later in English by the narrator). The story is thus given a "happy ending," and a mythic reason for Antelope's protruding eyeballs and exceptional vision is also included.

13. Coyote and the Thunder Bird

(Mr. Robert David)

(1) I will tell about some Coyote or other, that I know. (2) Once he was wandering there on the mountain, that Coyote. (3) And he heard it, thunder. (4) It was thundering. (5) And he said, "What is that thundering? (6) What is doing that?" (7) And he looked, [but] did not see it. (8) And it kept on thundering. (9) So he searched, [for] he wanted to see what was thundering, that Coyote.

(10) Now then he saw it. (11) And sitting up high, a little bird like that, he [was the one]. (12) The Thunder Bird, as they called him, people—the Thunder Bird, he was thundering. (13) Yes, the Thunder Bird, as that little bird is called. (14) So he saw him. (15) "Are you the one making all that noise?" he said. (16) "Is it you thundering? (17) How did you do it?" he asked him, that Coyote. (18) "Doing this way," he said, plucking out his eyes. (19) Then he threw his eyes up, very, very high. (20) He threw them up, that little Thunder Bird. (21) Yes, throwing them up, having taken out his eyes. (22) And he said, "Do it this way, and then it thunders."

(23) Now then he did something—"Ya···, you do that well!" said Coyote, "Can I do it that way too?" he said. (24) "Do it thus!" he said, "Having

[196]

[60] /diča ʔa nen Walta./ "It sounded good." refers to the sound of running water, which Coyote fancies he hears in the distance. The sequence of objects indicate his progress toward water: first a dried stump, then a ponderosa pine, then snowbrush and saugus-berry bushes (fairly neutral as regards their nearness to water), and finally cottonwood trees and willows, which grow close to streams.

thrown your eyes out, then throw them up, and you'll hear it. (25) If you throw them up high, then it does it well," he said, "sounding strong."

(26) Now then in that way he threw his eyes up, having taken them out, that Coyote. (27) And it thundered, sounding very, very strong. (28) He made it thunder for him, that little bird. (29) That Coyote himself did not—he did not know it, to do it himself. (30) And he thought, "I'm the one—now I thundered thus!"

(31) And [the Thunder Bird] said, "If you'd go up high on the mountain, you could throw up your eyes thus, and it thunders a long time, strongly, just as you hear it thunder there up high." (32) Thus that little bird told him. (33) "Throw your eyes up high," he said, "and having thus gone far, far up on the mountain." (34) Now he did something that way, having taken out his eyes, he threw them up very, very high. (35) And it sounded once thus, now the little Thunder Bird told him to do it that way. (36) He made it sound once, and it thundered thus very, very strongly. (37) Now his eyes fell back in again. (38) Now he said—"Now I'll throw them up higher," he said, "It would sound better stronger," said that Coyote. (39) Now he threw them up high, high, very far. (40) And way up there a crow snapped up his eyes. (41) Yes, a crow there having snapped them up, poked his eyes [with his beak]! (Laughter).

(42) Then after a long time his neck got tired, from waiting for his eyes to go back in. (43) And his eyes were gone. (44) They didn't go back in, for a long, long time. (45) Now then he went away, "Ya···, woe is me," he said, "What can I do?" he said. (46) "I'm very, very thirsty," he said. (47) So then he went off guessing [his way] he went down the mountain.

(47) And he ran into something as he went—"What are you whom I've run into?" he said. (48) "You [have run into] me, a stump!" it said. (49) So it was thus again, again further on he ran into [something]. (50) And he said, "What are you whom I've run into?" he said. (51) And it said, "Into me, a tree," it said. (52) And he went on there—it sounded good. (53) "Maybe I'll find water," thus, he went. (54) "I am awfully thirsty." (55) And he ran into thick bushes like that, it was snowbrush they say. (56) And he said, "What are you?" (57) It said, "You have run into me, snowbrush." (58) And he tangled up in the brush. (59) And he said thus, "ʔŏ···," he said. (60) He went on. (61) He did not like it.

[64] The interjection /ʔa̲···/ is made with an ingressive air stream. Otherwise it is approximately the quality of [a·].

539*

(62) "So water may still be far away," he thought as he went along. (63) And again further on—again he stumbled into something bushy. (64) And he said, "What have I run into?" (65) "Into me, a saugus-berry bush," it said. (66) "Into me, saugus-berry bushes," it said. (67) So he went on. (68) "It sounds good over there," he said, so he went far over there. (69) "I am awfully thirsty."

(70) Now again he ran into some little thing. (71) And he said, "What are you, whom I've run into?" (72) And it said, "You've run into me, a cottonwood." (73) "Yes, yes—ya···, now it's as if water is near," now he said whispering, because water now was nearby. (74) So he went on again. (75) Now then something over there thus, he ran into something bushy, "Now what are you whom I've run into again? (76) What are you whom I've run into?" (77) "Into me, willows," that's what it said. (78) "ˀahhh," he said, "ya···, now water must be nearby," he said. (79) He went on, quickly having gone around it.

(80) Now then sure enough he went down, to a little river like this. (81) It [was] a big one flowing, a big drinking place, for everything—deer, everything drank there. (82) "ˀe···," he said, drank, very much, himself sitting in the water. (83) He drank very, very much.

(84) Now then Antelope came. (85) Antelope came there to drink. (86) "Why are you doing this way?" (87) "Look at me! (88) Look into my eyes!" he said, "My eyes are not good," that Coyote said. (89) "Bend down your head close and look at me!" he said. (90) Now then that way, he looked at him. (91) Then he grabbed them, both eyes, that Coyote. (92) He plucked out Antelope's eyes. (93) Having plucked them out, he pushed them into his own [sockets]. (94) Now he ran off, having done thus.

(95) Now then he [i.e., Antelope] did not go anywhere, he stood right there, waiting, he knew somebody would come there again. (96) Now then he—who?—that Gmok̓amč—he travelled everywhere there, being that kind, because he knew. (97) And he said, "How did this happen to you?" he said. (98) And he said, "Why it was this one, old Coyote," he said. "Old Coyote, yes, old Coyote did this to me. (99) And he plucked out my eyes." (100) "Yes," he said. (101) "Help me!" said he. (102) "Help me, make some eyes again for me!"

(103) "Yes," he said. (104) And sitting down there, in that little stream, taking up some kinds of earth, very good that kind. (105) Then he made them this way, very, very good he made them, little ones. (106) Then rather he put that kind [of earth] over them, which sparkles, shining nicely.

(107) And he said, "These will be your eyes forever, and no one will take them away from you. (108) And you will see this way too, [and] behind, having eyes which stick out far," he said. (109) "Yes, you will even see behind you, although you look straight [ahead]," he said. (110) "That much good I give you," he said now. (111) And he was very, very happy. (112) Now he said crying, "No one has ever helped me so much," he said, "You are a very good man," he said, it being Gmokamč. (113) And that's as far as I tell.

14. The Eagles at Sohi·yagye·ks

(Mr. Robert David)

(1) I will tell something, [about] the Eagle, who lived—where they call "Sohi·yagye·ks." (2) I will tell about that place [lit. "there"], there he lived, on that mountain, on the other side of Sohi·yagye·ks. (3) Yes, on the other side of Sohi·yagye·ks, on that mountain, which projects out. (4) And it is the highest part there, that one mountain, which sticks out. (5) There it goes very, very high. (6) And that rock is always visible here, lying on top.

(7) And there that Eagle lived. (8) He had three children. (9) And one was small. (10) They never gave him anything to eat, when they killed things. (11) Out in the water they killed, various things, flying around, they now being grown—the children of the little old man [i.e., the father Eagle]. (12) Now then they always teased him [i.e., the littlest] thus, "This one has moulted!" they said. (13) "He has no feathers—being small yet." (14) They said, "This one has moulted," thus they said. (15) And they teased him always, they, those two big ones, the children of the big old man. (16) And they always did thus.

(17) And he thought, "I wish I could do something!" he thought, that little one. (18) "I wish I could do that way, like they do—catching something, and killing something going along," thus he said. (19) And the father said, "I will teach you. (20) I will teach you, how they do. (21) However, you are still very small. (22) You cannot fly as much as they fly." (23) And that father said, "When you get [your] feathers, I'll teach you then," he said, thus he told that little one, his child. (24) "And they will not tease you, if you know how," he said. (25) "And you will do it that same way, you won't miss," he said. (26) "The first time I'll tell you [how]," he said.

(27) Now then after a long time, now it [was] a long time. (28) Now indeed he got feathers too, that little one. (29) But they had become big, wandering always. (30) They were two besides him. (31) And they having become big, that little one now got [his] feathers. (32) And he said, "Now do you want to learn?" said that father, that old man. (33) And he said, "Yes," he said, "Now I know how to fly. (34) Now I fly around strongly, just around here," he said. (35) "Now I am learning," he said. (36) And he said, "Yes," he said, "I will show you."

(37) And from there he saw, looking across, there, a swan like that, a big swan. (38) He was going there in the water, far out in the water, way out in the water there. (39) And he said, "That is a male swan. (40) Having a black head, this big. (41) You will catch him," he said, "You will not miss," thus he told him. (42) "Now you will learn how you will do. (43) Having turned down you will go, this way, not moving your feathers very much, when you will arrive close by there. (44) Suddenly you will just drop down," he said. (45) "Now you will go down, and you will strike him! (46) You will strike him in the water there! (47) And you will bring him back. (48) And I will give you this much strength," he said. (49) "But I will watch you," he said, the old man. (50) Now then he did that way. (51) Now he watched, he. (52) Now he ordered him, "Go now!"

(53) Now then he flew off this way high, having flown high up there. (54) And now he was close enough there, now he dropped down, suddenly! (55) And he struck him whom [his father] had pointed out, that male swan. (56) Now he struck him. (57) Now he slew him. (58) And he carried him back now, now he carried him back, flying back carrying him. (59) Now he carried him home for his father. (60) And he said, "Yes, now you will become a killer! (61) Now they will not tease you, you will become more of a killer than they, both of them," he said now. (62) And they became sad from that, that he had beaten them. (63) He was everywhere, now he killed just anything, that littlest young one. (64) And they were sad again, they. (65) From that they both became sad.

(66) Now then that old man died, that one. (67) Now he was the very same kind, he brought back even very large things like that, anything at all, many —even there he killed, whatever it might be. (68) The youngest one. (69) And he became very, very big. (70) Now he was large, more than his father, larger. (71) But they were not so big, those first two. (72) This one was the littlest, and he became very, very big. (73) And he always sat on top there, from there he watched always, where that rock was, now being big, now that his father was gone. (74) And now he was the next one to live there. (75) That is as far as I will tell.

15. The Pelicans and the Fish Hawk
(Mr. Robert David)

539x

(1) Once many of that kind of Pelicans lived here below, there, near the Lake. (2) And they always killed, they killed fish in that river, wandering, flying up and down that river. (3) And the Fish Hawk also, he always killed. (4) Now once they gathered together, as they were grouped on the bank, they, the Pelicans. (5) And the Fish Hawk came upon them.

(6) "But why are you sitting on the bank? (7) There are many fish. (8) I always kill many. (9) So why are you [plural] so lazy? (10) Instead you have many fleas, because you do that way. (11) You get fleas gathered together, gathered together closely. (12) You [pl.] scratch your fleas," said that Fish Hawk.

(13) And they said, "Yes, yes," they said, "We are very hungry," they said. (14) "Why don't you give us [something]?"

(15) "Why? Do you [pl.] know with what difficulty I get [my prey] diving down? (16) But you [pl.] are lazy. (17) Should I give it to you?" he said. (18) "You [pl.] are always lazy. (19) Because of your [pl.] being that way, you are hungry," he said thus to the Pelicans. (20) "But I always thus—catch only the good ones," he said, "Which are about to become nice, not rotten fish, as you [pl.] eat," he said. (21) Thus he spoke to them.

(22) So they said, "Yes," they said, "How—Bring us something to eat which you have killed, a good one, we want to see it," they said.

(23) "I cannot give you anything," he said.

(24) And they [said], "Yes. Just as you would," those Pelicans said, many of those Pelicans. (25) So now they made a plan, now they flew back thus.

(26) "Yes, you [pl.] be hungry there," he said to them, "I won't kill for you [pl.], while you [pl.] are gathered there, picking those fleas," he said. (27) "I get them with difficulty," he said, "Flying down from above, [*I*] seize them in the water," he said.

(28) And they said, "Yes. Yes, later on," they said, "But later on we will die from hunger," they said, thus said those Pelicans. (29) And now they plotted thus, "We won't allow [him]! (30) Some of you will be there! (31) And some of you stay there further on," they said, those Pelicans. (32) "And some of you go around further there!" (33) Every day," they said, "Every day, and he will not see anything," they said. (34) "All going close together, we will go downstream dipping the river [with our beaks]. (35) Whenever [any fish] comes to the surface, we will kill it, whatever floats up, we will kill it," they said. (36) "And the Fish Hawk will now fly around

[42] [re'i^{v}ebləčna] : /loĺeblanč́a/ "floated distributive round objects downstream," refers to the large fish-nets used by Klamath fishermen. Mr. David makes a simile here between the dipping beaks of the Pelicans and this type of fish-net.

above you [pl.], and he won't catch anything," said they, plotting now. (37) Now they did that way for a long, long time. 539#

(38) Now indeed that Fish Hawk flew down, looking very weak. (39) But those Pelicans had a great deal, every kind of thing, they had killed some good fish like that. (40) Those Pelicans went along dipping, they dipped beneath the water, and they caught even those moving on the top of the water [which] were good thus. (41) In that way they floated [their nets] downstream, as they call it. (42) And having done thus now, they ate it all.

(43) But now he [i.e., the Fish Hawk] was unable to catch anything. (44) They [i.e., the fish] were gone. (45) And flying down to them he said, "Yes," he said, "now I am hungry," he said, "I do not see anything. (46) I do not know what has happened," he said. (47) "No fish at all come to the surface. (48) I don't see anything—I fly up and down stream, fly up and down stream, every day. (49) But I don't see anything," he told them.

(50) "Yes," they said. (51) "You kill the good ones, but we [kill] the bad," said those Pelicans now. (52) "You eat the good ones! (53) But we will eat those that come floating, just as you told us," they said now. (54) Now they knew him, he was unable to catch [anything]. (55) Now that's the way it went.

(56) Now then that Fish Hawk said to them, "Pity me," he said, "Pity me! (57) Give me some," he said, "Don't do thus to me—you have done thus to me—I know it," he said. (58) "You have killed them all thus," he said, now he had watched them secretly, the Fish Hawk, flying around. (59) Now he had been watching them alone, what they were doing. (60) Now finally having come to them, he said, "You [pl.] have done thus," he said, "Now I know," he said. (61) "You [pl.] have done that way to me," he said, "But it is my [fault]," he said, "I did not do right to you [pl.] before," he said. (62) "So now perhaps [you pl.] have taken revenge upon me doing thus," he said. (63) "But I will never do thus to you any more," he said. (64) Thus he promised them. (65) "If you would leave me alone now—just leave me alone! —for now you [pl.] have beaten me! " thus he said.

(66) Now there were a great many Pelicans living thus. (67) Thus those Pelicans—whenever they would do anything—then they gathered together. (68) They gathered [when] they wanted very much to catch things like that, in the water. (69) Then they all got together. (70) Now then having done thus, they caught, they caught a great many even very good ones doing thus. (71) Thus it is, thus, it went at that time—long ago. (72) And there was a

famine for a long, long time, because of that, when those Pelicans thus gobbled them all up, the little fish. (73) And some fish did not grow because of that. (74) Now they caught all the little ones thus. (75) And they never caught them below here, fish, because people fished that way also long ago. (76) And it was told that way, a long time ago the story thus. (77) That's as much as I know.

16. Coyote and the Pelicans

(Mr. Robert David)

(1) I will tell what I heard [lit. "my hearing"] long ago, which these people related to us as a myth. (2) They spoke of everything long ago [or: "Everything talked long ago"?]. (3) And they told many things about that Coyote, he, he knew something, he knew how to win, he knew how to be clever. (4) And once he, because he wanted a woman, came there, to the east, not knowing, where Pelican was living with his wife [lit. "being married"].

(5) And he said, "I have come because I'm hungry. (6) Could you [pl.] give me a fish?" (7) "Yes," said that woman, and gave it to him. (8) And he said, "Yes," he said, "You have done me very well." (9) Now then that Coyote liked [her], now he liked that woman this way. (10) Now he wanted to fool around with her. (11) But that woman paid no attention to him. (12) Now then he was not dressed well at that time, so he came back later after awhile, to that same place. (13) Now he knew that woman, now he wanted her, Pelican's wife.

(14) So now in order to do something, now he came dressed nicely. (15) "ʔohhh," said that woman, "Who is this one coming?" (16) She did not recognize him, dressed up well. (17) And she said, "ʔohhh, this is somebody coming!" (18) Alone thus she said to herself, Pelican—that Pelican's wife. (19) So now then he came in there, standing up very well, having his head thrown back high, he entered. (20) "Ohhh, is it you?" she said now, looking him in the face. (21) "It is you who have come." (22) And he said, "Yes, I have come to see you," he said. (23) Now then he played around with the woman, rolling around on her lap now, having taken his hat off.

(24) Now then that husband having come home saw. (25) He saw him, what he was doing. (26) And he [said], "Who is this—even doing this?" he

said. (27) And that woman said, "But he keeps on coming around here," she said, "even at my forbidding [it]," she said.

(28) "Yes," he said, "I'll have a look at him!" he said. (29) "He'll make a good quiver," he said. (30) So now he had grabbed his nose, this— (31) "No! Don't make my nose bleed!" said that Coyote. (32) So he grabbed hold of his nose, and pulled it all off of him, his hide. (33) He pulled off all of his skin, all his tail too. (34) Now having done thus, he threw him out, Coyote, now having pulled off [his hide].

(35) Now then she took pity on him, that wife of Pelican's. (36) Then that Coyote said, lying there, "Throw out anything at all for me, I'll eat even that. (37) I'll get my fur back," he said. (38) Now then she did thus.

(39) Then came there—somebody it was—Gmoḱaḿč, perhaps Marten (one of them). (40) Now he arrived there. (41) And he said, "How did this happen to you?" (42) And he said, "He did thus to me," he said, "Help me!" thus said that Coyote. (43) So they were this kind—how do they call them? —(What do they call those cattails?)—cattails. (44) "Yes, he pulled off that kind. (45) "Now I pull off that kind. (46) Now they are dry, this way." (47) Dried, they are fuzzy. (48) And having pulled off that kind, he stuck them on, everywhere. (49) And because he did thus with that kind, [he] had fur. (50) It was not good. (51) They do not buy it, very much, that fur. (52) Now then he went away, having done thus now. (53) Now he never came any more. (54) Now he is gone forever. (55) Now he made a tail of the same kind, big, now telling him thus, "I am helping you. (56) Now I am helping you, taking pity, even though you are not worth helping," said he.

(57) Now then that little Coyote liked it, yes. (58) Even though he had done everything, little Coyote, again there, he did something, he did something not good. (59) Wandering in the same way he fooled them [at] everything, sometimes changing into something, becoming different [things]. (60) And he stole things from them also. (61) In that way that little Coyote lived long ago, going around from place to place everywhere that people lived. (62) This much I have told, as far as it [goes].

#539

17. Ģalo·qa·qaqs

(Mr. Robert David)

(1) čoy be·n ni dwa· s?abwapk, kant ni s?aywakta. (2) dada·t honk hok wawća·k ćasgi·ps dola či·ya·, čoy homas hoksakdanga honkt, kant ni nen s?abwapk, honkt ģalo·qa·qaqsas. (6) ģalo·qa·qaqsas da·ts honk, honk gist siso·ga, hokt ģapģaģwaće·sis hok—na?as no· domna.[43]

---

[124]

[43] Mr. David had just listened to the investigator reading Mr. Pompey's text about Ģalo·qa·qaqs (Text 7), and this reminded him of the present episode. In Mr. Pompey's story Ģalo·qa·qaqs fought Weasel, but Mr. David had heard some other version in which Ģalo·qa·qaqs fights with Ģapga ģwaće·sis. This is why he adds /na?as no· domna./ "Thus I heard."

Introductory Note to Text 17

This text and the four following it are not myths in the strict sense of the term. They have reference to myth incidents, or contain material relating to "supernatural beings," either as descriptions of these beings and their role in Klamath culture, or as narrations of actual encounters with these beings.

This text, "Q̣alo·qa·qaqs," was given by Mr. David after being reminded of this myth character by Mr. Pompey's story of "Old Mink and Nighthawk" (Text 7). It begins with a brief summary of the mythic incident which explains the phenomenon of lightning. Then since this reminded Mr. David of various Klamath beliefs and practices concerning lightning, he added these on.

The following text, "Gmok̓am̓č and Old Mink," contains a description of these beings, brief summaries of some of their doings, and some final remarks on their role in aiding and teaching the human beings of mythic times.

The next two texts, "Sqamdi" and "The Gaga·ńa," are current in Klamath tradition as actual experiences with these supernatural beings.

The final text in this section begins likewise with an encounter between humans of the mythical age and a powerful being, in this case a grizzly bear. Mr. David explained that this was no ordinary bear, since, like all other things in the myth age, she had the power of speech. Like the humans of that period too, the bear gained her extra strength by going to bathe at a certain hidden spring, a common form of the "power quest." This episode is then expanded into a general statement of Klamath ethics in regard to crimes of violence and the seeking of revenge.

17. Q̣alo·qa·qaqs

(Mr. Robert David)

(1) So I will again tell something, which I know. (2) When those dogs lived with Nighthawk, then he made them attack each other thus, which I will tell, that Q̣alo·qa·qaqs. (3) And I have heard it a long time ago, although I do not recall it well. (4) Then they made them attack each other. I do not recall which one it was. (6) Q̣alo·qa·qaqs however, he fought, that Q̣apg̣ag̣wad̓e·sis—thus I heard it.

*539 (7) ġapġaġwače·sis honk siso·ga ġalo·qa·qaqsas. (8) čoy honk ʔat sičwallqća, siso·ga mat. (9) ʔat sa siso·ga, ma···ns. (10) ġaḱi·ća sa honk, ʔa·yʔaýa sas honk, hok sat ġe·lant gyank. ---

[124] [44] The reference and exact translation of this sentence seem doubtful. This text unfortunately could not be checked over with Mr. David, and other informants were unable to supply a completely satisfactory translation. Mrs. Ohles felt that Mr. David had here injected a brief reference to the dreams in which spirit-power appeared.

(7) Çapgagwaće·sis fought Çalo·qa·qaqs. (8) Now then they rose up with each other, as they fought. (9) Now they fought, for a long, long time. (10) They went around and around, [and] they watched them, they [i.e., Nighthawk, Old Marten, etc.] being on the ground. (11) Then in that way they rose up [into the sky], where they went up with each other. (12) Up they [went], there. (13) That is the roar heard, Çalo·qa·qaqs'. (14) He rose roaring very violently.

(15) Then he said, that Gmoḱaḿč, thus, "Don't come back down! (16) There you will be forever!" he said to Çalo·qa·qaqs. (17) "Don't come back down! (18) And only that much will you threaten the myth-humans," he said. (19) "Only thus will you keep doing, whenever it gets cloudy," he said, "And only thus will you growl strongly, living there, living up there high," said that Gmoḱaḿč. (19) He told him.

(20) And it is thus now. (21) He threatens us sometimes, the thunder. (22) Thus some fear thunder. (23) People feared it, some, thunder long ago. (24) Long ago when it thundered thus, someone would have a vision. (25) Being small, so if he would have a vision, a hide sounding [flapping?] a deer's, a dried hide. (?) (26) So he went that way, wherever the thunder sounded thus. (27) And he feared very, very much.

(28) And [they] always commanded thus, "Run toward the water, if it does that." (29) [They] said, "Get down there in the water, and put something on here, something, charcoal is very useful, coals from the fire like that, which are completely burned black. (30) And they wanted [us] to put it [i.e., the charcoal] on top, sitting in the water.

(31) So I saw once, one woman doing that, long ago—in the recent long ago, that I know of. (32) When it thundered thus, then she was very much afraid. (33) So she ran down there from our house, toward Dokwa. (34) And having run into the water thus, she sat for a long time, in the water. (35) Thus they told [us]. (36) "Nothing can hit [you] in the water," thus they said. (37) So I have told this short bit [lit. "this much short"] which I know.

[124]

[69] Mr. David here refers to Text 38, which was told to the investigator some days before the present one.

539*

16. Gmoḱaḿč and Old Mink

(Mr. Robert David)

(1) People were the same some time ago—long ago. (2) It is told that there were people around here like those knowing [something]. (3) They knew how to travel [around], as I related to you recently, building a dam here—whom I told you awhile ago building a dam. (4) Recently I told you about it, they built a dam for the trout to kill them. (5) And it was that kind of person who wandered around here long ago. (6) How many?—three?—four? (7) Several having different names. (8) However, Gmoḱaḿč was the strongest.

(9) And I will tell about one, there, where I have told [before], on this side of Ni·Laqs there. (10) On the far side of Sohi·yagye·ks, where that lake is. (11) That is a big lake, which [you] see on going that way. (12) And there the people lived, on the end of that lake. (13) And they never ate fish, fish like these. (14) Indeed he came there, one, knowing something like that. (15) And he said, "I will build [something] for you [pl.]. (16) I will build [something] for you [pl.], where you [pl.] will eat fish." (17) And he did thus. (18) And having picked up a rattlesnake like that, he cut it into pieces. (19) He cut it into small pieces. (20) And he threw it into the water there. (21) And he said, "This will become fish," he said. (22) Every spring you will see them," he said. (23) "Now you [pl.] will eat fish! (24) It will become fish, suckers like that. (25) It will turn into suckers," he said.

(26) Now then they were happy, living there, there on this side of Ni·Laqs. (27) They lived there, on this side of Ni·Laqs. (28) And they were glad thus, "Yes," they said, "Very well you [have done] us."

(29) So he stepped on a rock like that. (30) And he stepped in it [as if it were mushy], without shoes, putting his foot down this way. (31) "This is my print. (32) As long as this print shall last, so long shall fish be here," he said. (33) He stepped on that rock, by the edge of the lake, near that water. (34) Thus he told the people, them. (35) [I] wonder if it is still in the same place? (36) It lay in the rock. (37) I saw it just like that some time back. (38) This sort of footprint, like the track of a man, big, in the rock this way, having stepped in it. (39) I saw it, some time ago, I myself also.

(40) "As long as this my foot [print] will be, so they will come, the fish," he said. (41) "They will come to the edge of this lake here.

---

[124] [44] Mr. David here gestured up at the roof, indicating the position of the smoke-holes. This is the reference of /gidaí/ "through here."

(42) And now you [pl.] will eat, having killed [them]." (43) Thus he told them, long ago, the man knowing how [to do] things of that sort.

(44) And there also lay a big sweathouse, belonging to people like that [lit. "that kind's"]. (45) And he made it for them, he, the sweathouse, there near the mountain. (46) It was large. I saw it sometime ago, long ago. (47) And there they used to sweat themselves, even many having gone inside. (48) I saw it, much, much bigger than this house, bigger, that sweathouse. (49) And there was a hole through here, a little one [i.e., a smokehole]. (50) And having put stones there in the center, those stones became [stuck together?] hard, big stones. (51) Those stones were large. (52) They built fires there. (53) And that is the ruins of their sweathouse long ago. (54) The one from there used to sweat himself, that kind made it for them, knowing how.

(55) And one of that kind also lies, there on this side of Fort Klamath, near the mountain. (56) I have seen it, also. (57) A sweathouse of just that kind, very, very well made. (58) However, I do not know who—whether those big persons, or perhaps anybody at all sweated themselves in it there. (59) And water flowed up [i.e., a spring] here nearby, near that sweathouse. (60) And they would bathe well, having sweated themselves, since he had made that water for them, that little river, [though] now that little river has become large. (62) And I have related these [stories], that's why I'm telling them that the ones who know used to wander around here long ago. (?)

(63) If anyone were sick, then he would make him better, laying hands on him in this fashion, and speaking. (64) "[I] want [you] to get well," he said, even being very weak, who was even about to die. (65) And he rubbed him thus, saying, "You will not be [thus]! (66) Now I will help you." (67) He pulled him back up, taking him by the hands. (68) He pulled him back up taking his hands thus, that man, because he knew how.

(69) He did anything thus, helping, anything at all—whatever happened to someone, whether he was ill thus, or whether he was somewhat poor. (70) And he helped them saying, "I will help you," he said, he told [them]. (71) So it would be thus, just as I have related to you. (72) "And you follow it [his rule?]," thus he told them, "and [I] will help you."

(73) So it was that sort who went among us here long ago. (74) That kind—he was a person [Indian?] like that. (75) He was an Indian [person?], nothing else. (76) Not having come from anyplace else, but just from

right here. (77) However, I do not know who they were. (78) I don't know their names. (79) Only it was Gmoḱaṁč and Old Marten, they knew how [to do things] long ago. (80) Gmoḱaṁč, Old Marten, and one more also. (81) I can't think of him. (82) They lived here, on this side, the ones who knew how like that, many [of them]. (83) It is as I have told it, a little of what I know.

19. Sqamdi

(Mr. Robert David)

(1) I wish to tell again, [about] our own region here, right here, where it flows, the river, towards the Marsh. (2) And a little ways up here, we people have called "Sqamdi." (3) And there the river is very, very deep, very far across. (4) And it is this way always, as if it did not flow, as if it were always in one place, always. (5) Very, very far, in descent, the cliff there being high thus, and having looked down [you] see it, Sqamdi.

(6) Now then many have seen him there. (7) From there, once a Pit River [Indian] having come, he lived here thus, a foreign Indian. (8) He wanted [someone] to show him where it [was]. (9) So [those] from here told [him] thus, "It appears there, if you, a foreigner, should come." (10) [They] told him [that it was] there, named Sqamdi. (11) And he said, "Yes, why I would see it, if [you] can show me Sqamdiwa·s yet, [and if] he would come up [to the surface of the water]. (12) So I would see him," he said.

(13) So he went off once, in the evening, before sunset. (14) He carried his gun. (15) "I'll kill him," he said, said that Indian. (16) "I'll kill him, that Sqamdi-dweller, whatever he might be. (17) He whom you [pl.] are proud of, I'll kill him!" he said, that mischievous one, the Indian who had come from over there.

(18) So he went off, once now at evening-time, before the sunset. (19) And he arrived way over there, having gone by horse. (20) He went from here by horse. (21) One forbade him thus, "Don't! Don't do thus!" he said, "We have told the truth!" (22) "ʔahhh, I will see—I want to see. (23) I have travelled around everywhere," said that Indian, "I've travelled around everywhere, and I've always gotten out [all right] what-

naʔas honk hokt, solwetgok maqlaqs sʔaba·. (24) "ʔi·, gen hay do·!" či honk, "ʔat dak min san sʔabi·ya, kant ni sʔaywakta," naʔas honk hokt.

539*

ever [it was]," he said, that Indian braggingly said. (24) "Yes, go on then!" he said. "But now I have told you, that which I know," said he.

(25) So now then he did thus. (26) Now having gotten there he looked down off [the cliff], [and] standing said, "Sqamdi-dweller having come up, show yourself to me!" thus he called out, looking down over there. (27) Now indeed an otter swam across, an otter like that. (28) It swam across to the other side. (29) So he fired at it with his gun. (30) But he did not kill it. (31) And again from that side one came swimming across, after awhile. (32) Now different kinds swam across. (33) White. (34) Red [ones] again swam away, came swimming from here. (35) And again even a black one. (36) He shot at them with his gun. (37) Now he had fired off all his bullets. (38) Very, very many now [were doing] thus, now that kind swam around. (39) Otters like that. (40) Now then thus in the middle [of the stream] very much—just as it—will foam white—the river became, as if it were boiling thus.

(41) Now something big wanted to come up out. (42) Then now that man was unable to look it in the face. (43) Now he fell over right there. (44) Having fallen over, he lay on the ground. (45) He did not know now that something big had almost come up out. (46) It all came up out, as though it were boiling. (47) The water became [thus]. (48) Now thus it kept on being this way. (49) That's all he saw now. (50) Now he fell down, lay on the ground, for a long time right there. (51) Now he could not see what was happening at all.

(52) Now he could not stand it, that man. (53) He was unable to look at it again, as he had told them, "I [can] look at anything." (54) So he was unable to see it. (55) Now it was thus. (56) Now he did not know anything that happened to him.

(57) Now they found him there, the night being long gone [or: "he being gone long at night"]. (58) People from there went, people from here went, from Chiloquin. (59) So now they tracked him there. (60) And they saw him, lying. (61) Now then having done thus, they brought him back on [a horse]. (62) They revived him thus, making him sit down.

(63) "How are you? (64) What did you see?" they said, they asked. (65) "I don't know," he said, "It did me bad," he said. (66) "My heart is weak," he told [them]. "My heart is weak," he said, "So I could not do thus," he said. (68) Now having fallen down, forever. (69) Now I [have told it] as far as [it goes].

20. The Gaga·ńa

(Mr. Robert David)

(1) I will tell you again about long ago, what I heard [lit. "my hearing"]. (2) Thus they related, the Paiutes always dug [roots] there, various things, there where they lived. (3) Far over there, the Paiutes dug, camas—perhaps?—many women. (4) And having put down their babies, having put them into the cradleboard, they put them down and left them. (5) They put them down. (6) Sometimes they leaned them against something, standing that cradleboard up against something like that.

(7) Now for a very, very long time they were digging. (8) And [one woman] said, "What's the matter with you, you have not gone back to see your baby?" (9) Said some of those women. (10) "Won't he be hungry?" (11) "Yes," she said, "I'll go back right away." (12) She said, "I'll give him to suck," she said, "I'll give him to suck, and then will come back again."

(13) Now then she gave him to suck, taking him up in her arms. (14) Now then he sucked, he. (15) Now he suckled for a very long time. (16) So then that woman wanted to make him let go [lit. "make him open-off his mouth"]. (17) Indeed, he did not let go—always he suckled here. (18) He kept his mouth on, always here, on the teat. (19) So now she thought, "What's the matter with him? (20) This is not my child," said she, that woman now. (21) "He is not like my child." (22) Now then she ran her hands over him, and he was hard.

(23) And she could not make him let go. (24) Now she could not make him let go. (25) So now she called to them saying, "Something [has got] me! (26) He can't let go of me," she said. (27) So they having run together, now those women looked. (28) His body was hard all over, [his] head too. (29) Everywhere he was hard. (30) And one said, "He is a Gaga·ńa," thus said one woman. (31) "A Gaga·ńa is suckling you, but he must have killed your baby," she said. (32) "He has killed your baby, it, perhaps, and he has laced himself on, that cradleboard. (33) That Gaga·ńa has gotten into the cradleboard. (34) He is that kind," she said.

(35) So she said to them, "How—cut it off of me!" (36) Now they cut off the breast of that woman, right here, on the end. (37) And having just done thus, that woman went away. (38) But she was unable

---

[124]
[776]
[47] Mr. David changed to English after finishing this text and related some further incidents about the Gaga·ńa. They were tiny people, he said, who dressed strangely and were sometimes naked. They lived out in the timber but were especially numerous around Summer Lake (/ʔiwws/). They were seen not only by the Klamaths but by other tribes and by white men as well. He described one such occurrence in his youth, when a white man driving a team of horses on "the mountain" (Crater Lake?) was stopped by a tiny little man who clung to the wheel of the wagon. All the strength of the horses was insufficient to move him. Mr. David mentioned a further occurrence in which a Paiute saw a group of Gaga·ńa playing in a meadow and thought they were children. When he tried to pick one up, he could not lift it, and its body was hard and rock-like.

[193]
[48] Mr. David did not know the exact location of /swaq̓a·delwas/. This word seems to contain (dʷl) 45-v "to look," (ew) 10sv "into the water, flat place," and the noun ending (s). The sequence /swaq̓a·/ is unanalyzable.

539*

to open its mouth, they poked [something] into its mouth, but they could not open its mouth, so tightly it had bitten together. (39) And they knew thus, it was a Gaga·ła thus. (40) And I heard this much thus.

21. The Bear

(Mr. Robert David)

(1) I will tell a little one again, that I know. (2) Indeed, I remember it a little. (3) I heard it long ago, there where the Marsh is there—[they] caught a little grizzly bear. (4) And the people brought it back this way, where Chiloquin is here. (5) And it was over there, as they have named Lobaqskai there, near the river. (6) Many, many people lived there, in summer houses, in every sort of thing. (7) People lived there long ago, even in winter. (8) And those people were from there. (9) Now then she knew, that Grizzly Bear, because she returned there when her little one was gone. (10) So now she came tracking their trail.

(11) Now it is told (?) being very, very sad, that Grizzly Bear, that woman. (12) And she said, "As if I [were] anybody they [did] this to me," she said, "Who have bathed even at Swaq́a·delwas," she said. (13) "For I have also bathed at Swaq́a·delwas," she said, "to gain spirit-power there," she said. (14) Thus she explained, "I have bathed there, in the water where it is difficult [to get to], nobody can reach there very well." (15) And thus she said, naming it, "I have bathed at Swaq́a·delwas," she said. (16) Now because she was angry she said thus.

(17) čoy honk gen gepga ʔat. (18) čoy sas honk git gatbno·ta. (19) čoy honk domi· maqlaqs naʔas, "ya···, ʔat ʔa do· ne· gepga!" (20) čoy sa honk ʔat ḿolẃa, na·nok nteya, dalč́itga na·nok dwa·. (46) čoy dwa·t kani waq gi, čoy q́ay sańa·Wawli Nayksĺant hay bas sq́aLtgi giwk, wag̣a·n hoḿas waq gitgi giwk. (47) ʔat hok č́osak hak genank saẃalg̣a. (48) waq gin gyank kat hok sʔaywaks dinkanks—ge·čik g̣e·lantga dinkanga, waqt hok sa·t č́is g̣e·lantga ho·t sa gida·na dinkanga do·—ʔiwakni·. (49) naʔas sa ʔelg̣a ʔiwakni·. (50) čoy hompči hok gi. (51) hoḿas hak čik honk ho·t loq gi, ʔat honk sʔaywakta dat gist. (52) sʔaywakta kańs gist, hoḿas gyank. (53) ʔat sas honk haYčipga hokt. (54) sʔaywaks hok haYčis loq hompča, gempča dwa· gin. (55) či ni nen sʔaba·.

(17) Now then she came. (18) And she came upon them here. (19) And so many people said, "Ya···, now that one's coming there!" (20) So now they got ready, all the bows, with arrows and everything. (21) And she said, "Yes, I too have bathed, at Swaq̓a·delwas," she said. (22) "Even though I had bathed at Swaq̓a·delwas, they played with me," she said. (23) Thus she said, the Grizzly Bear speaking.

(24) Now then she attacked them, now she killed some people, just going right in among them. (25) So they shot, they shot from over there. (26) For a long while she killed many people that way, that Grizzly Bear. (27) Now then, having done thus, now indeed after a long time they killed her, that Grizzly Bear. (28) Now they killed her, even after a long time. (29) Even though she had killed many people—very many she had killed. (30) So now then they killed her after a long time.

(31) So they kept that hide for a long while, showing it to people long ago, passing it from generation to generation long ago, to some who grew up later. (32) And they showed it to him next saying, "This is she, who attacked us here awhile ago." (33) And the people of long ago were that way.

(34) And when something happened, also when something not good happened [i.e., when some crime or mischief occurred]—so I will tell again, to one side, a little bit. (35) That, however, is good [i.e., his previous story]. (36) So these Indians lived that way among themselves long ago. (37) These Klamath people lived here. (38) And the Paiutes lived over there. (39) And those Warmsprings people lived over there. (40) And the Pit Rivers lived down there below. (41) And [should] they do anything of that sort, anybody kill someone's father, or perhaps some relative. (42) So then they now ran toward there right away. (43) Now they took revenge in that same way. (44) Just as I have related, just as that Grizzly Bear did, now they took revenge on these [people] having come. (45) That's how it happened long ago, in every direction.

(46) And if someone did something, then they did not want to be injured on one side, and perhaps [wanted] to do the same way. (47) Now always having gone, they took revenge. (48) Having done something even, who knew how to run around—indeed, they ran around this country, just as those Paiutes also ran around here there—at Summer Lake. (49) They called it "Summer Lake." (50) So they did the same way. (51) Indeed, that Grizzly Bear did the same thing, now she knew where they were. (52) She knew who it was, having done thus. (53) Now she tracked them. (54) That Grizzly Bear knew how to track that kind, any kind at all. (55) Thus I have told it.

PART TWO: ETHNOGRAPHIC TEXTS

Introductory Note to Text 22

"Wokas" is the generic term for the seed of the common pond lily (Nymphaea polysepala). In the old days much of the Klamath Marsh (estimated by some early writers at about 10,000 acres) was covered with these plants, and there were long, shallow bays filled with them on both sides of Klamath Lake. Much of Klamath economic life was concerned with the gathering, preparation, and cooking of this plant. 824 [133] [433]

It is not proposed here to give a complete description of the various processes involved in "wokas"-manufacture. Good explanations of this economic complex will be found in Coville,[69] Gatschet,[70] and Spier.[71] The following text (and the two shorter ones by Mrs. Pompey which come after it) are intended only to illustrate Klamath narrative style and to indicate those features of "wokas"-making which were salient in the view of the informants. 252 [114] [128]

22. Wokas Preparation

(Mrs. Aggie Butler) 539* 222

(1) Long ago the Indians used to gather wokas, with a canoe. (2) And standing up on it they gathered wokas. 501 (3) They bent down to pull them off, that wokas. (4) And they pulled off only the good ones, and some were unripe. (5) And having punctured it [with a fingernail] they saw [whether it was ripe or not]. (6) And they picked the yellow ones. (7) On becoming ripe it looks good, big. (8) And having picked those only, they threw them on the canoe and went. (9) And some were termed "snoníapíaqs." (10) And one was called "sbokẃas." (11) It was ripe. (12) And they put them down [in the canoe] apart.

[192]

---

[73] Mrs. Butler inserts /wage·nha/ "perhaps" here because there is an alternate method: instead of washing the wokas to rid it of the shells, one can completely dry it, crush the outer shells, and shake and winnow the seeds away from the chaff.

(13) And having returned there, having filled the canoe, so having unloaded it, it is in just one place. (14) And it stays piled up there for a long time. (15) So it becomes dry on top, and rots underneath. (16) And perhaps they washed it, and all that was not good would float up to the surface. (17) And only the wokas sank to the bottom. 539* [222]

(18) And they spread it out on a mat long ago. (19) And having spread it out there, so it dried out. (20) When it had dried, perhaps "three weeks"—(laughter)—three weeks having passed perhaps it has dried. [251]

(21) And next they sift it well, until it is dry. (22) They do it all well, and they put it into sacks now. (23) And to make food, they parched it. (24) And at that time long ago they used parching-mats. (25) And having put coals on there, they roasted it, that wokas.

(26) And having roasted it well, they ground it with a muller. (27) Sitting spraddle-legged they ground wokas. (28) And then having finished that, they dipped it all to one side. (29) And all the chaff came up, on top. (30) And having put it to one side, they ground it again. [516]

(31) And now they made food. (32) Long ago it was, before when our things, dishpans, were not there. (33) And at that time there they did it in a "čakía" [i.e., a type of basket], "čakía" as they termed it. (34) And in that they first heated rocks, and they put the wokas into water. (35) Then they threw the stones into the water, in that "qalla" [another basket type], to boil it at that time, a [modern] boiling-pot being absent. (36) Thus they made wokas long ago. [178] [415]

(37) And that second kind, which I called "sbokw̓as," they soured it apart. (38) And they took it off the top, while it was still wet. (39) Having gotten it ripe, they took it off the top. (40) And those were round, those—"sbokw̓as" were. (41) It was called "sbokw̓as." (42) And again having ground that "sbokw̓as," then again in just the same manner having put it in among coals next, they parched it. (43) Again they parched it. (44) They parched it, and it tasted good.

(45) And one other, that one being called "č̓ini·q̓am." (46) It was not ripe wokas, and it tasted bad. (47) It was bitter, and they thus made it round, having parched it. (48) That's as much as they said.

[124]
[194]

[73] In speaking to the investigator, Mrs. Pompey felt more at home in English, since at that time the investigator knew so little Klamath. She thus inserts /be·raldat/ "in the barrel." The phonemic structure is Klamath, except for the anomalous /r/, but ‖d̲‖ after ‖l‖ should occur as /l/, giving ‖be·ral d̲at‖ : */be·rallat/.

[74] The form /sa·war/ is English, but conforms to Klamath phonological pattern except for /r/. It might well have been put in quotation marks as a form quoted from another language.

[75] /sannat/ is likewise from English. Here, however, ‖sand̲at‖ : /sannat/ as it should.

23. Picking Wokas

(Mrs. Grover Pompey)

539*
222
251
415

(1) We gathered wokas on the Lake. (2) We picked it. (3) And we put it into gunny sacks, and we took it back, home. (4) And we threw it into a "barrel," to sour it. (5) Thus we fixed our wokas, just as they make it recently. (6) So then, however, it was not there for long [Informant's translation ?]. (7) And having brought it back, we put it into a "barrel." (8) And to become "sour." (9) To sour we put it into the "barrel." (10) So until it's well done it is that way. (11) Now then we dip it off, having dipped it off well thus, then something—we spread it out, in the "sun." (12) To get dry. (13) Now then we spread it back and forth, to dry out well. (14) Then we put it into our sacks. (15) And that's as far as it goes. (16) Now we make food, having dried it well. (17) So now we eat it.

24. Cooking Wokas

(Mrs. Grover Pompey)

539*
252

(1) [One] puts the wokas on a parching-mat. (2) [One] puts coals on top of the wokas. (3) Then shakes it while blowing on it. (4) [One] blows on the coals on it to cook one's shaken wokas [i.e., the wokas which one is shaking back and forth on the parching-mat].

---

[[24]] [76] Mr. David had just been speaking about the various culture-transformers in English and had recently finished telling Text 18. The subject of this entire first section is thus one (or more?) of these powerful beings.

[194] [77] The form /de·m/ "dam" is phonemically Klamath, but might have been put into quotation marks as a quoted item.

9: Barker L-5 (1955-1957) 1963

NR10 Klamath NR10

25. Grinding Seeds

(Mrs. Grover Pompey)

539# 252

(1) Having crushed the seeds, having gotten out [the kernels], [one] grinds [them]. (2) Having ground the seeds [and] having put them on to boil, [one] cooks [them]. (3) And [one] eats having done thus. (4) It tastes good.

26. Killing Fish

(Mr. Robert David)

539# 226

(1) Right down below here, below there, below Chiloquin he [i.e., Gmok̓am̓č] made it for the people long ago. (2) And there he said to them, "Here you will kill fish!"—those who lived down there, the people. (3) And he said to them, "As long as it is spring, in this month, so having gathered together now you will kill fish," he said, "Here I have dammed the water—will dam it right to the shore, this, in the river."

(4) Now he made something like that, of stone this way, just as they make a "dam" lately. (5) It is thus down there, all lying, visible even now.

(6) And people came there always now, every year. (7) And from there he [Gmok̓am̓č] made another near there, at Lobaqsksi, as they call it there. (8) Here above, Lobaqsksi. (9) "So you few live right here," he said, "And it will be thus, just so far will those fish swim," he said. (10) "Those kinds, fish, which I have told you [pl.] to kill, which you [pl.] eat, so far will they swim. (11) Not further. (12) They will not swim on further in the river. (13) Just so far," thus he told them now.

(14) And the people were thus here, I saw long ago, when I was small. (15) And now having moved [to this fishing spot]—[in] the spring—then they killed them. (16) They killed that kind, fish, all [kinds]. (17) And

[417]

(17) And they erected this kind of little pine trees—having taken off all the something—all the needles, having stripped off. (18) So then they hung them up there, those which they killed. (19) Fish of every sort whatsoever, even any trout they killed there at that time, when there were many trout. (20) And suckers the same way, in sucker-season, there where many, many suckers came. (21) And they crowded up against that, that which I told of [i.e., the dam], thus, that kind which he made for them thus. (22) That dam. (23) Now they crowded up against it. (24) And they killed them now at that sort of place. (25) And having made even various kinds of dippers, they killed them with that sort of thing also.

(26) And long ago people did not know these sorts of things, which they use nowadays. (27) However, [I] saw, how they did. (28) They killed very, very many—it looked red there, there they dried them, right there. (29) They dried all the fish. (30) So now having finished drying them, so now having done thus, they were something—they were stiff this way from drying. (31) They became stiff.

(32) Now then they pounded them all up in this way, having beaten them. (33) And then having done thus, they put them aside. (34) Now then they became soft. (35) It turned soft. (35) Then they gently pounded it flat, thus, with a rock, [or] with something else. (36) They pounded it all gently, and they put it down [in separate places], whoever got it. (37) If anyone had gotten a little, then they gave him some. (38) Thus were people long ago, not stingy. (39) They gave to each other, if someone were poor. (40) Then they gave [to him].

(41) And I saw it once, even a short time ago, when the soldiers lived at Fort Klamath, there. (42) And they having arrived there [at the fishing dam], they helped the Indians now. (43) They brought a huge fishnet of that sort. (44) A big one. (45) I saw it. (46) And the soldiers waded way out, there they waded around it, right up close to that [dam]. (47) And they after a long time thus, wanted to gather it all up, all that net. (48) Now a great many indeed had grasped it, [for] it wanted to go off [i.e., its weight and the current pulled it down river]. (49) And they having hitched on mules, having hitched on four mules, now with much difficulty they dragged it out for the Indians. (50) They killed very, very many. (51) Thus I saw once, long ago.

(52) And all the Indians got [some], they divided it up among themselves thus. (53) They piled up much, right there, all. (54) And they, the soldiers, did thus. (55) I too saw it once. (56) It was a good sight.

(57) Everything, trout mixed in, even trout were mixed in that. (58) Once they drew it out that way. (59) So the Indians' food was good.

(60) And he had told them that long ago, someone—perhaps Gmoḱamč—to do thus. (61) Gmoḱamč helped the Indians. (62) It was never like that long ago, only the river flowed, they say. (63) And they were weak. (64) They were unable to kill fish. (65) And because they were thus, he told them thus, "I will make [something] for you [pl.], where you will kill [fish] every spring." (66) Thus he them, Gmoḱamč told, long ago. (67) [That] is as I know it, that much.

Introductory Note to Text 27

539*
648

In this text Mrs. Butler describes two incidents dealing with the cruelty of the early white settlers. Various renditions of these stories were also obtained from other informants. The first incident concerns a party of white men, led by a now-famous local figure, who came upon a party of Klamath women picking wokas, and wantonly shot one of them in the face. According to Mrs. Butler, the woman lived, and the scar still showed years later. The second occurrence concerns a group of Rogue River Indians (?) who were hired by a settler to dig a deep trench. Once the trench was dug, the settler and his men opened fire on the Indians and threw their bodies into this ready-made grave. According to Mrs. Butler's text, this incident was one of the sparks which led to the Modoc War. The names of these white men have been omitted from the text for obvious reasons.

539*
567

The informant also describes the customs of "raiding" and "slavery," as practiced by the Indians of Southern Oregon. She points out that this was a far different thing from the concept of slavery as found in Rome or ancient Egypt or Asia. Many of the children, originally stolen in childhood, grew up among their captors and received good treatment, eventually coming to love their new home more than the old.

27. Some Historical Incidents
(Mrs. Aggie Butler)

(1) Now I will tell, something, a little to you [pl.]. (2) We Indians lived in the distant past, and we lived correctly [lit. "well"], not doing anything [bad]. (3) And there were many of us Klamath Indians living everywhere, all along the shores of the Lake.

539*
173
648

(4) And once the white men attacked us old ladies gathering wokas. (5) And they almost killed there, shot some. (6) And he was among them—(Proper name)—he, [of] whom the white people are so very proud. (7) He was there with them. (8) And [he?] shot one of the women, in the face, and it showed.

(9) And some did not hide from them, and they left them alone in their winter-houses, living. (10) And the Indians, those Klamath men, were away hunting for some time, and on their returning [the women] told them. (11) And the women [told] them what the white people had done to them, and they almost tracked them, but they did not do anything again, to that white man.

(12) And then the Warmsprings people always used to quarrel with them, and having come, they made slaves, of the Klamaths. (13) And the Klamaths having tracked them, killed some, having taken the women back. (14) So thus the people of the old days always fought wars here. (15) And they [did] the very same way to the Pit River Indians, having gone, the Klamaths, and they enslaved their children too. (16) They raised them, however. (17) And some never went away from them, [for] they loved some of them. (18) They did the same thing to the Paiutes. (19) And they made slaves of the Paiutes also, and they grew up right there, so they live there today, those Paiutes who used to be slaves there.

[726]
[567]

(20) And the white people did evil to the Indians, and once that one called (Proper name), to the Rogue River Indians. (21) And that white man wanted all of them to dig, on his land. (22) And having dug something, then he killed some of them there, and threw them down into that ditch. (23) And he covered them [with] earth, the children too. (24) And one who escaped told of it. (25) And because of being thus at that time, when the Modocs made war [i.e., the Modoc War], then one of the chiefs spoke thus, "Let them not do it to us, as that (Proper name) [did] to the Pit River Indians awhile ago! (26) Perhaps they want to do the same to us. (27) They want to 'speak' to us Modocs in the same fashion."

that Modoc said once. (28) They never forgot it, [their] doing thus, [their] killing the Indians wrongfully [lit. "badly"]. 539* 173

(29) And I have only related little bits of it. (30) But I know a great deal, but I am not telling all of it, however. (31)—How the Indians used to fight amongst themselves, always they fought even among themselves. (32) Even among themselves they enslaved someone's child, and sold it. (33) That much is all I will tell. (34) I have nothing else to tell. 648 [721] [567]

Introductory Note to Text 28

This text is a continuation of the foregoing by Mrs. Butler's sister. Both are part of a recorded conversation about Klamath history in general, and no particular attempt was made to formalize the texts into "stories." When Mrs. Butler had finished her historical narrative above, the topic turned to the Modoc War, and Miss Skellock began to discuss their father's role in that conflict. Rightfully, this text should include the remarks in English which led up to the Klamath portion, and also an explanation and continuation in English which follows it. Limitations of space require that these English parts be edited and abbreviated, however. 124 128

Introductory Remarks in English

"Our father was a scout in the Modoc War. He was with the white soldiers and went to those Lava Beds where the Modocs were." 539* 726 648 173

28. Recollection of the Modoc War

(Miss Irene Skellock)

(1) My father went there, to the battleground. (2) And he was with the white men. (3) And he was a soldier—ah—a "scout." (4) And they were falling on both sides of him, soldiers. (5) And if they shot one, the soldier behind him marched up to the front. (6) However, they never shot him. (7) And he, however, was afraid of seeing (?) those Modoc Indians only. (8) So he lived in fear, thus they said, and some of those Klamath Indians who went with him, they also were afraid. (9) And that's all I'm going to tell [in Klamath].

[TEXT CONTINUED ON PAGE 143]

(1) blaydaĺgi·sam newĺaqstga. (2) ge·la sonde·wapk na·nok. (3) čoy dada·t hok be·n gatbanwapk blaydaĺkni·.

Concluding Remarks in English

"He said that whenever someone was killed in front of them they had 539*
to jump into their place. Oh, he said he sure was scared! He was with 726
those white soldiers fighting the Modocs in the Lava Beds." 648

Mrs. Butler adds: "He told how they had to go to the war, because 173
they (the white people) told them that they'd take all the Klamath Indians away, if they didn't go. All those who went were related, since they didn't want them to take anybody away. Others, some of them, refused and took their canoes across to Pelican Bay. Some did not want to get into the war. One man, a good shot, said, 'I'm not going. I'm going to die! They can kill me right here. I don't want to go.' But they never took him."

29. Menstruation Practices

(Mrs. Pansy Ohles)

539*
841

(1) When a woman has her menstrual period, she does not come to eat because of menstruation. (2) [She] does not eat with us. (3) [She] does not bathe, does not get wet. (4) [She] will not get chilled. (5) [She] does not feel well, and does not put her hand in water.

30. The Second Coming

(Mrs. Pansy Ohles)

539*
776
787

(1) According to God's promise [lit. "rule"]. (2) All the earth will burn up. (3) And at that time God will return again.

[20] The sequence /čiW čiW!/ represents the sound of the meteor (meteors?) falling into the water. There is only a trace of voicing to the /i/ phonemes here, and the /W/ is prolonged.

31. A Meteor

(Mrs. Pansy Ohles)

(1) The stars fell like rain. (2) And they covered me with a mat. (3) And on falling into the water [they made a sound] "čiW čiW"! (4) And I peeked out from under. (5) And I was very much afraid. 539* 821

32. A Funeral

(Miss Irene Skellock)

(1) When a person died, long ago they used to cremate him. (2) But recently they have not done thus, when I was small. (3) And there where we lived, nearby a woman died. (4) And they gave things to each other. (5) They gave to us—a dishpan, a washpan. (6) And one man said, "Whatever they will give you [pl.], you [pl.] must give back likewise." (7) And we—did nothing—[did] not have any use for it. (8) However, we brought it back for him, the very same kind, just as they had given to us. 539* 764 [178]

(9) Then we went there. (10) And we put flowers on for [the deceased?]. (11) And we went there—Sidaykedi. (12) And we slept on the ground, having arrived there. (13) Then those people sang all night. (14) But we did not understand anything of what they did. (15) We only heard them, they beat a drum. (16) And they [sang] thus, "?i···!" (17) Only that we heard there.

(18) Then early the next morning they took [the corpse] off to bury it. (19) And having arrived there, [at] the graveyard, then all the people took up a handful of earth. (20) And they having picked it up, they marched [past the grave], and threw it down into it. (21) And on finishing, then they now put all sorts of things on top [of the coffin]. (22) They put plates on, knives, spoons, forks. (23) And now having finished doing thus, then we went back down [the hill] to eat. (24) And now everyone went home. (25) The next morning everyone returned home, to Chiloquin.

33. A Childhood Incident
(Mrs. Pansy Ohles)

(1) When I was small, I always wanted to whirl around. (2) So I whirled around. (3) Then my mother said, "Don't do that! (4) You will get hurt!" (5) Then I whirled around, not minding. (6) So I then fell upon my stomach on a sharp place like this here. (7) Now I got hurt. (8) Then she spanked me with a piece of wood. 539* 861

34. Marriage Customs
(Mr. Robert David)

(1) I do not know it awfully well. (2) It was such a long time ago. (3) However, I heard thus, [that] these people long ago, when they liked each other thus, then they told their mother and their father too thus, "I want that girl," that man said. (4) "I want that woman." (5) And they asked, "Does she, then, want you? (6) Does she then want you, that girl?" they asked that man about that woman, his parents. (7) And he said, "Yes, she wants me," he said. (8) "Yes," they said, "Let us get ready." (9) They said, "We will get ready, and on this day we will gather together. (10) Now [you] will get her," they said. 539* 584

(11) Now then they came [the groom and his parents are denoted by the verb]. (12) That man's people from this side will come—all the relatives. (13) And those from that side will do the same thing, her fathers [i.e., parents?], whatever they might be, the same sort of relatives of the girl. (14) And now they give [gifts] to each other the same way. (15) And those from that side give [gifts] to the groom. (16) All sorts of things that they have, even very valuable [things], they even did thus with horses long ago. (17) They used to give each other even many horses, if they had horses. (18) These horses have been here for a long time, among the Indians. (19) And they did thus, at that time. [431])

(20) Then when they had finished doing thus, now being pleased they did thus—now they made it tight [i.e., concluded the marriage agreement], having done thus. (21) On both sides they told [the couple], "Live as long as you will live, together. (22) You will be one now," they said. (23) Now they said, "Even however difficult [it might be], you will always 539* 585 581

live together with that man of yours," they said. (24) "You will never 539*
leave him. (25) You will never deceive him. (26) You will give him
everything. (27) You will hide nothing [from him]." (28) Thus they told 585
them. (29) "Everything of yours [pl.] will be just one. (30) Now you 581
will tell each other [everything]. (31) Anything at all—if someone would
tell you, something, then you would tell your husband. (32) If [someone]
would tell you, the husband, also, then you will tell your wife. (33) Now
you [pl.] will be just one. (34) Then having become just one, then you
will tell your [pl.] children in the same way, to do just thus, just as we
live," said that old man, speaking, who was their father, his [hers?].

(35) "So now you [pl.] will become just one. (36) We are this many living. (37) And thus having begotten children, then you will advise [them], just as we are telling you today. (38) And you must never, never forget it!" they said. (39) "If you indeed would forget it, something evil will take hold of you forever. (40) And it will always be thus. (41) Now you will hide something from him next, even something big, which you did wrongly—perhaps [something you] did. (42) If you do thus," they said, "Then something you do not want, evil, to be thus, to fall between [you] thus, then it will catch you. (43) Where we live, so you will live, being happy. (44) And so far, when we are old now. (45) So you will live together until old age with that wife of yours." (46) Thus they told them. (47) Now that's as far [as it goes].

Introductory Note to Text 35

This is the Klamath version of "This Little Piggy Went to Market." 539*
Mrs. Chiles felt that it, or something very similar, had been used since 854
pre-White days, but she was not sure about the details. Several of the [124]
items are untranslatable in terms of this corpus, and one, No. (6), seems
to contain myth material. Mrs. Chiles thought that there definitely was a
myth connected with this but could not recall it in any detail and did not
wish to commit herself.

Method: The adult takes the baby's fingers one by one, starting at the little finger and ending with the thumb, reciting one of the first five words for each finger. Taking the baby's open palm, the adult taps it rhythmically and recites sentence (6). She then circles the baby's palm

37. Advice to the Young

(Mr. Robert David)

539*
861

(1) I will tell [something] thus, again. (2) Some time back they advised me too. (3) When I was little. (4) And I remember it always, that. (5) Though even at that I did not do right sometimes, perhaps. (6) And when I was big and had finished school, then at that time I used to go around any old way, going in with [bad company] just as they told me, "Do not go among those who will do you evil! (7) [They] will give you a bad name. (8) [They] will teach you evil, something." (9) Thus they told me, long ago.

(10) "And you try to walk like a man, just as some of us have done. (11) And we have lived so long, although life is short. (12) If you do evil, then something will catch you, [and] they will kill you somewhere. (13) And even that same person will tell about you, 'He did it first,' who did it to you first. (14) He dares you to do something which is not right." (15) So thus they told us long ago, and to walk away [from evil]. (16) "If [someone] does not speak nicely to you, then walk away," they said. Yes. (17) "'I do not want to listen,' thus you will say. (18) Let him call you something, sometimes those young men, thus call, 'He is a woman. (19) He is nothing. (20) He thinks like a woman.' (21) Because [you] do not do just as they themselves do. (22) And some want to outdo each other, doing something bad. (23) And he says, '_I_ am a man,' he says, calling himself [thus]."

(24) Thus they advised us long ago, to do that way. (25) "And, being cheerful, also, all will love you," they said. (26) "Anyone at all will love you, if you will be a good man," they said. (27) "And they will sympathize with [lit. "pity"] you, if something happens, if someone of yours dies—some friend, your close relatives. (28) So they will help you. (29) And anyone knows you [i.e., anyone will be your friend]," thus they [said] to us, "If you will meet anyone cheerfully. (30) You will not be ashamed, if you meet someone, who lives around you here, for so long."

(31) And they advised us thus, "Walk truly. (32) That is good. (33) It is the best [lit. "in a state of having outdone"] everything, if you will walk truly. (34) Do not tell anything falsely to anyone. (35) Do not imitate anyone doing something evil, which you see. (36) Love everyone thus—women, men, everything, elderly persons of that sort. (37) And you'll see that old man, who has now lived a long time. (38) Do not make fun of him either," they said. (39) "Do not make fun. (40) You

861

will be that way too, sometime. (41) All of us will be thus, we will grow old." (42) Thus my old man [father?] told us—often to us in the evening—even in the evening he spoke to [us] thus. (43) In the evening, [as] we were sitting around the fire, in our house.

(44) And he always advised me thus, "Living like that is good," he said. (45) "If you do anything [wrong] like that, then you will never be able to live here—if you would be a trouble-maker—no. (46) Everything would hem you in, evil. (47) And the law would also follow you. (48) They will always catch you," he said. (49) "[You] can never hide from the law today. [177] (50) The white men have brought us the law. (51) So we will do thus—now we follow it, we have with them—divided it recently—since we divided up the country with them—so we will do thus. (52) We will live as they have told us, having laid down the law on this reservation. (53) And they want us to live in this way, as long as we do not do thus, evil. (54) Then they would take us there, and they would put us inside, there where you do not come back out." (55) Thus they told us, long ago. (56) That's as far as [I will tell it].

Introductory Note to Text 38

The informants for this text were Mrs. Amanda Cowan, Mrs. Pansy Ohles, and Mrs. Cowan's son, Ransome. Mr. Andrew Ortiz, Jr., a young Klamath friend who does not speak the language but who has a great interest in the old ways, was also present.

Mrs. Cowan is reputed to be the oldest living member of the Klamath tribe, and her age was variously reported as 100, 102, and 104. She retains all her faculties, and the day the author's party visited her, she was spry and cheerful and delighted to help the author understand her language.

Mrs. Ohles began the conversation by describing one of Mr. David's myths (Text 13), which she had heard on the author's tape recorder, to Mrs. Cowan. The machine was turned on at this time, and the conversation was left to run more or less freely thereafter. [126] Later, the author asked about various Klamath forms whose meaning he was unsure of, and also about animals and plants, hoping to add to the corpus. Near the end of the session, Mrs. Ohles discussed kinship relationships and

autobiographical incidents. The end of the tape arrived just as Mrs. Cowan was beginning to feel tired, and the conversation came to an abrupt end. 124

The tape has been considerably edited to remove false starts, English portions, fragmentary or unintelligible sections, and other such "noise." The author's questions were originally asked in broken Klamath, and this has been put into English in order not to give rise to mistaken statements about the language. As was done above, personal names have been omitted out of respect for the individuals involved. Utterances by different Klamath speakers are indicated by their initials, viz., AC, PO, and RC, and the author's utterances are marked by PB. 124 128

38. A Conversation (among several)

539* 124 [824]

(1) PO: Yes, little Coyote, on whom [Gmoƙamč] stuck those things—that we call cattails, which was the reason, his fur is bad.

PB: Do you know any myths?

(2) PO: Could you tell a myth to me? (3) I wonder if you would tell a myth?

(4) AC: I don't know how. I don't know how to tell myths.

(5) PO: Do you remember when the white men first came? (6) Do you remember that?

(7) AC: The girls [i.e., nurses] asked me there in the "hospital" thus, "How long have you lived, how long?" (8) So I said, "There were no white people here at all, when I travelled around here." [173]

(9) PO: How big were you, when the white men came? (10) How big were you, when the white men came—when you recall the white men coming for the first time. (11) How big?

(12) AC: Yes, I was big [i.e., "grown up"], big. (13) I know a lot. (14) I was big when they fought the war [i.e., the Modoc War], over there, across there. (15) I being big, I know a lot. (16) But there were no white people anywhere around here, there were none—thus I told those white people [i.e., the nurses]. (17) There were none. (18) Only we Indians were many around here, Klamath Falls people. (19) Many Indians' land this was, [I?] said. (20) "?o···," they said, "Yes..." (21) So I have lived so long, I said. (22) "You have lived a very long time," they said, "It was long ago, when there were no white people, long ago," they said to me, the girls there, from the "hospital."

---

[192] [83] /ge·/ "this, this one" here refers to the investigator, whom Mrs. Ohles indicated by a gesture.

[103] [84] Mrs. Cowan may have been referring to the town of Bligh (Klamath {blay}) or using the form in its meaning of "above, up." The river mentioned is probably the Williamson River, but may refer to some other stream.

[103] [85] /gome·ksi/ "Cave-place" was a large settlement in aboriginal times. See no. 29 on the accompanying map in the appendix.

[86] /ʔiwli·wa/ "on the edge" was a village site. It seems to be the same as that mentioned by Spier, op. cit., on his map as no. 47 (no. 30 on the accompanying map in the appendix).

[87] The lexical meaning of /q̓ačwe·č/ could not be determined. For its location, see no. 27 on the accompanying map in the appendix.

[88] /čniWi·ls/ also was not analyzable. Mrs. Cowan did not give its location.

(23) PO: Would you tell something good, do thus (?) [at our] asking? 539*
(24) That's what he wants, this one, and he asked me thus, a little while 124
ago, "Why are there so many house-pits, on the Marsh? (25) Did they 173
live there at that time, even in the winter?" (26) And I said, "I do not
know." (27) Did they live there on the Marsh in the wintertime? [361]

(28) AC: Yes, all. (29) They lived everywhere. (30) Many there on the Marsh too, many lived all around it. (31) They lived [there] every day, even in winter. (32) And these Indians lived around here, many, the same way these [people lived] also up above, all the length of the river. (33) These living places were over there, those house-pits. [342]
(34) Thus (Proper name) said to me long ago, "What did this used to be?"
(35) So I said, "Our grandfathers used to live there, that—at that Qome·kai.
(36) The house-pit was on this side long ago, that of my Grandfather (father's father)." (37) Thus that (Proper name) told me. (38) It was there. (39) And they called [them] "ʔiwli·wakni·" that house-pit lies there, he told me. (40) And in that same way those (Proper name) are our grandfathers, as I told [her, i.e., the questioner mentioned above in Sentence (34)]. (41) So [she] said, "Yes, was it thus? (42) No one told me," [she] said. (43) "Yes, these were living places all around here, [103]
this, this was Q̓ač̓we·č̓, this mountain—the mountain was called Q̓ač̓we·č̓."

(44) PO: What is that Q̓ač̓we·č̓?

(45) It is something from the old times—some myth. (46) All of the mountains were named some way. (47) Thus said (Another proper name) long ago, "What is that Č̓niWi·ls? (48) Č̓niWi·ĺs, what is it?" (49) We do not know. (50) We did not name the mountains. (51) Thus mountains were named thus around. (52) Perhaps when God made this, He named the mountains, thus. (53) I asked many, old persons, and they did not know it. (54) Truly they did not know it, [and] I also do not know.

---

[103] [89] /ha·g krik/ "Hag Creek" might well have been put into quotations. The final /g/ is slightly unvoiced, however, more than an English /g/ in a comparable environment. Its location was not identified.

[194] [90] /si·p/ is English "sheep." Phonemically, it is Klamath.

[192] [91] /go·t/ is similarly English "goat." The flowering plant Mrs. Cowan referred to was blooming just outside her window. /do·/ "there" was explained with a gesture.

(55) It was named all up [the river]. (56) So two persons] asked me a little while ago, "Where was that Komčewi·s?" he asked me, "where there were Indians, where was it?" (57) And (Woman's name) [who is] deceased, said to me too, "Where is that Ni·Laqksi?" 539* 124

(58) PO: What is that Komčewi·s?

(59) AC: Yes, it is called thus on the Marsh. (60) At the end. (61) And [I] said, "This along the hillside is Ni·Laqksi. (62) They are all people's dwellings, that was this Sohi·yagye·ks—all along the hillside, Klamath Falls, many people lived [there]."

(63) PO: Do you know the names [of places] on the Marsh? (64)—How they are called. (65) I only remember, when I was little where we always used to go gathering mudhen eggs—at Charcoal Lake. (66) And now I can't find it. (67) And Sgotq́aks, I cannot find it now. (68) And what the white people called "Hog Creek," where we used to go and gather blueberries. (69) So they are gone. (70) Thus I told this one, "Those blueberries are gone now." (71) And I wonder if maybe those sheep, ate them up? [103] [222]

(72) AC: Yes, having trampled it all down in that way. (73) [Just like] this of mine [which I] had planted here awhile ago—very big around, with red blooms there—and that goat ate it all up. (74) However, it has grown back and shoots are coming there, which have something red on them, that kind.

(75) PO: What was a "goat" called?

(76) AC: I don't recall.

PB: What is a "q̇wi·l"?

(77) AC: They called a "sheep" that. (78) Those Modoc Indians [called it] a "q̇wi·l." [192]

PB: And one more, what is "swa·ya"?

(78) AC: What?

(79) PO: swa·ya.

(80) AC: Is it?—a myth, which they called little "Swa·ya." (81) Swa·y—whatever he was, I do not know. (82) There is a myth thus.

---

[103] [93] /gi·waskni·/ "from Crater Lake" refers to the myth by Mr. David (Text 10), or some version of it.

[196] [94] /ge·/ in the sequence /ge· lis q̓e·gyok/ "because this is gone" refers to Mrs. Cowan's brains. She made a humorous gesture at her head and added /gmočatk/ "old."

[196] [95] [ḫ̱osho̱ḡkya] : /hosakíya/ "caused it to jump shut" is usually used in Klamath for "locked (a door), shut tightly," but here Mrs. Cowan refers to the tape recorder, which she thought the investigator had turned off.

[96] Mrs. Chloe was searching for a word to describe the operation of the tape recorder. She first used /gena·/ "goes," but decided that this was wrong and so employed /waki·č̓a/ "revolves" (lit. "falls around"?)

[97] Mrs. Cowan omitted the word for "son" here and instead indicated him by a gesture of her head.

(83) And did anybody tell this one the myth from over there, that is a 539*
good myth. (84) It is [about] Crater Lake. 124

(85) PO: Probably no one. (86) I do not know it.

(87) AC: Yes, it is a very good myth [about] over there. (88) They told me something thus, that it was a very, very good myth. (89) However, [I] don't know it, because these [meaning her wits] are gone, being old. (Interruption.)

(90) AC: Thus he asked me, how they lived long ago.

(91) PO: Could you tell it?

(92) AC: Now he has stopped it [i.e., the machine].

(93) PO: Now he has done something—started it up again. (94) Now you can begin to tell, if you wish, anything at all. (95) Whatever you remember, tell that. (96) Now I have told it to you, and he will put it on there [i.e., on the tape]. (97) Now it is—something?—going—now it is revolving.

(98) AC: People were good, we Indians a long time ago. (99) We 539*
were good people. (100) And I have told my—we were good people long 124
ago. (101) We took even a little bit of food [i.e., all we had] for [some- 173
one]. (102) And, even though there was no food here, then we took for [431]
[somebody], something. (103) And it was this. (104) And doing it thus
it is called "They even divide up a flea." (105) Thus was the Indians'
way. (106) Thus they used to call it. (108) To someone, even a little
bit of food they took there. (109) Yes, for another, and they gave some
food, even [though it was] from a small amount, even if there was no
food, just being very sympathetic at that time. (110) Living with a great
struggle [lit. "having become very tired"], they got food. (111) Yes, [222]
even old ladies like these went off to dig roots. (112) They slung [a
basket] of this kind on their shoulders, and even the weak, now they knew
that there would be nothing to eat in the winter. (113) And because of [251]
that, they buried some food.

---

[77] /geˑks/ "this one" refers to her son, whom she indicated with a gesture.

[192] [78] /Jolayḱlageˑni/ "July Place" contains the English element "July." Mrs. Cowan here refers to the Fourth of July celebrations in the old days, but where and when this particular one was held is not known.

[79] /haja···!/ is supposed to represent Paiute speech, or at least some sort of Paiute interjection. The rest of their quoted utterance (/ya··· dwaˑ!/ is Klamath.

(114) PO: Yes, he wants you to tell that kind of thing, how they did things, to get food. 539* 124

(115) AC: So we used to live this way. (116) These people used to live thus, now have [they] become different. (117) Truly they have become different.

(118) PO: [They] have become white people.

(119) AC: Yes, become different. (120) So they buy anything, they buy anything whatsoever. (121) Long ago they did not do thus. (122) They gave, they gave even a small amount of food. (123) Yes, dividing it thus, just like dividing it. [431] (124) They lived thus long ago, helping each other, helping each other very much. (125) Now they do not do thus. (126) [One] will grasp only for money. (127) We eat only by buying. (128) Here they fish, but now only by buying do we swallow any fish.

(129) PO: Long ago they did not do thus.

(130) AC: Not thus. Helping each other very much they lived. (131) And long ago it was good, because it was thus, as I have told this one. (132) Now there is nothing. (133) Now there is no fun. (134) And [I] knew long ago, it was good, much to laugh at, something, everything to laugh at, everything. (135) There at the [Fourth of] July place Father raced them, having taken all his clothes off, only wearing his drawers. [526] (136) And all those Paiutes doing this—now they having gone there, then they ran off and left my father behind. (137) Then they roared with laughter, "ʔi···!" (138) Then that woman who used to be (Proper name's) wife became angry at them, because she said they were making fun. (139) Yes, they made fun. (140) "You [pl.] old people are making fun, but he is young," thus she spoke. (141) And they said, "HaJa···! ya···dwa·!" they said. (142) They did not talk nicely. (143) "He is not young. (144) He is old," thus said those Paiute women. (145) Then she got angry at them. (146) And thus it was long ago, many things to laugh at, many good things, various things [were] fun. (147) Today everything is quiet. (148) Now there is no poking fun about anything.

(149) PO: I told this one thus, [once] when they got together, three, or even two, then they said, "Do you know when someone [i.e., a certain

[192] [180] /ge·ks/ again refers to the investigator.

[551] [181] /Jo·n/ "June" is the name of Mrs. Chiles' niece, Mrs. June Dick, who is quite well known on the Reservation and in Portland (her present home) as a singer. She had gone to Sheridan, Wyoming, to sing at the annual gathering of American Indian tribes there. [533] [463]

[192] [182] /ʔi·t/ is the English word "eat," and /lo·st/ is English "roast." In speaking to the investigator directly, Mrs. Cowan felt it necessary to employ frequent English words as supplements to her Klamath explanations.

539*
124

one] was ever angry?" (150) And he was never one who got angry. (151) He was good. (152) I told this one. (153) They were there at QoWasdi, (Proper name¹), and (Proper name²), and—who—(Proper name³). (154) They were talking. (155) Someone else perhaps was talking too, whom they called "ĉopbaqs." (156) And they were laughing. (157) So I eavesdropped on them—I am an eavesdropper, as I told this one. (158) And he said to them, whether they had ever seen (Proper name³), being angry, or perhaps in a bad mood, or perhaps annoyed. (159) No, no [one] had ever seen [him thus]. (160) Then (Proper name¹) said, "But I have seen him angry once." (161) "ʔa···, when?" said that (Proper name³). (162) Then (Proper name¹) said, "When you were jerking at your horse's bridle!" (163) Then they roared with laughter. (164) Thus I told this one. (165) And I told June also, who always used to come and see you awhile back. (166) She is singing there, at Sheridan. (167) There where they call it thus, there where the Indians from all over are gathering. (168) She will sing there on Sunday, in the evening. (169) She must have arrived, there. (170) And she will sing dressed in a skin [dress], June. (171) She is my—my elder sister's daughter, who always comes to see you.

(172) AC: Yes, niece. (173) She is my [relation] on both sides. (174) I, her grandmother, to me—she considered me her little sister. (175) Yes, she called me her little sister, her grandmother. (176) So my picture of her which I was keeping, of the old lady, it is gone, someone has stolen it from me. (177) It is gone. (178) [I] thought to give it back [and] looked for it long ago. (179) I looked for it, but it was missing.

(The machine was temporarily turned off at this point.)

---

[103] "Smith River" was a source of ferns for funerals.

[104] /ʔoti·s/ may possibly be ‖sʔotnys‖ "long-object-attached-to," referring to its medicinal quality as a poultice. Mrs. Chiles was not certain whether /magi·p/ was really the name of the sunflower root or whether this was another root.

(186) PO: I saw Little Fire [woman's name] eating it long ago—moss.

PB: What do they call a fern?

(187) PO: How is a "fern" called? (188) That which they mix in with flowers, it grows like flowers, but has no flowers. (189) "Fern," that which the white people call "fern." (190) I can't show you any.

(191) RC: That which they always used to get there on Smith River. (192) That which is something—only foliage.

(193) PO: Which are large, it grows very long.

(194) AC: "čya·wisam," perhaps?

(195) PO: How?

(196) AC: It is "čya·wisam." (197) Yes, [they] eat its leaves like wokas, which are red, those leaves.

(198) PO: No.

(199) RC: Which are long ones.

(200) PO: The like of which we put on top [of a grave]—mixed in with flowers. (201) They are only those long, long leaves. (202) Perhaps having gotten some somewhere, we can show you, sometime.

(203) RC: Before [going] there to the graveyard, people used to get flowers, and then they mixed in that sort, which are long, long leaves.

(204) AC: Those which you [pl.] call "sunflowers"?

(205) PO: No.

PB: Then what would you call sunflowers?

(206) PO: "Sunflowers." I don't know.

(207) AC: Yes, now I have forgotten it. (208) How was it called—but that was applied [lit. "long object put on"], it was medicine, sunflower roots. (209) To be applied, the ones underneath. (210) Having thus become sick, [one] rubs it on oneself, the roots.

PO: Those are the sunflower roots, but she can't remember the sunflowers.

PB: And did the Klamath eat the sunflower seeds?

(211) PO: Did we used to eat that sort?

(212) AC: Yes, they were eaten, good, those seeds. (213) And they were just like sifted [wokas], the seeds. (214) They were "lopi·li·nas." (215) Having roasted them, the pod pops up, little black ones. (216) And only the seeds being thus, like sifted [wokas]. (217) [They] tasted good. (218) Yes, the Indians ate everything, all. (219) "Popping" it all

---

[252] [192] [105] /pa·p/ is English "pop." Mrs. Cowan referred to the "popping" of various seeds, much like modern popcorn. This was done to that type of very ripe wokas called /stokíwas/, to sunflower seeds, etc. The author had never heard of this process being applied to tule roots (/mayam lolp/).

[192] [106] /hok/ is English "cook."

[192] [124] [196] [107] /wa·l/ was mentioned by Mrs. Ohles in connection with a hazily remembered portion of a myth. She thought it was a type of root, and this is borne out by Mrs. Cowan. She repeated the name (Sentence 250) in a louder tone of voice, since Mrs. Cowan tended to be slightly deaf. To further clarify what she meant, she added Sentence 251, which is the myth speech attributed to the chief character in the myth she could not quite recall. The form /?oye···/ wavers off into silence at the end. It seems to be |?oya| : /?oya/ "gives a long object," but with modification of the final vowel.

539#

well, that wokas, tule eyes [i.e., tule roots], as they called it, white like this. (220) It was popped. (221) Indians ate everything, everything, they lived thus long ago. (222) And they lived well, they dug [roots] like this also, the Indians' potato [*Sagittaria latifolia*]—the Indians' "sweet potatoes." (223) Good, sweet, looking thus inside. (?) (224) But it was round, good.

124
173
262

PB: And what is "qlańe"?

(225) AC: "qlańa," yes. (226) It was good, even as food. (227) "Parsnips"—this just like a peeling [skin? membrane?] it bloomed. (228) Yes, it blooms just like "parsnips," but it smelled bad, that. (229) Smelled bad—it was "poison." (230) But it had blooms thus, blooming just like qlańa, however that stink of parsnips was not there [i.e., she here is speaking about "poison parsnips"—"sḱawankeam"]. (231) That was poison parsnips [*Cicutum douglasii*], bad. (232) It bloomed just thus, thus, like "qlańa." (233) But that "qlańa" was good—tasted good, sweet. (234) Good to eat raw also, and [as well as] having boiled and "cooked" it. [252]

PB: What did the Klamath call "garlic" or "onion"?

(235) PO: Which the white people call "onion," or "wild onion."

(236) AC: That is "pni." (237) It is from over there, something good like that. (238) They were little, like little "turnips," bitter. (239) They were in bunches. (240) They grew over there, to the east, here. (241) At Ya·ńi there. (242) [I] wanted Ransom to go and get some, to plant them, on some dry earth like this in the ground—thus there are many, many bright flowers. (243) They are good flowers. (244) However they are just like those onions, smelling just so. (245) But they have called them "pni." (246) They ate it well, the Paiutes. (247) It tasted good, sweet, having put it in a roasting pit, they "roast" it. (248) With all its skin having done thus to it, they ate it.

PB: Could you tell me what a "wa·l" is?

(249) PO: What was that "wa·l"? (250) "wa·l"! (251) "He didn't give his Granny the big 'wa·l'!"

(309) AC: blay, či. (310) ge· dak nen gina·t ẏayńa.

---

[192] [99] The form /q̓e·gitk/ is used for respectful mention of a dead person. It was
considered impolite to mention the names of the other person's deceased relations
[551] in a conversation, and this was extended often to refer to the names of deceased
[576] friends and acquaintances. Compare the English "the dear departed."

[100] Mrs. Ohles uses the form /blay/ here to mean only the town of Bligh. It
[103] may be that the vowel of the two repetitions of /blay/ in this sentence is somewhat
longer than is usual for the Klamath morpheme (blay) "up, above." It is
[193] certainly longer than Mrs. Cowan's /blay, či/ in Sentence 309. If so, this may
[194] account for Mrs. Ohles' failure to recognize "Bligh" as Klamath (blay).

the woman on this side, the "p̓a·sip." (290) And the "bloksip," [the woman on that side is the] "p̓e·wip"—now they are that many. (291) On this side they are two each.

PB: And what is a "p̓o·nip"?

(292) PO: "p̓o·nip," what is that? (293) How is he related, he whom they call "p̓o·nip"?

(294) AC: The "p̓o·nip" is a brother [woman's elder brother]. (295) He [they?] would be my "čočo·nip." (Great uncle.) (?)

(The conversation was carried on in English at this point, mostly about friends from the old days.)

(296) PO: . . . And how was he called, with whom she lived—whom she lived with?

(297) AC: No, she just lived with him for a little while. (298) Something herself, even being something to each other—they were some sort of relation to each other. (300) He considered [her] father an uncle [mother's brother], his absent one.

(301) PO: Yes, I thought so.

(The conversation reverted to English and drifted to a recollection of a personal experience from Mrs. Ohles' childhood. The machine was turned off during this time and was only turned on again when she returned to Klamath.)

(302) PO: . . . And she was sick with something for a long time. (303) And she was gone a long time, gone a long time. (304) So she was supposed to be gone only three days, and she was gone much longer, because she was sick. (305) And then he left us [lit. "fell off of us"], that (Proper name). (306) Then he returned, and sickness attacked, him next. (307) Then Mama having come back, she took us back to Bligh, toward Bligh. (308) What do they call Bligh in Klamath?

(309) AC: "Blay." (310) It is on this side of the mountain.

[TEXT CONTINUED ON PAGE 177]

#539 (311) PO: dam mat? (312) q́ay ni nen dada· domna.[111]

---

[124] [111]It seems strange that Mrs. Ohles had never made the connection between "Bligh" and (blay), but this is what she seems to imply here. Since she speaks such good English, she may have heard "Bligh" always as [bla·y] and (blay) as [bla˘<y].

(311) PO: Is that so? (312) I never heard that.

(313) AC: Then Yainax [from Klamath /ẏayńaks/]—it is a little mountain, there where (Proper name) killed that white man a long time ago, on that little mountain having led him up high there. 539* 124

(At this point the tape came to an end, and the conversation was broken off.)

Introductory Note to Text 39

This text was elicited with the aid of a series of fifty line drawings, prepared under the supervision of Alfred S. Hayes, as described in his article, "Field Procedures While Working with Diegueño" (International Journal of American Linguistics, vol. 20, pp. 185-194, 1954). Each drawing depicts some simple situation, and the informant is encouraged to describe the scene and make some theorisations about what might be going on. The numeration corresponds to the numbers of the pictures. The separate utterances are not otherwise numbered. 125

39. Response to Pictures

(Mrs. Pansy Ohles)

(1) What is he pointing at that tree for? One man seems to be pointing toward that tree, unhealthy [lit. "bad looking"], very thin. And what is this? A road, perhaps, I do not know. 539* 125

(2) These are two men. Perhaps they are walking around to plow or perhaps to cut hay. This one is pointing, one. And this tree stands in the open, alone.

(3) So these are three, four men also. These are four men. And one little boy way over there, but these are large. Again this one is pointing. What are they pointing at? I do not know. However, a road is running along—isn't this a road running along?

(4) Two men, one is running toward the tree. Perhaps he will relieve himself. But this one, I don't know what they are doing. Again he is pointing. What can be over there? And these are two roads.

(21) ge· ba·ĺa·ʔas ṕan, teyballat tgawlank wač́a·k. ṕaṕallis ge· wač́a·k gi.

(5) These are three men again also, the little one is absent in this picture. What is the matter? Maybe he is behind the tree.

(6) This is he again also—perhaps somebody else is running toward there. Yes, he is running. He is going fast. But these are walking. But whatever is this one pointing at, always?

(7) This is a woman. She is pointing too. [Her hair] is not combed.

(8) This man has come now. What is he doing here? This one is pointing again. This man has come now, as I said.

(9) Ya···, [she] has many men, two. [Her hair] is not yet combed. What are they pointing at? Perhaps someone is coming.

(10) This is a mother saying, "Go relieve yourself over there behind the tree! Don't let them see you!"

(11) Could this be the father, his, who is running there, towards the tree, again. Perhaps to relieve himself. This is a road. And perhaps they are saying, "Hide behind over there! Hide behind the tree!" And this is a different tree again. And perhaps this one has messed himself [lit. "relieved himself on himself"]—he has messed himself now. (See, he's bent down a little more, and he must have messed himself.)

(12) And these two men have come. I do not know who they are. Perhaps the father's—what? Older brother, perhaps?

(13) What is this? Perhaps a little girl? Again pointing! Towards there. I don't know why. That is a different tree also.

(14) "Ohhh, father, come and look here, what is this!" Pointing again.

(15) Perhaps there is a magpie's nest there. Perhaps she is pointing up at it. These are two men, and one little girl.

(16) This is a little girl again. Perhaps they are playing something. Perhaps he will hide from her, and she will find him, this little girl. This one is well combed.

(17) This one also is well combed. And this one says, "He is hiding from me there, he goes to hide behind the tree, but I see him." This man is something—possibly the father or perhaps the grandfather [father's father].

(18) These are two now, two children, aren't they? A little boy and a little girl. They are perhaps brother and sister, and [these men] are perhaps [their] father and uncle [mother's brother].

(19) A dog. He is sitting under—under what? Perhaps a chair? Perhaps a table. The dog has a long tail, and perhaps he has a broken back?

(20) This dog keeps jumping up and down, to look out through [lit. "toward" the window.

(21) This one is eating bread, the dog standing on the table. This dog is a thief.

[192]
[196]

[183] Mrs. Chloe was not sure about [sg̱ʔldgnk] : /siʔstgnik/ "plural objects divided from themselves" for "abyss" or "chasm." She added /ʔakẏa?/ "Maybe?" in an aside to the investigator.

(22) This man is giving [food] to his dog. He's giving something, he's giving food. Not bones. Perhaps he is giving water.

(23) This is some bird—"quail"—perhaps this dog is bringing this quail home in his mouth.

(24) This is a little badger. This is winter—this tree has no leaves. And this dog the badger—no, not a little badger—it is a little rabbit. He is chasing the little rabbit.

(25) This dog is hot.

(26) This is a cow, eating in the open. A mountain, perhaps near a river. The mountain is over there. I don't know which mountain it is.

(27) This one is planting [lit. "putting down plural objects"]—perhaps he is planting corn. And it is very early also—this tree has not yet leafed out. Now it is spring.

(28) How is this, he is leading the horse not having tied it on well. This rope is not well fastened around its neck. Perhaps because the horse is tame.

(29) This is without a saddle, without a rope, without anything. However, he is going home riding it perhaps toward home, perhaps going back to the stable.

(30) This one is climbing to get [apples], this one, perhaps to pick apples. He is climbing to get [apples].

(31) Ya···, isn't this a snake! A woman and two men, and they are saying, "Ya···, there is a snake over there!" Across this divide (Maybe?) They are standing on the edge, and the snake is on that side.

(32) Two snakes. And they are three on this side again. I do not like snakes.

(33) Ya···, now this one is chasing them. One has fallen in, the woman is running, the man too, and he runs with his hands thrown up. This one, being frightened, has fallen in here. Perhaps he is falling into the water.

(34) What is this? The sun is rising. And this something—it is not setting. The sun is rising. Early in the morning they always something—the white man's canoe—"sailboat"—sail. And this is a piece of wood lying here on the edge.

(35) This one is going in a canoe, now at sunset. And he is saying, "Now I'm going back." He came to see the woman. Perhaps his sweetheart.

(36) Now they are visiting. And they have just sat by the edge. However, they didn't go to fish, they have no fishpole. So this is setting, perhaps, just about to set.—Ohhh, I did not see this, a pelican soaring around.

(37) Many, many trees. What are these? "Peaches" perhaps hanging up there? Why didn't they tell it, so I would know what to call them. This is a fence running along—is this someone's land? This is a fence running along.

(38) Now it has grown big, that which they had planted. The corn. I don't see anything else. Now no one is picking any. The corn is not ripe also.

(39) A tree standing on the edge. It is just one tree standing on the edge alone. That is a mountain across there—"Mount MacLoughlin" perhaps?

(40) I only see hands. A thumb. Ugly hands. Perhaps this one is hurt, he has injured hands. One is very fat, one is not.

(41) What is this? Bleeding? Perhaps water is dripping, perhaps blood. Perhaps they cut them off. Perhaps they are washed in water. I don't know.

(42) This woman is going toward the table, to put something on the plate—perhaps to take away the plate.

(43) She is carrying it along [plate], perhaps taking something back, towards there. She is carrying some plate.

(44) This is a stick lying here. Why is this, the stick here? Will he beat somebody?

(45) Ohhh, he is going outside to beat somebody. He is going, carrying it. Perhaps he will beat somebody outside. Perhaps he will hit his wife.

(46) These are going to church, leading their children, looking nice. Yes, all are well combed, and they are smiling. They are going smiling, and they are not pouting.

(47) Who are these? "Lone Ranger and Tonto"? I don't know what this is, something—they are standing on a cliff. A slope is not thus. This is a cliff.

[TEXT CONTINUED ON PAGE 185]

(48) ʔo···, ƛaƛaksni do·ksƛant. čoyč ge·, "gepgabli! gepgabli! Walli·sdat waq ʔa·t hi·t gak̓wa?" wage·nha sas naʔas, q̓ay ni sʔaywakta.

APPENDIX

KLAMATH PLACE NAMES WITH MAP

128

The accompanying map of place names has been largely adapted from 127
Leslie Spier, "Klamath Ethnography" (University of California Publica- 103
tions in American Archaeology and Ethnology, vol. 30, 1930. The present 114
writer has checked and retranscribed most of Spier's forms: only seven [124]
of Spier's place names could not be obtained from the author's informants. No attempt was made to recheck Spier's supporting geographical and ethnographic data, however.

Ninety-two new place names have also been added to the map. Many of these are not settlements (as Spier specifies for his list), but are places used for food gathering, places named for some outstanding natural feature, places named after some mythological person or event, etc. The author has appended what descriptive material he could obtain to each new place name in the list.

Forty-five additional place names are not shown on the map but are 128
included in the Dictionary. These are either uncertain as to location or 103
are places not found within the limits of the map.

The map has been renumbered to accomodate the new place names, [127]
but Spier's original numbers are given after each entry for purposes of
comparison. It must be noted that geographical locations on the map are [124]
only approximate and in some cases quite hypothetical (e.g., where the informant could only recall that a given place was "about two or three miles over that way").

Forms are given in phonemics only and are translated wherever possible. The morphophonemic forms of these names are listed under "place names" in the English-Klamath section of the Dictionary, along with some indication of their morphemic content.

KEY TO THE MAP OF PLACE NAMES

1. /moc̓o·y̓a·ks/. Spier 1.
2. /qdaywa·s/ "Rock-Nest." Spier 2.
3. /gapgaʔa·kksi/ "Little-Pine-Place." Spier 3.
4. /ʔiWʔa·l̓a/ "On-the-End." Spier 4.
5. /q̓la·jaksi/ "Blueberry-Place." Spier 5.
6. /doylk̓at/. Spier 6.
7. /ʔawalwasge·ni/ "Island-Place." Spier 7.
8. /ga·qs ksawalye·ks/ "Carry-Crow-up-the-Hillside."
9. /č̓ik̓as waLaqk̓is/ "Bird-Lookout." A hill across from /ʔawalwasge·ni/.
10. /waktali·s/ "Lodgepole-Pine-Place" (?). Spier 8.
11. /lalʔa·ks/ "Little-Hill-Place." Spier 9.
12. /wisingam dinwas/ "Snake's-Lying-in-Water." A campsite for wokas-pickers.
13. /čaba·ni/ "Herd-Going-to-the-End." A dwelling.
14. /l̓k̓om ʔews/ "Charcoal-Lake." The name of the small marsh shown on the map.
15. /somdi/ "Mouth-Place." A campsite where the river enters the forest.
16. /c̓omsʔam gotq̓aks/ "Sucker's-Going-up-out." A campsite near /somdi/.
17. /n̓oksi/ "Head-Place." Small village site near Kirk.
18. /sniWa·tgalsi/ "Eat-First-Place." A campsite.
19. /ʔeqčsalk̓is/ "Sharpening-Instrument." A traveller's campsite.
20. /sqamdiwa·s/ "Sqamdi's-Den." The home of a dangerous mythological being. See Text 19.
21. /gosʔam gotq̓aks/ "Swan's-Going-up-out."
22. /yalyalʔant/ "Where-It-Is-Clear." Spring Creek.
23. /weq sqatq̓aks/ "Limbs-Stick-out-of-Water." A large spring.
24. /q̓bolWiʔamge·ni/ "Plant (sp.)-Place." A large village on both sides of the river.
25. /dalli·ks/ "Standing-on-the-Bank." A village site.
26. /lobaqskaaksi/ "Chalk-Place." Spier 10.
27. /q̓ač̓we·č/. Spier 12.

28. /ʔoqsosʔam sloqtis/ "Cough's-Spitting-on." Also called /yawqsalks/ 103
"Medicine-Getting-Place." A rock on which consumptives spat 127
to gain a cure.
29. /ġome·ksi/ "Cave-Place." Spier 13. 102
30. /ġoqm̓a·kksi/ "Little-Caves-Place." 133
31. /hehǰi·ʔasamksi/ "Hehǰi·ʔas'-Place." The home of a mythological being. See Text 8.
32. /ġoqq̓a·kksi/ "Little-Rivers-Place." A spring.
33. /kiwi·ki·ns/ "Taking-out-of-Water-with-a-Pointed-Instrument." A spring.
34. /wačksi/ "Horse-Place."
35. /n̓a·l̓aksi/ "Snipe-Place." A spring.
36. /kolsʔamksi/ "Badger's-Place."
37. /ġawamġe·ni/ "Spring-Place." Spier 14.
38. /ġoksi/ "Swan-Place." P.O. gave /nġoksi/.
39. /daqn̓i/ "Sharp-One."
40. /mbosaksawa·s/ "Flint-Place." Spier 17.
41. /tġalmaksl̓a/ "West-Side." Spier 18.
42. /qdaydi/ "Rock-Place." Spier 19.
43. /ġle·čp̓ak̓i·s/ "Clam-Eating." Small settlement.
44. /ǰigyes/. Spier 20.
45. /q̓oLtʔam wa·s/ "Otter's-Den." Spier 21.
46. /ʔal̓a·wiks/ "Long-Object-in-the-Sun-Place." Spier 22
47. /yaʔa·k/. Spier 23.
48. /č̓aq̓wi/. Spier 24.

[For the native text and translation of Klamath myths, see category 116, pp. 6-21, 24-117, and 126-185.]

Because it is for several reasons considered important, the fact that each 125
Klamath subject was, in general terms, made aware of the intentions of the 123
examiner and the logic of the test procedure should be emphasized. Recently, 125
Hauck has described a different approach used for research among the Unitah- 114
Ouray Ute, where he modified the usual Rorschach procedure by concealing the
purposes of the test beneath a supposedly innocuous "cover story" (Hauck 1955: 10).

This approach to field testing is subject to criticism on several grounds. In 125
the first place, it is somewhat less than ethical to conceal the purposes of a 123
test so as to facilitate cooperation, and then to publish results in line with (114)
original intentions. Occasionally, this approach has been used in culture and
personality research. It entails the assumption of a kind of mechanical meaningfulness of any responses to projective tests, however administered, and whatever the test taking attitude of the subject. At a minimum, the subject has the right of knowing what he is involved in and the privilege of refusing. Secondly, where clinical methods of interpretation are to be employed, it is essential that field research using projective tests as closely as possible approximate the clinical situation. This assumes that the cooperating research subject is more apt to reveal important aspects of himself if he clearly understands the
intentions of the examiner. Indeed, one purpose of projective testing is to 120
facilitate communication about difficult topics, not to unduly impede it with artificial barriers.

Another aspect of this issue is that most American Indian populations include 12
some members with higher education, or, like the Klamath, others with some 177
awareness of the "ink-blot" or the "picture" test via spectatorship in the mass (171)
media. Because of this awareness, any subterfuge or concealment of test objectives may be publically revealed and further distorted. The consequence of this can only be a confused or negative appraisal of field research and field researchers. Given the existing wariness and suspicion of many American Indian populations and their concern with their status as "Guinea Pigs," such an outcome is not very desirable. Finally, it is quite conceivable that another field worker might want to pursue similar research in a situation where the purposes of a test have been concealed. If so, he will have to support the original lie, either by accepting it or by expanding upon it.

Quite frequently, the success of field research in the area of culture and 12
personality studies turns upon obtaining an adequate sampling of a population in a very limited period of time. Perhaps, as is suggested by the extensive sampling of Hallowell and the Spindlers in repeated field sessions, it is the time factor which is crucial. In terms of the ethics of research, the validity of results, the richness of materials collected, the possible consequences of distorting objectives so as to obtain cooperation, and the implications for future field work, the alternative approach of using a "cover story" to obtain quick results is not desirable.

The Klamath personality research grew out of Clifton's participation in a larger 114
study of Klamath reservation culture. The initial, unpublished, evaluation of the test and life history data was intended to improve understanding of the psychological consequences of acculturation in the Klamath case and to give additional depth to other studies of styles of Klamath behavior. This first approximation, although suggestive, did not prove entirely satisfactory, largely because of too mechanical a utilization of what are, in the trade, called "standard interpretative hypotheses." In short, the initial report was too cookbookish. At the same time the possibility of bias had to be considered,

114 for the field researcher and analyst were one and the same person. It then (120) seemed potentially fruitful and appropriate to organize a collaborative effort with an experienced psychologist, and it was at this juncture that David Levine began participating in the research. The result of that effort is this report, with its markedly inductive and qualitative approach.

121 Aside from an assessment of the attributes of Klamath personalities, we are, thus, concerned with several somewhat broader questions. Because of the former, the Psychologist has set one task as the idiographic analysis of each subject's Rorschach record, but because of the latter concern this analysis must be considered doubly idiographic. We are at one and the same time concerned with two kinds of wholes, each Klamath person, and the total socio-cultural setting. On the one hand, the Anthropologist's interest lies in the relations between personality factors and the configurations of Klamath Reservation Culture, and, thus, in Redfield's terms, in contributing to an understanding of the reservation as a "unique analyzed system" (Redfield 1955). [125] On the other hand, the Psychologist became interested in this setting because of his concern with using the Rorschach as one measure of Ego-development, or the level of psychological maturity. In this respect, and aside from the intrinsic interest of each, the ten case studies are seen as a possible means of bringing to bear certain portions of psychoanalytic theory and Werner's genetic psychology theory upon the task of explaining some aspects of the styles of behavior prevalent in the peculiarly stifling environments of American Indian reservations. We are, therefore, interested in developing useful approaches to larger problems and in building hypotheses.

12 With respect to the division of labor, Clifton collected the original data and was responsible for writing Sections I and II and the introductions to the case studies, while Levine gave his attention to the analysis of each case. The concluding section is a joint effort. Levine's analysis of the Rorschach records has been without extensive foreknowledge of the characteristics of life on or the history of the Klamath reservation, and without foreknowledge of the particular experiences or cultural status of the subjects. The collaboration of Anthropologist and Psychologist, the inductive, case-study approach, and this "blind" analysis thus put this report in the culture and personality tradition most recently represented by Gladwin and Sarason's Truk study. Indeed, this report was partly prompted by Gladwin and Sarason's recent complaint that "...studies which would refine and carry forward this or other systematic methods 121 of case analysis have not been forthcoming." (1959: 175). While we agree that analyses of comparative data should be made available, in all modesty we cannot lay claim to a refinement of the case study method. Again, we are concerned with developing useful theoretical ideas, or in finding a place to transplant an existing idea, rather than with methodology.

122 We are indebted to Zygmunt Piotrowski for his approach to Rorschach analysis and for suggesting the possibility of our collaborating, to Luther Cressman of the University of Oregon for providing facilities for publication and for initial support of the field work, and to Theodore Stern, also from the University of Oregon, for continuing assistance and encouragement in and out of the field. (121) Section II of this report draws heavily upon Dr. Stern's published and unpublished Klamath materials, for which we are particularly grateful. During 1958, James Clifton's field work was supported by a Social Science Research Council Fellowship for Training in Social Anthropology, while support for the 1959 research was provided by the National Institute of Mental Health in the form of a pre-doctoral fellowship and research grant. The National Institute of Mental Health has, additionally, financed publication costs of this report.

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all 121
aspects of the preceding case studies we intend to pursue some of the implications
of certain striking characteristics of Klamath personalities. Aside from
this descriptive effort we also intend to derive, hypothetically, an association
between these personality attributes and Klamath acculturation experiences.

Certainly the most pervasively shared attribute of Klamath personalities is the 156
one we have chosen to call guarded restraint. This label is intended to designate 157
the general attitude towards self and interpersonal relationships which has
emerged from the analysis of Rorschach records, life-history materials, and observations [12]•
of behavior. Guarded restraint, therefore, may be taken to mean the
prevalent suspicious and guarded attitude towards life of the Klamath subjects,
their wariness as regards significant others, and their apprehensions as regards
their environment generally. This attribute, as we conceive it, has many facets.
It includes an unconscious as well as a more deliberate muting of responsiveness
to the actions and the mere presence of others, a shallow, non-committal attitude
towards membership in various social groups and the goals of these groups, and
a characteristic which ranges from simple lack of trust to outright fear of the
behavioral milieu.

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem 121
somewhat ambiguous. The empirical referents on the level of observable behavior
are, however, highly visible. They may be observed in a wide variety of behavior
settings, from the informal and unstructured relations within a teenage
clique or an adult drinking group to the more organized setting of the family
and household.

The psycho-cultural phenomena we have labeled as guarded restraint over-laps 121
with what others have called Klamath individualism. Seen in this perspective, 157
we may, perhaps, introduce a somewhat richer way of analyzing and gaining insight
into the nuances of Klamath behavioral styles. This approach is, we hope,
something more than just a different way of looking at the manifest separatism
and incohesiveness of family groups, a more fruitful manner of examining the
atomistic structure of Klamath reservation sodalities, and a means of appreciating
the psycho-dynamic causation of the constant fractionation of Klamath political
groupings. The evidence of these case studies, then, suggests that few Klamath [156]
are capable of fully identifying with other persons or of committing their loyalties
to concerted group action.

We feel that this major descriptive conclusion is, in large part, a product of 125
the case study method used in analyzing the Rorschachs. Moreover, it is our 128
belief that this conclusion could not have been obtained from an analysis of a
composite psychogram based on formal scores. As anyone who has ever read reports
based upon the statistical or modal personality approach well knows, such reports
are ridden with dynamic cliches and are largely sterile until filled out with
examples of the qualitative features of individual records. In this report
Levine has entirely discarded the lumping of group scores and concentrated upon
an analysis of qualitative features of individual records buttressed and supported
by the use of formal scores and relationships. The importance of this approach
is shown by the fact that the reserve and guardedness that characterizes Klamath [157]
does not always show up in individual test records in the same form. Most frequently
an important clue is had from the presence of restrained, watchful, wary
figures in human and animal movement responses. Indeed, this type of movement

FOREWORD

The Survey of California Indian Languages, Department of Linguistics, 114
University of California, Berkeley, was fortunate to have Mr. M. A. R. 12
Barker as one of its field workers during the summers of 1955, 1956, and 1957. He had come to us from the University of Washington where he had had good training under Professors Melville Jacobs and Fang-Kuei Li and, after a year's further training at the University of California, he chose Klamath as his field language. Having located some good informants living in Chiloquin, Oregon, he was able to make an intensive study of the language and to obtain full materials for a grammar, a set of texts, and a dictionary.

Since 1957 Barker has been connected with the Institute of Islamic 114
Studies, McGill University, Montreal, Canada, where he teaches Urdu, Arabic, and general linguistics. In the midst of these many other duties, 128
Barker has found time to write up and send to the Survey a series of Monographs on the Klamath language. The present work, Klamath Texts, was sent to us first, but after the morphemic analysis was complete and the dictionary had been prepared, he sent us a list of corrections which he wished to have inserted in the typescript of the Texts. Working under our direction, Mr. Haruo Aoki, advanced graduate student and research assistant in linguistics, has carefully incorporated the necessary corrections. A few other minor changes have been introduced by the Survey's unofficial editor. For the most part these were dictated by the necessity of presenting the Klamath materials in more than one volume—the typescript of the Dictionary alone is nearly a thousand pages long! The changes are as follows: (1) What was originally an appendix to the Dictionary, namely Klamath Place Names with Map, has been removed from that position and included as an appendix to the present, shorter volume, the Texts. (2) The first paragraph of the Introduction to the Texts has been rewritten to include the names of the Klamath informants for the texts, since these do not otherwise appear except in the Introduction to the Grammar. (3) Bibliographic references are given in full wherever needed, since the Bibliography does not appear in the present volume but is included with the Grammar.

PREFACE

101 114 121 The following comparative ethnographic study of fifteen northeastern California groups and one group in southern Oregon is based on approximately three and one-half months' field work (July-October, 1936), undertaken while serving as Research Assistant in the Department of Anthropology at the University of California. During the six months' period which the appointment covered I incurred numerous obligations for assistance.

000 To Dr. A. L. Kroeber, director of the culture-element survey, I am indebted for much sound advice, never-failing coöperation, and many courtesies extended throughout the term of appointment. To Professor E. W. Gifford, Dr. Robert H. Lowie, and Dr. Harold E. Driver I am likewise under obligations for their coöperation and numerous courtesies.

I also wish to thank those authors who have written the detailed and pioneer monographs on many of the groups covered in this study; these include Drs. Leslie Spier, A. L. Kroeber, Ralph L. Beals, Isabel T. Kelly, Cora Du Bois, Edwin M. Loeb, and Mr. E. W. Gifford. Many of these authorities, and also the late Professor Edward Sapir, of Yale, supplied the names of reliable informants for the groups I was to study, and otherwise oriented me concerning field conditions. To all these scholars I am greatly indebted, both for their personal coöperation and for their valuable publications on various tribes in or near the area surveyed. Since I worked with both the Shasta and the Maidu, it is almost needless to mention how often I leaned on the late Dr. Roland B. Dixon's ethnographic studies of these two tribes, and how delighted I was to obtain western Shasta data from Sargent Sambo whok some thirty years before, had been Dr. Dixon's chief informant.

114 The difficulties of living on an extremely mobile field trip were lightened by virtue of having with me three interested companions. My husband, Dr. C. F. Voegelin, and our daughter, Gail, spent July and August in the field. To Dr. Voegelin I am deeply grateful for frequent linguistic aid and for encouragement in the pursuit of a new ethnographic field technique. To Gail, and likewise to my father, Mr. Roscoe Wheeler, who proved an ever-cheerful companion during the latter half of the trip, I wish to express a happy appreciation of their comradeship and their responsiveness to informants and informants' families.

115 Many kindnesses were extended to me during field work. Mrs. John Perry and her late husband, of Greenville, offered the hospitality of their home and were helpful in suggesting suitable informants. Mr. and Mrs. C. H. Barton, of Horse Creek, temporarily released Sargent Sambo from their employ so that I might work with him. Mrs. Lucy Thomson, my informant for the Southern Nisenan, had my father and me as guests in her home during our stay at Stanfield Hill. Mrs. Winnie Shiffbauer, Modoc; Ben Bridge, Achomawi informant, and his wife; and Mrs. Amanda Wilson, Valley Maidu informant, were likewise generous in hospitality. The interest and cooperative spirit I met with among these and many others of my informants puts me under a debt which cannot easily be acknowledged, but which will always be a pleasure to recall.

122 Assistance in the preparation of field material for publication was furnished by the personnel of Works Projects Administration Official Project No. 665-08-3-30, Unit A-15.

CULTURE ELEMENT
NORTHEAST

B

ERMINIE W

INTROD

121 The list of elements used in the field for this study was assembled from six other lists for adjoining areas which had been gathered by members of the culture-element survey and were still in manuscript form. Dr. Driver, Dr. Kroeber, and I collaborated in preparing the list which I was to use. It contained some 5500 elements. While working in the field I added and occasionally subtracted elements and often reorganized entire sections of the list; in the final preparation of the manuscript further reorganization was effected. I consistently attempted to keep complexes of elements together, in order to present a more intelligible picture of the patterns of the various cultures as wholes. This was not an easy task, since elements tended to be regrouped, in kaleidoscopic fashion, among the different peoples studied. To help solve this difficulty frequent use has been made of cross references in the ethnographic notes which accompany the lists.

124 125 With respect to field method, I found that working with an element list is a definite aid in making quick rapport with informants. Several of the sixteen informants interviewed repeatedly expressed both astonishment and respect when the questions I put to them from the list hit the cultural nail squarely on the head. Far from a list deterring informants from volunteering information, it obviously stimulated comments. All volunteered information, unless it came at too rapid a rate, was jotted down in a separate notebook which was kept open beside the element list itself.

I should like to emphasize here that while questioning informants I never used the element list in the rigidly mechanical "yes or no" fashion which some critics of element-list work take for granted as being a part of the field technique. The content of the ethnographic notes appended to the element list itself bears witness to the fact that informants were not only willing, but anxious to elaborate on the questions put to them. Some queries, such as whether the floor of a winter house is dug out or level with the ground, could be asked directly and a yes or no answer relied upon. But if the answer to this question was merely "Yes" the query "How deep?" always followed as a check. The answers to other questions, such as number of directions, month names, seasons, or whether the autonomous group consists of a single village, a group of closely adjacent villages, or a com-

[47-A]

Section I. Introduction

This is a report on the personality dynamics of a highly acculturated American 121
Indian population, the Klamath of south-central Oregon. The report consists 125
of blind, idiographic assessments of ten selected cases. The subjects are
male and female Klamath of various age groups who occupy different status positions [101]
and who perform widely divergent social roles in the context of Klamath
reservation culture.

As is the case with similar culture and personality research, one aim of this
report is descriptive, that of recording variant attributes of personality,
attributes which are not frequently observable in the usual clinical or research
settings of western culture. Thus some mental health and social science personnel 121
may find the report of value because of the unusual character structure of the
subjects, but those who serve reservation populations in clinical settings and
those who observe for research purposes will find these ten Klamath subjects
familiar. In addition to the objective of description we hope that the analysis
of these cases will contribute to an understanding of the psychological— particularly
the interpersonal aspects of Klamath reservation life. Beyond these
goals, the synthesis of psychological and cultural data drawn from observations
of the contemporary scene may throw some additional light on the psychological
consequences of acculturation.

The ten case studies in this report were drawn from a sample of fifty four 125
collected in 1958-59 by the Anthropologist during two periods of field research. 114
The original research was aimed at collecting psychological test data so as to [101]
make a contribution to a larger study of Klamath Reservation Culture, which involved
both a historical or acculturational study of processes of change and 121
a study of the contemporary reservation community. The larger Klamath study is
being supervised by Dr. Theodore Stern, of the Department of Anthropology,
University of Oregon. The results of the original personality study have been
reported elsewhere (Clifton 1960). This early research effort was predicated
upon a loose statistical model, and the aim was to correlate personality types
with types of socio-cultural adjustment. It was assumed that the very great
range of kinds of behaviors and types of adjustment apparent among the Klamath
reservation population could be associated with variations in personality attributes
as measured by projective tests.

Two distinct variants of this statistical model were attempted and discarded
before a third was developed. The first aim was to collect a random sample [125]
of a target population composed of persons recognized as members of the Klamath
Tribe, who currently maintained a residence on or near the reservation, and who
had lived all or most of their lives in that area. One of the two models had
this population stratified by criteria which supposedly isolated clusters of
types of socio-cultural adjustment. Here the form of thought was essentially
historical or evolutionary and was quite similar to the model employed in the
Menomini study (Spindler 1955). The second stratified sample was drawn along [125]
somewhat different lines, and attempted to isolate significant variations in
type of family organization (both of orientation and procreation) and patterns
of family activity. Because of certain developments in the larger study of
Klamath Reservation Culture, and especially because of a very high refusal
rate, neither of these formal approaches to sampling could be utilized.

The growing understanding of Klamath Reservation Culture gave cause to suspect
the several tentative analyses of the situation upon which these formal models

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it became
154 apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to characterize the confused orientations, the value conflicts, and the disorganized family life of persons early in their life arc, but the same persons frequently settled down to a respectable, stable "Elite Acculturated" mode of existence in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was considered, but it was apparent that the major cause for refusal was the absence of an existing friendship relation between subjects and field-worker (or some influential intermediary). Moreover, an analysis of the status of those who refused indicated that this reaction was neither confined to nor clustered within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a deliberately
representative sample of the reservation population. The criteria of representativeness included variations in social roles assumed by the subjects (occupation, sex, leadership, and so on), variations in role performance, differences
123 in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently, approached through the recommendations and aid of an intermediary, or, finally, a direct effort was made to become acquainted with a suitable subject. In all instances, an existing friend relationship proved the more successful mode of approach. For reasons to be suggested in the next section, there are few Klamath persons whose influence is both high and extensive, and, conversely, few who
123 can easily accept external imposition of controls. Thus intermediaries, whatever
their manifest status, rarely could elicit the cooperation of more than one suitable subject. The result of this effort was a set of Rorschach and Thematic Apperception Test Records, and short life-histories on a sample of fifty four persons, which sample could for the purposes of the research be considered as
128 reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there is another aspect of the field method used in the Klamath study which may be of
123 some interest. In each instance the potential subject was made aware of the intentions
of the field worker and the purposes of testing and interviewing. It
181 will be clear from the next section that the contemporary Klamath are in no relevant
sense "primitive," nor are they an isolated population. Indeed, many subjects
125 were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the clouds" or figures in rock formations. Further, most Klamath under fifty years of age are sufficiently experienced in the practices of American culture to have some personal familiarity with the "test situation," whether personality, aptitude, vocational, or intelligence. Thus there was a shared basis for this peculiar form of interaction.

114 for the field researcher and analyst were one and the same person. It then
(120) seemed potentially fruitful and appropriate to organize a collaborative effort
with an experienced psychologist, and it was at this juncture that David Levine
began participating in the research. The result of that effort is this report,
with its markedly inductive and qualitative approach.

121 Aside from an assessment of the attributes of Klamath personalities, we are,
thus, concerned with several somewhat broader questions. Because of the former,
the Psychologist has set one task as the idiographic analysis of each subject's
Rorschach record, but because of the latter concern this analysis must be con-
sidered doubly idiographic. We are at one and the same time concerned with two
kinds of wholes, each Klamath person, and the total socio-cultural setting. On
the one hand, the Anthropologist's interest lies in the relations between per-
sonality factors and the configurations of Klamath Reservation Culture, and,
thus, in Redfield's terms, in contributing to an understanding of the reserva-
(125) tion as a "unique analysed system" (Redfield 1955). On the other hand, the
Psychologist became interested in this setting because of his concern with using
the Rorschach as one measure of Ego-development, or the level of psychological
maturity. In this respect, and aside from the intrinsic interest of each, the
ten case studies are seen as a possible means of bringing to bear certain por-
tions of psychoanalytic theory and Werner's genetic psychology theory upon the
task of explaining some aspects of the styles of behavior prevalent in the pe-
culiarly stifling environments of American Indian reservations. We are, there-
fore, interested in developing useful approaches to larger problems and in
building hypotheses.

12 With respect to the division of labor, Clifton collected the original data and
was responsible for writing Sections I and II and the introductions to the case
studies, while Levine gave his attention to the analysis of each case. The con-
cluding section is a joint effort. Levine's analysis of the Rorschach records
has been without extensive foreknowledge of the characteristics of life on or
the history of the Klamath reservation, and without foreknowledge of the parti-
cular experiences or cultural status of the subjects. The collaboration of
Anthropologist and Psychologist, the inductive, case-study approach, and this
"blind" analysis thus put this report in the culture and personality tradition
most recently represented by Gladwin and Sarason's Truk study. Indeed, this
report was partly prompted by Gladwin and Sarason's recent complaint that
"...studies which would refine and carry forward this or other systematic methods
121 of case analysis have not been forthcoming." (1959: 175). While we agree that
analyses of comparative data should be made available, in all modesty we cannot
lay claim to a refinement of the case study method. Again, we are concerned
with developing useful theoretical ideas, or in finding a place to transplant an
existing idea, rather than with methodology.

122 We are indebted to Zygmunt Piotrowski for his approach to Rorschach analysis and
for suggesting the possibility of our collaborating, to Luther Cressman of the
University of Oregon for providing facilities for publication and for initial
support of the field work, and to Theodore Stern, also from the University of
Oregon, for continuing assistance and encouragement in and out of the field.
(121) Section II of this report draws heavily upon Dr. Stern's published and unpub-
lished Klamath materials, for which we are particularly grateful. During 1958,
James Clifton's field work was supported by a Social Science Research Council
Fellowship for Training in Social Anthropology, while support for the 1959 re-
search was provided by the National Institute of Mental Health in the form of a
pre-doctoral fellowship and research grant. The National Institute of Mental
Health has, additionally, financed publication costs of this report.

and the modes of behaving through which the Klamath interact with their be- 181
havioral milieu. For this reason it is not to be supposed that White exclusion- 657
ism or Agency policy alone are the significant antecedents of the stable
pluralism of reservation life. For a Klamath to leave the amorphous atmosphere
of his home or the circle of his drinking pals to enter into the unfamiliar and
unprepared-for activities of White life is a source of fear and anxiety.

Thus, however it may seem to the outsider, the existing way of life on the
Klamath reservation offers substantial predictability to tribal members, a place
to live, a corporate body with which to identify, and multiple stable human
relationships. As a cultural system it may be stable in form although changing
in detail, and therefore this novel set of human relationships is not likely
to quickly disappear. The Klamath today may not be the same persons who were [177]
settled on the reservation a century ago, and aboriginal Klamath, Modoc, and [171]
Paiute cultural attributes may have disappeared, yet they are still self-con-
sciously Indian. In studies of acculturation, it is frequently argued that groups
like the Klamath are marginal, that is, hung suspended between two cultural 181
worlds. We feel that such a metaphor is both confusing and misleading. It
assumes the presence of a reasonably intact cultural alter of aboriginal design 657
and a unilineal path of acculturation process. As indicated above, the former 121
is not present on the contemporary Klamath reservation. As to the latter, we
argue that the structural consequences of acculturation are many, and a lineal
assimilation process is only one of them. The Klamath situation, we feel, is
that of an unassimilated minority group which is itself very actively engaged in
maintaining its special position and which is subject to multiple external
pressures for maintaining its present boundaries. The Klamath are, therefore,
in a position analogous to religious and racial enclaves. They are a group
distinct from and in some ways opposed to American culture who fit, as it were,
into a special niche in the larger structure of American society. If the term
marginality is to be used with reference to any Klamath individual it can only
refer to his orientation towards conflicting reference groups in the heterogeneous
contemporary community.

Section III. Approach to the Rorschach Protocols

The interpretive approach to the Rorschach protocols was dictated to a large 121
extent by the overall purpose of the investigation. An avowedly inductive 125
and idiographic study requires a broadly clinical, not a narrowly statistical,
analysis of the obtained Rorschach responses. The conclusions reached on the
basis of this kind of research may be considered hypotheses to be tested in
controlled deductive research.

The validity of the Rorschach method for personality exploration is not at issue in the present study; there are obviously more clear-cut and efficient research methods available for that purpose. Rather, the test is being utilized as one means of gaining insights about the adaptive mechanisms of individuals in a particular sub-group that is undergoing an acculturation process — a case-study approach. These insights may lead hopefully to theoretical advances in that area of study called Culture and Personality.

From this statement of the general purpose of the research, several specific 121
methodological decisions follow. It becomes clear immediately that there will
be no comparisons of groups by statistical methods and few statistical tabula-
tions of group means and standard deviations. There will be no description of
that artificial construct — the modal Klamath personality. On the contrary,

121 the emphasis is on the unique adjustment of the individual subject to the specific life conditions he encounters and helps create.

121 125 114 The present approach to the projective tests is, then, radically different from much of the work of Hallowell, Spindler, Kaplan and other writers who at times have utilized a rigid and mechanical approach to the test data, one which often entailed group comparisons of mean scores. Their methodology makes at least three assumptions. Firstly, that single scores may be interpreted meaningfully out of the context of the rest of the record; secondly, that individual variability is not important enough to obscure group differences; and finally, that the general area under investigation has been thoroughly enough explored to justify hypothetico-deductive research methodologies. These assumptions may be warranted in some instances, but our impression is that too often this rigid methodology has been employed prematurely.

Our use of the projective tests, on the other hand, is similar to Gladwin and Sarason's in that we are unwilling, at this point, to go beyond a case-oriented, inductive methodology. However, important differences between their interpretive procedures and ours are obvious on even the most superficial inspection. While we have attempted to base as much of our interpretation as possible on Piotrowski's explicit principles of interpretation Sarason does not feel that his interpretations would be facilitated by computing a scoring summary. His position rests on the conclusion that the available "evidence" (a term he defines explicitly and rigidly) is insufficient to justify most Rorschach interpretations based on scores. However, Sarason's goals in the Trukese study included an attempt to make explicit the process by which he, as a clinician, transformed the raw data into personality descriptions. Sarason might have come closer to achieving this particular goal had he paid more explicit attention to the scoring categories. In his analyses he used extensively the initial reaction times, the number of responses, and the level of form accuracy of the responses. However, he was also acutely and continuously aware of the manner in which the subject dealt with the colored and shading aspects of the blots, as well as the extent to which movement was involved. Although we agree with Sarason that the validity of much of the interpretation based on Rorschach scores has not been demonstrated scientifically, we take the position that explicit utilization of Rorschach scores and specific interpretive principles will enable us to approach more quickly the goal of understanding the process by which the clinician goes from the raw data to the personality interpretation. In addition, there has been a considerable amount of scientific research — much of it done by Sarason and his students — which suggests that some Rorschach scores do have behavioral concomitants. Our hope is that by being explicit we can move ever closer to the goal of determining the validity of the Rorschach, while at the same time using the test for whatever inductive value it does have.

121 125 Since the focus of this study is on the subject's adaptive mechanisms, the Rorschach interpretations have been carried out in a theoretical framework which emphasizes Ego Psychology, rather than the exploration of specific instinctual energies. Scientific research and clinical opinion both indicate that this approach — emphasizing ego functions, not the probing of unconscious depths — is likely to be of greater ultimate value and rests on a surer foundation. (Klopfer, 1954; Sarason, 1954; Schafer, 1954, to mention but a few). Thus, we are less concerned with what the subject sees in the blot than in how he sees it.

[114] Piotrowski's principles of interpretation (1957), as well as his interpretive "definitions," are in accord with this orientation and generally were followed.

121 125 114 Piotrowski's stress on analyzing the percept, rather than the verbalized response (hence, perceptanalysis) is an example of his emphasis on a careful scrutiny of the manner in which the subject is approaching the task presented by the Rorschach examination. The errors resulting from a too hasty reliance on the subject's verbal report range from assuming the response "bat" to Card I is a W, when it might have been a rare detail to scoring an F- for any statistically infrequent response when a careful inquiry might have revealed an accurate, original, and well-organized percept. Ultimately, of course, we are dependent on the subject to tell us what he sees and how he is seeing it, but a sensitive, careful inquiry can help the subject communicate in words the images he has created. When our goal is an understanding of the adjustment of an individual Klamath, this attempt to see the blot as the subject sees it enables us to approach — with empathy, if you will — the subject's own manner of perceiving the blot stimulus.

However, Piotrowski's method of interpretation rests on firmer footing than this perhaps vague statement that an attempt is made to empathize with the subject. Piotrowski has stated, in explicit principles and definitions, the interpretive significance which he attaches to the various kinds of responses. Although these principles were used as guidelines, they were not adhered to in a dogmatic fashion.

125 128 For example, the Rorschachs were scored carefully, but not rigidly. An illustration of this distinction is the scoring of form level. Much has been written about this pseudo-problem; the Beck-Klopfer controversy concerning a statistical versus an evaluative basis for form-level scoring has generated much heat. The present approach may seem at first blush to beg the question, but a moment's analysis indicates that the scoring is always done keeping in mind that the ultimate purpose of the test is interpretation. Thus, if a response is clearly an F+ response, i.e., the form of the image corresponds without question to the blot area, there is no scoring difficulty. However, if the subject gives a response which is neither clearly F+ nor F- (and for Beck, is statistically infrequent), but rather gives a response which might almost be justified, but not quite, the scorer need not sit in a quandary; to my way of thinking he need indicate merely that the subject has produced a response with this kind of borderline form level. (More detailed analyses of various approaches to form level have been described by Phillips & Smith, 1954; Klopfer, 1954). If the subject produces this kind of response often, we conclude that he often responds to life in a manner which does not include a careful evaluation of the situation, but that he does not behave in an obviously idiosyncratic manner. More precise interpretations may be formulated in the specific instance, of course. Piotrowski's scoring F± for vague responses such as "clouds," "rocks," or "bays," is an example of his attempt to formalize this approach to scoring borderline responses.

121 125 [128] As a corollary to the emphasis on Ego interpretations, an attempt was made to evaluate the adequacy of the subjects' adjustment, and in the attempt, to uncover the person's strengths and assets, as well as his flaws and weaknesses. The task consisted, in part, of gauging the extent to which his particular adaptive mechanisms enable him to cope adequately with his impulses and feelings in the context of his environment — to what extent his life style meshed satisfactorily with his life space. Since the Rorschachs were interpreted by the psychologist initially without information concerning the subject's life history, this entailed a careful examination of the balance of components in the protocols themselves. In this process much emphasis was placed on the organizational quality of the responses. The research on genetic-level scoring of the Rorschach

121 (Levine, 1960) has indicated that this may be an extremely important measure
125 of ego strength. Whether this is supported in cross-cultural work remains to
[114] be determined.

121 The emphasis throughout this phase of the research has been on the functioning
15 individual — how he adapts to his environment in general and, whenever possible, how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application is often very helpful and may have led to the most important conclusion of the
156 present investigation: that the Klamath are characterized by a guarded and
[171] restrained approach to life and interpersonal relations. This guarded restraint is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

the person's being;" there are overly emotional reactions to blots: "it's terri- 159*
fying if some kind of disease attacks you." And finally all the color comment 158
indicates she is affected by the color but cannot integrate it appropriately.
Thus, she responds emotionally but cannot bring these feelings under control.
A statement of her feelings of impotence or "intellectual passivity" (Pietrowski
1950) is her comment on Card III: "But why the grasshoppers should be playing,
I don't know."

Are there any personality strengths to balance this pathological picture? Just 159*
the six popular responses. These are liberally sprinkled throughout the record. 157
We would have to conclude then that she is generally able to respond in a socially
acceptable and conventional manner. However, the somatic preoccupations and
poor emotional control are evident throughout. She seems to make an effort to
maintain satisfactory relations with others. She is ready to accept responsi-
bility for difficulties ("You know my trouble is I don't read very much"); al-
though distanciated, her second M response is the pleasant "grasshoppers playing;"
she does respond positively to the "lovely coloring." However, these are all
based on content, rather than determinants, and as such are probably much more
superficial indicators.

This personality description would not be complete without at least some comment 121●
concerning the possible influence of the age of the subject and the role expec- 888
tations of this age group among the Klamath. Since this analysis has been done
without the benefit of this latter information, it can only be remarked that, to 157
the extent that elderly people are allowed greater latitude in their behavior,
to that extent this woman's adjustment will be considered acceptable, rather
than pathological. In any case, however, she is probably terrified by disease
and death. One wonders if the change in cultural attitudes toward disease and
death may have left her bereft of a set of beliefs which might have helped her
at this point in her life.

*159

157 There are no indications of peculiar thinking or intellectual impairment, but the total absence of color responses does reflect a poverty of emotional responsiveness. She appears to be a laconic, taciturn youngster. Her free associations are stated briefly and not spontaneously elaborated.

157
156
[154]
The Rorschach gives us, then, the picture of a stereotyped, overly conventional adjustment. She is a "good" girl who does what she is told and uses her fantasy to gain the little instinctual gratification she gets. The fact that her smile comes as she is describing "teenagers dancing" suggests that, like most youngsters her age, peer relationships are particularly important to her and that this is not an area of particular threat. It is probably the male authority figure who is her difficulty.

*159

156
177
[121]
This protocol contains the first overt comment concerning an acculturation process. One can perceive her distance from her father in her discussion of R10: "...it's supposed to get whoever they sing for well." Her objectivity here indicates that she is a part of the generation which is undergoing acculturation. She can apparently look, with distance, at her father's tribe's customs. One wonders to what extent this cultural change is a factor in her difficult relations with her father, or whether — with Freud — it's the "universal Oedipus complex" we see here.

[121] This is a conventional record to the point of constriction: 5 or 6P; F plus percent adequate; several M; no major shocks. Only the absence of color responses stands out. We are left with the question of how and why this youngster has buried her feelings so completely? Although this is a brief record, we hazard the guess that it is the stress of acculturation which has created the overcontrol which characterizes this girl's adjustment (R10).

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all aspects of the preceding case studies we intend to pursue some of the implications of certain striking characteristics of Klamath personalities. Aside from this descriptive effort we also intend to derive, hypothetically, an association between these personality attributes and Klamath acculturation experiences. 121

Certainly the most pervasively shared attribute of Klamath personalities is the one we have chosen to call guarded restraint. This label is intended to designate the general attitude towards self and interpersonal relationships which has emerged from the analysis of Rorschach records, life-history materials, and observations of behavior. Guarded restraint, therefore, may be taken to mean the prevalent suspicious and guarded attitude towards life of the Klamath subjects, their wariness as regards significant others, and their apprehensions as regards their environment generally. This attribute, as we conceive it, has many facets. It includes an unconscious as well as a more deliberate muting of responsiveness to the actions and the mere presence of others, a shallow, non-committal attitude towards membership in various social groups and the goals of these groups, and a characteristic which ranges from simple lack of trust to outright fear of the behavioral milieu. 156 157 [12]

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem somewhat ambiguous. The empirical referents on the level of observable behavior are, however, highly visible. They may be observed in a wide variety of behavior settings, from the informal and unstructured relations within a teenage clique or an adult drinking group to the more organized setting of the family and household. 121

The psycho-cultural phenomena we have labeled as guarded restraint over-laps with what others have called Klamath individualism. Seen in this perspective, we may, perhaps, introduce a somewhat richer way of analyzing and gaining insight into the nuances of Klamath behavioral styles. This approach is, we hope, something more than just a different way of looking at the manifest separatism and incohesiveness of family groups, a more fruitful manner of examining the atomistic structure of Klamath reservation sodalities, and a means of appreciating the psycho-dynamic causation of the constant fractionation of Klamath political groupings. The evidence of these case studies, then, suggests that few Klamath are capable of fully identifying with other persons or of committing their loyalties to concerted group action. 121 157 [156]

We feel that this major descriptive conclusion is, in large part, a product of the case study method used in analyzing the Rorschachs. Moreover, it is our belief that this conclusion could not have been obtained from an analysis of a composite psychogram based on formal scores. As anyone who has ever read reports based upon the statistical or modal personality approach well knows, such reports are ridden with dynamic cliches and are largely sterile until filled out with examples of the qualitative features of individual records. In this report Levine has entirely discarded the lumping of group scores and concentrated upon an analysis of qualitative features of individual records buttressed and supported by the use of formal scores and relationships. The importance of this approach is shown by the fact that the reserve and guardedness that characterizes Klamath does not always show up in individual test records in the same form. Most frequently an important clue is had from the presence of restrained, watchful, wary figures in human and animal movement responses. Indeed, this type of movement 125 128 [157]

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[192] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[24]

One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, interests,
156 or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another characteristic
of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath seldom
[125] have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
657 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insulation
[158] of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
158 In the instance of Slim, for example, we find that a superficially adequate adjustment
may simply be the manifestation of an obsessive control over and reduction
[121] of emotional and intellectual processes to the point of a tentative diagnosis
of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are
examples of extremely loose, unrealistic and disorganized thinking with overtones,
in some instances, of an almost paranoid suspiciousness, or a reliance
upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic
role or personna which is very poorly integrated with the rest of the personality
is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's
superficial warmth. We suggest that these more disordered aspects of adjustment
may profitably be seen, in part, as a function of a generally poor contact with
others, reduced insight into the self and others, and extensive social isolation.
The mediating difficulty may well be a relative absence of opportunities to validate
beliefs and convictions. Thus in many respects adaptive, Klamath guarded
restraint probably serves as a precipitating factor in thinking disorders, sociopathic
adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

analysis of 53 Klamath Rorschachs and 33 Thematic Apperception Tests, with 128
additional evidence derived from participant observation and life history data [127]
(Clifton 1960). Moreover, the assessment agrees, in large part, with the ob-
servations and conclusions of other field workers working independently. The
significant point is that Levine, working blind from records of persons he has
never observed has reinforced and expanded upon previous evaluations of Klamath
character.

A second hypothesis about the Klamath which arises from our study — an hypothesis 121
of which we are less certain when compared with the observation that they are
a people who may be viewed as guarded and restrained — is the finding that "in 157
the total kin network the influence of the male is weak..." and "whether or not 562
there is a male attached to the household group, the wife-mother is usually the
power figure." This finding, based on the anthropological data, is theoreti- [156]
cally congruent, almost startlingly so, with the fact that the more imaginative,
creative, rich — healthy, if you will — Klamath Rorschach records were produced
by the women in the sample, while the men's records were typically stereotyped
and constricted, and often unrealistic, disorganized or suspicious. The statis- [127]
tical comparisons (Clifton 1960) as well as the individual Rorschach analysis
(Chapter III) convey this impression very clearly. [128]

The importance of these findings can be viewed profitably in the light of con- 121
temporary psychoanalytic theory, especially in relation to the concepts of iden-
tification and modeling in child development. The theory holds that the child
identifies with, i.e., adapts the characteristics, attitudes, and values, of his
parents because he envies them; they are the powerful people who receive the
rewards and gratifications which he is denied. In classical psychoanalytic theory,
the boy is said to identify with the father because the father is the power figure
in the family and receives the love of the mother. Although Freud never was as
content with his psychology of women as he was with the Oedipus Complex, pre-
sumably similar processes account for feminine psychology. The classical Oedipus [128]
Complex has been modified in order to integrate more satisfactorily with cross-
cultural data, and it is in this more flexible framework that the present re-
sults can be understood best.

In those societies in which the father is not a stable, respected member of the 121
family the process of identification is not as straightforward: the growing boy
does not want to be like his weak father; he cannot identify with an absent
father figure; yet he is biologically unable to be like his mother. The theory
holds that his identification as a person will not be well integrated or complete.
In the Klamath family, the mother is the stable figure, the one who commands the 121
boy's respect. Since a consistent and integrated identification is needed for a 156
healthy development of the ego, we are not surprised to find that the males in
our Klamath sample show signs of poor ego structure. The women, on the other 562
hand, come off much better and one may hypothesize that they are able to make a
more integrated identification with the wife-mother figure in the Klamath family. 593

It may be necessary for a well-stated theoretical position to distinguish between 121
two qualities of the parent which are confounded in the present discussion: sta-
bility of the model on the one hand and the extent to which the parent receives
rewards, on the other. The general theoretical position, however, states that
those societies in which the father is more stable, receives more of the respect
and material reward, or is more powerful will be societies in which the boys can
establish their roles more readily. On the other hand, in groups like the Klamath, 121
in which the father is weak or absent, we can expect to see signs of role conflict, 156
562
593

•121
156 vague identification and, since it is largely through identification that the
562 super-ego is established, weak super-egos.

593 It has been suggested that what we have called guarded restraint may be a "front"
121 maintained only when Klamath are interacting with whites. The point is that
156 guarded restraint may be another name for the extreme suspicion and reserve of
many enclaved or colonized minority groups vis-a-vis representatives of the
177 dominant culture (Underhill 1960). It cannot be denied that, in fact, reserve
[191] and suspicion do characterize much of the relationship between Klamath and Whites,
but the reserve and restraint which so characterize Klamath persons is not solely
a function of such situations. We agree that guarded restraint is one important
consequence of acculturative contacts, but the evidence of observation and life
histories clearly indicate that this is a personality attribute manifest in many
[829] situations exclusive of the presence of outsiders. Life history subjects, for
example, speak of the "Indianness" of their parents, meaning precisely an aloof, reserved style of interaction. Many other informants verbalize reactions to the endemic if latent suspiciousness of Klamath life. Thus guarded restraint is not purely an observer construct with a referent limited to the test situation. Certainly, a measure of reserve and suspicion may serve utilitarian functions when interacting with strangers, but the same characteristic makes strangers out of neighbors.

121 Underhill's suggestion does raise the issue of a broader connection between
156 guarded restraint and the impact of acculturation. If there is such an association then we should expect to find these attributes widely distributed among
177 other acculturated populations, especially those which have been exposed to the
171 imposition of external political and administrative controls, and deculturation
or detribalization. That there may be some validity to this hypothesis is sugges-
157 ted by the fact that attempts to communicate our findings to observers with experience among other acculturated populations frequently evoke memories of similarity in character. What we have called guarded restraint has been suggested as characteristic of the contemporary Southern Ute (Stewart 1961) and especially the Mountain or Towoac Ute (Canan 1961), and of the Cree, Northern Athabascan, and Eskimo (Heinrich 1961). In each instance there are differences, but differences which seem to play upon a common theme.

Personality attributes analogous to what we have called guarded restraint have repeatedly been discerned among other more or less acculturated North American Indian populations. Thus Barnouw describes the Wisconsin Chippewa as emotionally isolated, suspicious of outsiders, and fearful of expressing emotions overtly (Barnouw 1950: 22-23). Klopfer's analysis of Chippewa Rorschachs suggests that "...the individual is under pressure to become as emotionally independent of his environment as possible, and to expect very little from others." (Barnouw 1950: 27). The Ojibwa have been described as emotionally restrained, suspicious, and anxious (Hallowell 1955: 350). Hallowell's interpretation of these characteristics is that they constitute persistent aboriginal components of Ojibwa character structure. In a similar fashion, the Native-Oriented Menomini have been described by Spindler as a group characterized by a non-defensive reduction of emotional display, whose perception is narrowed to only a very selective portion of their environment, and who are further characterized by a non-manipulatory passivity. Outside of the presumed character structure of the Eastern Woodlands, the most widely distributed "aboriginal" characteristics of North American Indians, generally, are given by the Spindlers as non-demonstrative emotionality, great reserve, individual autonomy, and a generalized fear of the world as dangerous (Spindler and Spindler 1957: 148).

On the face of these parallel descriptions it would seem that the Klamath are 121
similar, as regards guarded restraint, to a variety of differently situated, 156
differentially acculturated North American Indian populations, populations with
diverse cultural heritages. These similarities are, of course, susceptible to 157
different explanations. It would be a simple matter, for example, to explain 171
away the similarities as false, that is, as being a function of unreliable tech-
niques of assessment and highly ambiguous descriptive constructs or constructs 177
lacking in validity. Aside from being no explanation at all, this approach would [114]
involve discarding most of the available cross-cultural psychological data as
well as existing assessments of the personality dynamics of North American Indians.
Although this is the course advocated by many methodological puritans in the area
of culture and personality research we choose to accept the similarities as valid.

A second way of explaining these similarities might invoke the assumption of an underlying "North American Indian" character structure or basic personality analogous to Devereux's delineation of a core personality type for the Plains (Devereux 1951). Accepting this assumption the persistence of core traits must then somehow be accounted for. In the instance of the Plains, Devereux presents one possibility, namely that acculturation has resulted in a "stripped-down" and impoverished personality type (Devereux 1951: 25). Somewhat differently, Hallowell and his followers have argued that basic personality somehow manages to weather the vicissitudes of history and acculturation (Hallowell 1955: 309;
Spindler 1955: 151). The common feature of both of these explanations is the [114]
assumption of an underlying, basic set of psychological characteristics linked to aboriginal prototypes and common to the population occupying a given culture area.

In the instance of the Klamath there is very little evidence to suggest, un- 121
equivocally, that guarded restraint was a dominant component of aboriginal char- 156
acter structure. The information is scanty and points to the definite presence
of great reserve and considerable suspicion, but only as one mode of interper- 157
sonal relations among others. Moreover, the Klamath reservation situation does 177
not allow a comparison of differentially acculturated groups after the model
used by Hallowell for the Ojibwa, and the effort to apply Spindler's technique [657]
of an internal comparison raised more problems than it resolved in this setting.
Finally, the evidence from the Klamath psychological data indicates that, if [171]
anything, older members of the tribe are less reserved and suspicious. In short,
we cannot assert from available evidence that guarded restraint was basic or
dominant in aboriginal Klamath character structure. We suggest that at minimum
this characteristic was present, but that it did not receive the emphasis it
now gets.

Aside from this difficulty, there are a great many conceptual problems associated 121
with the postulation of an underlying, basic trait of guarded restraint for the
North American Indians generally. We feel that it is stretching the point to 156
attempt to account for present similarities among unrelated cultures of such 157
different cultural heritages with a construct so broad. Due to the absence of
firm measures of aboriginal character structure this approach to explanation also 171
involves substantial methodological problems which are not easily resolved.

Instead of explaining contemporary similarities in either of these ways it is 121
possible to view modern Indian populations in the light of common acculturative
experiences and their status as dependent wards, as enclaved minority groups, 156
and as persons who have been promised much but who have attained little. Spindler 157
has suggested that when acculturation conditions permit both a ready identification 171
177

121 with the values of the dominant culture and provide access to the institutionalized
156 means of attaining desired goals there will be a successful psychological
157 adaptation to dominant standards, but that when these conditions do not exist
then there may be overt change in the content of culture unaccompanied by changes
171 in psychological characteristics (Spindler 1955: 199). In the same way, Hallowell
177 suggests that constant association with powerful external agents, multiple
conflicting sources of reward and punishment and the ridicule and invidious comparisons which too frequently accompany acculturation situations may result in extreme feelings of insecurity, personality maladjustment, and what he calls the "frustration of maturity" (Hallowell 1955: 329).

Spindler's dual hypotheses are, of course, not the only alternative consequences of acculturation situations. We feel that between these polarities there are different modes of adaptation open, modes similar to those suggested by Hallowell.
[178] We therefore assert, hypothetically, that the defensive, guarded, reserved style of interaction now characteristic of the Klamath is the product of the deterioration and decay of major patterns of aboriginal Klamath culture, a prolonged exposure to and considerable identification with the values and standards of the dominant White society, and the persistent denial of access to the means and instrumentalities necessary to achieve these goals and to live up to the standards. We argue, in this way, that there are a great many similarities between diverse American Indian populations as noted by many observers, that these similarities do not constitute the residue of generic Indian character traits, but that they are a function of a common depressed minority group status within contemporary American society. Our analysis of this is that these components, specifically, the guardedness, the reserve, the suspicion, and the lack of involvement in creative group activity, are very much analogous to what various sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957; Seeman 1961).

LETTER OF TRANSMITTAL.

SMITHSONIAN INSTITUTION,
BUREAU OF ETHNOLOGY,
Washington, D. C., June 25, 1890.

121 SIR: I have the honor to transmit to you my report upon the Klamath
Indians of Southwestern Oregon, the result of long and patient study. It
deals with their beliefs, legends, and traditions, their government and social
life, their racial and somatic peculiarities, and, more extensively, with their
126 language. To this the reader is introduced by numerous ethnographic
124 "Texts," suggested or dictated by the Indians themselves, and accompanied
by an interlinear translation and by "Notes," a method which I regard as
the most efficient means of becoming acquainted with any language. In
121 this report I have given prominence to the exposition of the language,
128 because I consider language to be the most important monument of the
American Indian. Archæology and ethnography are more apt to acquaint
us with *facts* concerning the aborigines, but language, when properly investigated, gives us the *ideas* that were moving the Indian's mind, not only
recently but long before the historic period.

Repeated and prolonged visits to the people of the northern as well as
of the southern chieftaincy have yielded sufficient material to enable me to
classify the language of both united tribes as belonging to a distinct family.
101 In their territorial seclusion from the nearer Indian tribes they show anthropologic differences considerable enough to justify us in regarding them as
a separate nationality.

197 There is probably no language spoken in North America possessed of a nominal inflection more developed than the Klamath, although in this particular, in the phonetic elements and in the syllabic reduplication pervading all parts of speech, it shows many analogies with the Sahaptin

GEOGRAPHY OF THE KLAMATH HIGHLANDS.

121 The first part in the historical and social study of a tribe or nation must be a thorough examination of the country and of the climate (in the widest sense of this term) in which it has grown up, for these two agencies give character to peoples, races, languages, institutions, and laws. This principle applies equally to the cultured and to the ruder or less developed populations of the globe, for none of them can possibly hold itself aloof from the agencies of nature, whether acting in a sudden manner or gradually, like the influences of climate. The races inhabiting coasts, islands, peninsulas, jungles, plains, prairies, woodlands, foot-hills, mountains, and valleys differ one from another in having distinguishing characteristic types indelibly impressed upon their countenances by their different environments. That upland and mountaineer tribes have made very different records from those of nations raised in plains, lowlands, on coasts and islands is a fact of which history gives us many well-authenticated instances.

177 bury their dead instead of cremating them, and commence to acquire a smattering of English. Indian superstitions, conjurers' practices are not abandoned before the white man's ways have wrought a thorough change in their minds; and a regular school attendance by children can not be expected before this stage of progress has been reached.

157 [721] In his moral aspects the Klamath Indian is more coarse and outspoken than the white man, but in fact he is not better and not worse. He has attacked and enslaved by annual raids the defenseless California Indian simply because he was more aggressive, strong, and cunning than his victim; his family relations would be a disgrace to any cultured people, as would also be the method by which the chiefs rule the community. But the passions are not restrained among savages as they are or ought to be among us, and the force of example exhibited by Indians of other tribes is too strong for them to resist.

121 157 The character of men in the hunter stage depicts itself admirably well in the mythic and legendary stories of both chieftaincies. Low cunning and treacherous disposition manifest themselves side by side with a few traits of magnanimity hardly to be expected of a people formerly merged in a sort of zoolatric fetichism. There is, however, a considerable power of imagination and invention exhibited in these simple stories, and many of the ferocious beasts are sketched in a truly humorous vein.

Man's morals are the product of circumstances, and the white man who judges Indian morals from the Christian standard knows nothing of human nature or of ethnologic science. The moral ideas of every nation differ from those of neighboring peoples, and among us the moral system of every
000 century differs from that of the preceding one. The fact that the Modocs showed themselves more aggressive and murderous towards the white element than the Klamath Lake Indians may thus be explained by the different position of their homes. The latter being more secluded have not molested Americans sensibly, whereas the annals of the Modocs, who lived in an open country, are filled with bloody deeds. They are of a more secretive and churlish disposition, and what Stephen Powers, who saw them shortly after the Modoc war, says of them is, in some respects, true: "On the whole,

000 they are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can deny."*

THE PREHISTORIC PERIOD.

174 Before the middle of the nineteenth century the Máklaks people was unknown to mankind except to the nearest neighbors in Oregon and California. We are therefore justified in beginning its period of documentary history at that time, and in relegating to the domain of prehistorics all that is known of their previous condition. The information upon these points is furnished by three factors: tradition, archæologic remains, and language.

A. TRADITION BEARING UPON HISTORY.

121 773 Traditional folk-lore, when of the mythic order, generally dates from an earlier epoch of fixation than historic traditions. The remote origin of *genuine* mythic folk-lore is sufficiently evidenced by the archaic terms embodied with it, by the repetition of the same phraseology for ages, and by the circumstance that all nations tend to preserve their religious ideas in an unchanged form. I am laying peculiar stress upon the term *genuine*, for Indians have often mixed recent ideas and fictions with archaic, original folk-lore and with ancient mythic ideas, the whole forming now one inextricable conglomerate which has the appearance of aboriginal poetic prose.

173 769 688 171 784 The Klamath people possess no historic traditions going further back in time than a century, for the simple reason that there was a strict law prohibiting the mention of the person or acts of a deceased individual by *using his name*. This law was rigidly observed among the Californians no less than among the Oregonians, and on its transgression the death penalty could be inflicted. This is certainly enough to suppress all historic knowledge within a people. How can history be written without names?

[126] Many times I attempted to obtain a list of the former head chiefs of the two chieftaincies. I succeeded only in learning the names of two chiefs recently deceased, and no biographic details were obtainable.

174 This people belongs to the autochthonic nations of America, called so because they have lost all remembrances of earlier habitats or of migrations.

---

* Contributions to Amer. Ethnology, III, p. 253.

172 shores of Goose Lake, chiefly at Davis Creek, a number of stone mortars
312 are found, fashioned with a sharp point to be inserted into the ground, and that in former times Modoc, Payute, and Pit River Indians contended in many bloody battles for the possession of this thickly inhabited country, though none of them could obtain any permanent advantage.* Since the manufacture of this kind of mortars can not be ascribed with certainty to the Modocs, we are not entitled to consider them as antiquarian relics of this special people. The three sudatories and the river barrages are regarded as the gifts of Kmukámtch, a fact which testifies to their remote antiquity. Excavations (wásh) forming groups are found on many of the more level spots on the Reservation, near springs or brooks. They prove the existence of former dug-out lodges and camps.

C. LINGUISTIC AFFINITIES.

121 Anthropologic researches upon the origin of a people do not always
197 lead to decisive results as to the qualities of the primitive race of that people, for the majority of all known peoples are compounds from different races, and thus the characteristics of them must be those of a medley race. As to antiquity, language is second to race only, and much more ancient than anything we know of a people's religion, laws, customs, dress, implements, or style of art. Medley languages are not by any means so frequent as medley races, and less frequent still in America than in the eastern hemisphere; for in this western world the nations have remained longer in a state of isolation than in Asia and Europe, owing to the hunting and fishing pursuits to which the natives were addicted—pursuits which favor isolation and are antagonistic to the formation of large communities and states. This explains why we possess in America a relatively larger number of linguistic families than the Old World when compared to the areas of the respective continents. It also explains why races coincide here more closely with linguistic families than anywhere else on the surface of the globe. Instances when conquering races have prevailed upon other nations to abandon their

---

* Contributions to North Amer. Ethnology, III, p. 252. Davis Creek enters Goose Lake from the southeast. The U. S. Geological Survey map marks "Old Indian Villages" in latitude 41° 37′ and longitude 120° 36′, to the southwest of that basin.

121 own languages are scarcely heard of on this hemisphere, but the annals of
197 the eastern parts of the globe make mention of such.

Whenever it is shown that the language of some American people is akin to the language of another, so that both are dialects of a common linguistic family, a more cogent proof of their common genealogic origin is furnished than lies in a similarity of laws, customs, myths, or religion. To decide the question of affinity between two languages is generally an easy, but sometimes a very difficult task. When a relatively large number of roots and affixes having the same function coincide in both, this argues in favor of affinity. The coincidence of single terms in them is never fortuitous, but we have to find out whether such terms are loan words or belong to the stock of words of the languages under process of investigation. Other terms show an external resemblance which is not based on real identity of their radicals, but only on a deceptive likeness of signification.

From all this the reader will perceive that we can not expect to steer clear of shoals and breakers in determining by the aid of language the affinities of our Klamath Indians. But the inquiries below, whether successful or not, will at least aid future somatologists in solving the problem whether linguistic areas coincide or not with racial areas upon the Pacific coast between the Columbia River and the Bay of San Francisco. In making these investigations we must constantly bear in mind that the track of the migrations was from north to south, parallel to the Pacific coast, which is sufficiently evidenced by the progress of some Selish, Tinné, Sahaptin, and Shoshoni tribes in a direction that deviates but inconsiderably from a meridional one.

To establish a solid basis for these researches, a list of the Pacific coast linguistic families is submitted, which will assist any reader to judge of the distances over which certain loan words have traveled to reach their present abodes. The country from which a loan word has spread over a number of other family areas is often difficult to determine, because these languages have not all been sufficiently explored. The families below are enumerated according to the latest results of investigation. Some of them may in the future be found to be dialects of other stocks. The Californian tribes have been mapped and described in Stephen Powers's "Tribes of California"; Contributions to North American Ethnology, Vol. III.

121 The *Shoshoni* family extends through eastern Oregon, Nevada, southern
197 Idaho, Utah, parts of Wyoming and California, and embodies the tribes of the Snake Indians, the Shoshoni, from whom the Comanches separated centuries ago, the Paviótso and Bannok (Panaíti), the Pai-uta, Uta, Móki, and the Kawúya branch of California. This family occupies an area almost as large as the Selish stock, but the population is very thinly scattered over the vast territory of the inland basin.

Washo Indians, near Carson, Nevada, inclosed on all sides except on the west by Shoshoni tribes.

Selish Indians occupy Washington, portions of the Oregon coast and of Vancouver Island, northern Idaho (from which they extend into Montana), the Fraser River Valley, and the adjoining coast of British Columbia. Some dialects of this family are remarkable through a profusion of consonantic clusters. *Chinook* dialects show many Selish affinities.

Sahaptin family, dwelling around middle Columbia and Lower Snake River. An offshoot of it—the Warm Spring Indians—settled in Des Chutes Valley, Oregon.

Wayíletpu is a Sahaptin name given to the Kayuse people on the Yumatilla Reservation, which has abandoned its former tongue, called the "Old Kayuse," to adopt the Yumatilla dialect of Sahaptin. Molale is related to old Kayuse; its former area was east of Oregon City.

Tinné or *Athapaskan* tribes, wherever they appear near the Pacific coast, are intruders from the northern plains around Mackenzie River and the headwaters of the upper Yukon. Those still existing on the Pacific coast are the Umpqua and Rogue River, the Húpa and Wailáki Indians, whereas the Tlatskanai and Kwalhioqua have disappeared.

The following three families on and near the Oregon coast were explored by Rev. Owen J. Dorsey in 1884 (Amer. Antiquarian, 1885, pp. 41, 42):

Yákwina, subdivided into Alsí', Yakwina on the bay of the same name, Kú-itch on the Lower Umpqua River, and Sayusla.

Kus, Coos Indians on Coos Bay and Múlluk on Lower Coquille River.

Takilma or Takelma Indians, south of the Kus, on middle course of Rogue River.

121 197 The *Kalapuya* Indians once occupied the entire Willámĕt River Valley save its southeastern portions. Its best studied dialect is Atfálati, also called Tuálati and Wápatu Lake.

On the lower Klamath River, California, and in its vicinity, there are four tribes of small areas speaking languages which require further investigations to decide upon their affinities. At present their languages are regarded as representing distinct families, as follows:

Ara, Ara-ara or Karok, on both sides of Klamath River.

Alíkwa or Yurok, at the mouth of Klamath River.

Wishosk or Wiyot, on Humboldt Bay.

Chimariko or Chimalákwe, on Trinity River and environs.

The *Pomo* dialects are spoken along the California coast and along its water-courses from 39° 30′ to 38° 15′ latitude.

Yuki dialects were spoken in the mountains of the Californian Coast Range upon two distinct areas.

Wintún (from witú, wintú *man, Indian*) is spoken in many dialects upon a wide area west of Sacramento River from its mouth up to Shasta Butte.

Noja, spoken near Round Mountain, Sacramento Valley.

Maidu (from maídu *man, Indian*) dialects are heard upon the east side of Sacramento River from Fort Redding to the Cósumnes River and up to the water-shed of the Sierra Nevada.

Shasti dialects properly belong to the middle course of Klamath River and to the adjoining parts of Oregon; the language of *Pit River* or Achomawi, southeast of the Shasti area, is cognate with it.

Mutsun dialects, north and south of San Francisco Bay, are cognate with the Miwok dialects, which are heard from the San Joaquin River up to the heights of the Sierra Nevada. The littoral family of the *Esselen* is inclosed upon all sides by the Mutsun dialects. We have vocabularies from the eighteenth century, but its existence as a *separate* family has been put in evidence but lately by H. W. Henshaw in American Anthropologist, 1890, pp. 45–50.

RADICALS WHICH KLAMATH HOLDS IN COMMON WITH OTHER FAMILIES.

121 197 A number of radical syllables occur in the same or in cognate significations in several linguistic families of the Northwest, and some of them extend even to the stocks east of the Rocky Mountains and of the Mississippi River. This fact is of great significance, as it proves certain early connections between these Indians, either loose or intimate. If the number of such common radices should be increased considerably by further research, the present attempt of classifying Pacific languages into stocks would become subject to serious doubts. From the quotations below I have carefully excluded all roots (and other terms) of onomatopoetic origin. I have made no distinction between pronominal and predicative roots, for a radical syllable used predicatively in one stock may have a pronominal function in another family

193 197 **-im,** *-ĕm, -am, -m* frequently occurs as a suffix for the possessive case in the Pacific coast languages. Thus in Klamath -am is the usual suffix of that case, -lam being found after some vowels only; cf. Grammar, pages 317 et seq., and suffix -m, page 355; also pages 474–476. On page 475 I have called attention to the fact that -am occurs as marking the possessive case in the Pit River language; itóshĕχam yánim *deer's foot-prints;* -am, -im in Molale: pshkaínshim, possessive of pshkaínsh *beard.* The Sahaptin dialects use -nmi, -mi, etc., to designate this case.

ka occurs in many languages as a demonstrative radix, though it often assumes an interrogative and relative signification and changes its vocalization. In Apache-Tinné dialects it is interrogative: χáte *who?* in Návajo; in the Creek ka is the relative particle, a substitute for our relative pronoun *who.*, In Yuki kau is *this* and *there;* in Yókat (California) ka- occurs in kahama *this,* kawío *here,* yokaú *there.* East of Mississippi River we have it in Iroquois dialects: kĕ'^{n} in kĕ'^{n}t'ho *here* (t'ho *place*); in Tuskarora: kyä' *that* or *this one* (pointing at it), kyä' nä^n *this one;* t'ho i-kän *that one is.*[*] In the Klamath of Oregon this root composes kánk *so much,* káni *somebody,*

---

[*] My authority for quotations from Iroquois dialects is Mr. J. N. B. Hewitt, of the Tuskarora tribe.

NATURAL PHILOSOPHY.

121 In the manner of considering the transcendental world and in viewing the problems of the supernatural we perceive enormous differences among the various races of mankind. These differences mainly arise from the degree of animism and anthropomorphism applied to the deities supposed to represent the powers of nature and to rule the world. The primitive man regards everything showing life or spontaneous motion as animated by a spirit and endowed with certain human faculties; whereas among the more advanced nations these same gods and genii appear more fully anthropomorphized, and their moral and intellectual attributes more accurately defined. In monotheism all the physical and moral powers supposed to rule the universe become unified into one "Supreme Being."

A people's religion always rests upon a basis laid down in remote ages, and faithfully depicts the intellectual and moral qualities of its spiritual leaders at that period. Were they ferocious and cruel, the gods whom they imposed upon the people are barbaric also; were they kind and mild-mannered, then their deities show these same mental qualities. Deities act by miracles, and are miracles themselves; for a miracle or act contravening the laws of nature is the only causality which the mind of primitive man is able to imagine to solve the difficult problems of physics, meteorology and other processes of nature As there is no connected system in any of the savage religions, it is by no means difficult to overthrow the beliefs of a primitive people and to substitute others for it, provided the new ones are resting upon the same fundamental principle of spirits, deities and miracles. Dreams are to the savage man what the Bible is to us—the source of divine revelation, with the important difference that he can produce revelation through dreams *at will.* The more thoughtful religions of Asia establish a thorough distinction between spirit and matter, and thus dualistically establish idealism as opposite to materialism; but in America no religion goes any further than to *attempt* such a distinction. The higher Asiatic religions establish priesthoods, idols, ceremonial worship, divine oracles, prayer and sacrifice, and attempt to elevate man's character by moral teachings; here in the western hemisphere ceremony is magic and

121 witchcraft only, religious feasts are orgies, divine revelation is human hallucination, and the moral element, when present in religion, is not urged upon the community. While in the religions of the white man the gods originally representing nature's powers gradually become teachers or examples of morality and mental improvement, those of the other races remain the stern and remorseless deities of the sky, the atmosphere, and the earth, whose good will has to be propitiated by sacrifice.

As zoodemonism is the most appropriate form of religion for man in the animistic stage, the majority of the mythic characters in American religions are animals, especially quadrupeds; and even the fully anthropomorphized deities sometimes assume, in Oregon and elsewhere, the masks of animals. The earlier Indians firmly believed that such animals as were the prototypes of their own species had human faculties, and talked and thought as men do; in whatever tribe there are totemic gentes or clans the members of these are supposed to have descended from that prototype of a bear, deer, alligator, eagle, or whatever animal a gens is called after. Certain qualities of man, physical and intellectual, found their closest analogies in those of animals, and the animal world is much nearer akin to man in the mind of the Indian than in the white man's mind. Scurrilous and grotesque acts ascribed to so many Indian deities were not intended for derision, as with us, but for faithful portrayings of the habits of typical animals; and zoodemonism—not exactly zoolatry, as in Egypt—is the form of religion existing among the *wild* Indians of America.

The large amount of mythologic and transcendental material obtained among the Indians requires subdivision into several chapters. I present it under the following subdivisions: *a.* Elementary deities; *b.* Spirit deities; *c.* Animal deities.

114
124 Of the mythologic data embodied in the present article the larger part were obtained by myself, but not all. The others were gathered by Messrs. Stephen Powers and Jeremiah Curtin, mainly by the latter, who obtained over one hundred Modoc myths in 1883 and 1884, now forming part of the unpublished collection of the Bureau of Ethnology.

773 reputed to be a relative (shá-amoksh) of Marten, and consequently of
825 K'múkamtch; he stayed at the lodge of the five Thunders at the time when it was burnt down, pp. 112. 113. One of his residences is at Mount Shasta.

Other quadrupeds frequently mentioned in these stories are the *skunk* (tchàshash), the three different kinds of *deer*, the *antelope* (tché-u), the *elk* (vû'n), the *mole* (mû'nk, Mod. mû-úe). Men or Indians appear but incidentally in beast stories, as pshe-utíwash, a plural noun, and are engaged only as a passive element in every occurrence where they are mentioned.

Among the *birds* the most prominent part is assigned to the *raven* (Kák, Kákamtch), for he is *Fate* personified, and his office is to punish by death all those who act antagonistically to his or his allies' interests. This is done by changing them into rocks. In all nations the croaking, doleful cries of the raven leave a deep impression on the human mind, and hence in mythology the raven fulfills the function of a soothsayer and messenger of woe. In British Columbia and farther to the northwest he is (as Yehl) considered the creator of all organisms, and almost all the folklore centers around him as the main figure.

The *golden eagle* or the one "floating in the skies" (P'laíwash) is in the Klamath lore mentioned as often as the raven, either alone or as a family of five brothers, but does not command so much respect as the raven does.

The *water birds*, as cranes, ducks, geese, coots, form the light infantry of the mythologic make-up, and mostly figure in crowds of five or ten, the coot representing the Ojibwē Shíngibis so well known through Longfellow's Hiawatha. Some of the *lower organisms* rise to an unexpected dignity, like the woodtick or shkō'ks, which becomes the wife of the tricky Marten, and a caterpillar of beautiful colors, whose exterior makes him the rival or "master of the sun" (shápsam ptchíwip). Aíshish counts among his plural wives two butterflies of the gayest colors.

PRINCIPLES OF MYTHIFICATION.

121
77 The idea that every phenomenon and every change observed in nature and mind is caused by some spirit, ghost, genius, god, or other mysterious, generally invisible agent, embodies what we call animism, and forms the foundation of all religions of the world, however abstract they may have

121 77 become in course of time. The working of animism can best be traced in polytheism and polydemonism, in the shamanistic ideas as well as in the religious. The principles traceable in the myth-making of the Klamath Indians, which differs in some points from those of other Indians, may be summed up as follows:

The sky-gods, as sun, moon, winds, thunder, etc., here as elsewhere surpass in importance and strength the other deified powers of nature, for "theology is meteorology." Some of these chief gods assume the mask of animate beings and inanimate things when they appear among men.

773 776 Creation myths do not generally mention the material from which or the mode by which objects were created, but simply state that K'múkamtch produced them by his thinking and will power.

The spirit, life, or heart of a deity is made distinct from the deity itself and can live at a distance from it. Cf. the pipe of K'múkamtch burnt in the fire, which in another myth figures as a small ball (ké-iks) and is his spirit or life.

The burlesque element, which the religions of Asia and Europe have banished almost entirely, appears here as an almost integral attribute of a god or genius. This appears to form an offset for the dire cruelties ascribed to the same demons, and is also characteristic of the religions studied east of Mississippi River.

The element of obscenity is only incidental to the burlesque element, but is sometimes very pronounced, especially in the beast stories. It was added to cause merriment only, and not for such immoral purposes as we see it applied to in the Decameron of Boccaccio and other products of a corrupt age.

801 The deified beings of a lower order, as animals, etc., appear sometimes as *one* person, but just as often in the mystic number of *five*, if not of *ten*. Fire, waters, springs, and plants are not deified, but lakes are sometimes. Clouds do not appear here deified as witches, as they do among the Eastern Indians.

Certain miracles are here achieved by bodily contact and symbolic acts; so dead animals are brought to life again by jumping three or five

THE KLAMATH INDIANS OF OREGON.

By Albert S. Gatschet.

INTRODUCTION TO THE TEXTS.

121 The most important and valuable monument of itself which a people can transmit to posterity is a national literature. But to answer the requirements fully, the literature of a people must possess a certain degree of completeness in portraying the national peculiarities. It should embrace not only sketches of contemporaneous history, of national habits, customs, and laws laid down in the native idiom, but we expect from it also a truthful rendering of the spiritual side of national life, of its physical and metaphysical speculations as we find them embodied in its myths, beliefs, superstitions and conjurers' practices, and of speeches and discourses of its representative men held on solemn occasions. The most fragrant flowers in any national literature are certainly the poetic productions, if a full account of their origin and purport is added to make them easily comprehensible.

While cultured nations are constantly engaged in perpetuating the memory of their thoughts and achievements by means of some alphabetic or syllabic system of writing, the uncivilized hunting or fishing tribes possess none, or only the most imperfect means of recording their affairs. All of them possess mythic tales, traditional history, and songs for various incidents of life; not a few are even originators of didactic folklore, of proverbs, and of versified rhythmic poetry. Many of these mental productions are remarkable for artistic beauty, others for a most interesting variety of detail; but all of them will, if collected with accuracy and sound

121 judgment, throw a profusion of light upon the physical and mental characteristics of the natives and on their past and present condition.

The task and care of fixing the unwritten mental productions of uncultured races and tribes thus devolves upon the white man. It is by no means an easy undertaking, and success can be attained only when the investigator is favored by circumstances. Ethnologic texts taken from an uncivilized people are of much intrinsic value only when the scientific collector is lucky enough to secure the services of intelligent and well-informed individuals whose veracity is above suspicion, and who have constantly resided among their own people.

Considerations of this nature guided me when I endeavored to commit to writing the strange mythology of Oregonian tribes, replete with the most fantastic stories of their elementary deities and tricksy animal daimons; and when the weird and unearthly strains of their war-whoops and dance-yells first struck my ear, I considered even these worthy of notation. I have not hesitated to assign the first and foremost place in this linguistic volume on the Klamath language to the "Texts" obtained from trustworthy Indians of the Klamath Lake and Modoc tribes, for I know that they faithfully portray the characteristic features and idiosyncrasies of these dusky denizens of a secluded upland region. These literary specimens are the foundation and basis upon which I have rested my investigations.

The language of these specimens, as the organ of transmission of the national ideas, had to be carefully sifted and overhauled before it could become the basis of linguistic and ethnologic investigation. Numerous revisals and comparisons were needed to eliminate involuntary mistakes of Indian informants, who never elevate themselves above a purely empiric mastery of their native idiom. That an accurate grammar can be composed upon the solid foundation of faultless texts only, nobody will contest. Neither will it be doubted that the more copious the specimens are the safer the conclusions of the linguist will be concerning the principles governing the forms of speech.

Literary productions enlarging upon national and ethnologic matters are of much greater importance for the scientific study of the language in which they may be composed than any other texts. How poor and frag-

121 mentary would our knowledge of Latin and Greek be, if the poets, orators, and historians who wrote their compositions in these sonorous idioms were lost, and if nothing in them had come down to our age but versions of foreign books and reproductions of foreign speculations and ideas! A writer or informant is most capable of acquainting us with matters concerning his *own* people, country, and epoch, because he feels more interested in these topics than in any others, and he will select from the national stock of words the proper term for each object or idea he desires to express. Investigators will therefore, when they address themselves to intelligent natives for national, tangible and concrete topics of every-day life, generally obtain correct and trustworthy information on their objects of research, but will meet with disappointment when inquiring for equivalents of terms or ideas totally foreign to the simple understanding of the native population.

An experience of short duration will convince any linguistic investigator that a multitude of characteristic, quaint, and unfrequent expressions, idioms, phrases, and inflectional forms can never be obtained by mere questioning. The natives must be allowed to speak out their own free minds, without bias or trammelling; after a short acquaintance they can easily be induced to recount popular stories, myths, incidents of history, or intertribal wars, to reproduce speeches and national songs from their own reminiscences, and thus they will spontaneously use peculiar forms of language which often yield a deeper insight into the genius of their vernacular idiom than pages of information gathered after the usual method of the scholarly lexicographer or the pedantic verbal translator.

Legends, myths, and lyric productions, when obtained in their original shape from unsophisticated relators, furnish us with the best material for inquiries into a far remote antiquity, even when the historic horizon of the informant's tribe does not exceed the limit of two generations. If facts and dates do not, words and radical syllables will tell us a tale, and may enable us to trace ancient migrations or intertribal connections, teach us the origin of certain customs, habits, or national ideas, and inform us of the shaping, the material, or uses of old implements. In some instances they will guide us into remoter periods than prehistoric archæology can, and supply us with

121 more useful dates and facts. Such results as these may be confidently looked for when several dialects of one linguistic family can be compared; and a careful comparison of one language with others spoken in the vicinity, belonging to the same or a different family, will always be attended with beneficial results for the increase of our scientific knowledge.

124
127 The aboriginal literary monuments printed below are authentic national records of a brave and industrious mountain tribe of Indians. Ethnologic notices have at a comparatively early period been gathered concerning the Modocs and Klamath Lake Indians, but most of them were of doubtful scientific value, because the information was gathered from them in the English language, which they understood but very imperfectly. Even now, the dates and facts recounted by them, as well as by Indians of many other tribes, in English, are so extremely confused, that only texts written in their own language can give us a clear insight into their traditions, myths, and mode of thinking.

538 No Indian tribe possesses a history of itself reaching back further than two or three generations, unless it has been recorded by whites at an early date, and what goes beyond this limit is tradition, on which we must be careful not to place any implicit reliance. But mythology records in a certain sense the intellectual history as well as the metaphysical ideas of a people, and thus by the gathering of the numerous mythic tales and legends of the Mák̲laks a start at least is made for the investigation of their intellectual development. A very moderate estimate puts at several hundred the more generally circulated myths of the Klamath Lake or É-ukshikni alone, and the number of their popular song-lines, so interesting and unique in many respects, may be called infinite, for their number is increased every day by new ones. The bulk of their mythic folklore is of great poetic beauty, freshness, and originality, and, like that of other tribes, full of childlike "naïveté." This latter characteristic forms one of their greatest attractions, and the animal myths of every uncultured people will prove attractive, because they were invented for religious or poetic and not for [173] didactic purposes. To some of the myths given below we may confidently ascribe an antiquity of over three centuries, for their archaic terms

Introduction

[P. XV]

DURING THE LAST HALF OF THE NINETEENTH CENTURY THE RESERVA- 121 •
tion came to be regarded by Indian policy makers as an instru- 657 *
ment for directed culture change, depending for its success upon 648 *
effective control over the governed and the selective modification of their culture toward that of the dominant society. The following pages detail the manner in which that policy figured in the transformation of several Indian societies in south-central Oregon, who came collectively to be known as the Klamath Tribe.

If we are to see the reservation in perspective, we must know its local antecedents. It is essential to know something of the aboriginal past from which the Indian signatories had sprung and of the modification in their lives wrought by the period of contact prior to their treaty agreement to enter upon reservation life. To isolate the contractual parties, Indian and white, from the events of settlement, tribal dislocation, and cultural confrontation that made the reservation a desirable solution for both would deprive the decision of its historical import. In the same way, it would be misleading to examine the reservation as if it existed in the isolation that was part of its ideal character. When (175)
Treaty Commissioner Huntington wrote in 1867,

> The design of the Government is to segregate the Indians upon lands set apart for them, separate them from the pernicious influences which association with whites entail upon them, and to cultivate the good, moral, and intellectual qualities they may possess.

he was outlining a situation that proved difficult to maintain.

It is within the frame provided by this policy that the history 121
of the Klamath Tribe falls most readily into segments. The first 175
period ranges from the aboriginal threshold to the treaty of 1864 657*
648*

• 121 and the formation of the reservation. For the next twenty years,
175 until the General Allotment Act of 1887, the control of the
*657 Agency proved most effective, perhaps in part because the most
*648 violent eruption, the Modoc War of 1872-73, polarized loyalties
and removed dissidents. From the time of allotment in severalty, control over the course of change began to abate the effectiveness of Agency supervision; and with the opening of the reservation to massive commercial lumbering in the second decade of the twentieth century it declined rapidly. In the final years, until the termination of the reservation by law in 1954, the Agency did little more than preside over a population which, in essential respects, had passed beyond its power to control.

By that account, Agency rule was on the wane for some seventy of the ninety years which the reservation lasted, and was disputed by a war during the first decade. However, effective supervision was maintained longer in some areas than in others; and some powers, rather than lapsing, were passed on to local state, county, or municipal agencies. As a result, the picture is not to be summed up along a single dimension, but like history everywhere, must be seen in detail.

KLAMATH CHILDHOOD AND EDUCATION[1]

By

MARION PEARSALL

INTRODUCTION

121 The communication of knowledge from one generation to another is a subtle process in any culture, and especially so among primitive groups with no clearly defined and well formulated educational system. Any study of primitive education is, therefore, difficult to demarcate. In its broadest sense, education might be defined as the formation of manners and habits by means of instruction, by both physical and moral discipline. The acquisition of all attitudes, knowledge, and skills can be included in education. A thorough investigation would have to answer the question of where, when, and how the individual acquires each item of his adult personality.

Obviously, no complete picture of education in any primitive group can be drawn after a single season in the field. The present study makes no pretense of being definitive. It is our intent to show the gradual development of the Klamath child from infancy to adulthood as he receives physical, religious, and moral training, as well as instruction in the food gathering techniques and skilled crafts of his culture. Undoubtedly many phases of the culture have been slighted, but we have tried to show in a general way the type of instruction and encouragement given the maturing child. Klamath 114 ethnography has been well known for years through the works of Gatschet (1890), Coville (1898, 1904), Dorsey (1901), Barrett (1910), Spier (1930), Voegelin (1942), and others. For 128 that reason, the details of language, material

[1] The present study is based on data collected for the University of California during a two-month stay on the Klamath Indian reservation in southern Oregon in the summer of 1947. Much of the material presented in this paper was gathered by Mrs. Betty T. Dasey, and the research represents our joint efforts. [122]

PREFACE

101
114 The following comparative ethnographic study of fifteen northeastern
California groups and one group in southern Oregon is based on approxi-
121 mately three and one-half months' field work (July-October, 1936), under-
taken while serving as Research Assistant in the Department of Anthro-
pology at the University of California. During the six months' period
which the appointment covered I incurred numerous obligations for as-
sistance.

000 To Dr. A. L. Kroeber, director of the culture-element survey, I am indebted for much sound advice, never-failing coöperation, and many courtesies extended throughout the term of appointment. To Professor E. W. Gifford, Dr. Robert H. Lowie, and Dr. Harold E. Driver I am likewise under obligations for their coöperation and numerous courtesies.

I also wish to thank those authors who have written the detailed and pioneer monographs on many of the groups covered in this study; these include Drs. Leslie Spier, A. L. Kroeber, Ralph L. Beals, Isabel T. Kelly, Cora Du Bois, Edwin M. Loeb, and Mr. E. W. Gifford. Many of these authorities, and also the late Professor Edward Sapir, of Yale, supplied the names of reliable informants for the groups I was to study, and otherwise oriented me concerning field conditions. To all these scholars I am greatly indebted, both for their personal coöperation and for their valuable publications on various tribes in or near the area surveyed. Since I worked with both the Shasta and the Maidu, it is almost needless to mention how often I leaned on the late Dr. Roland B. Dixon's ethnographic studies of these two tribes, and how delighted I was to obtain western Shasta data from Sargent Sambo whok some thirty years before, had been Dr. Dixon's chief informant.

114 The difficulties of living on an extremely mobile field trip were lightened by virtue of having with me three interested companions. My husband, Dr. C. F. Voegelin, and our daughter, Gail, spent July and August in the field. To Dr. Voegelin I am deeply grateful for frequent linguistic aid and for encouragement in the pursuit of a new ethnographic field technique. To Gail, and likewise to my father, Mr. Roscoe Wheeler, who proved an ever-cheerful companion during the latter half of the trip, I wish to express a happy appreciation of their comradeship and their responsiveness to informants and informants' families.

115 Many kindnesses were extended to me during field work. Mrs. John Perry and her late husband, of Greenville, offered the hospitality of their home and were helpful in suggesting suitable informants. Mr. and Mrs. C. H. Barton, of Horse Creek, temporarily released Sargent Sambo from their employ so that I might work with him. Mrs. Lucy Thomson, my informant for the Southern Nisenan, had my father and me as guests in her home during our stay at Stanfield Hill. Mrs. Winnie Shiffbauer, Modoc; Ben Bridge, Achomawi informant, and his wife; and Mrs. Amanda Wilson, Valley Maidu informant, were likewise generous in hospitality. The interest and cooperative spirit I met with among these and many others of my informants puts me under a debt which cannot easily be acknowledged, but which will always be a pleasure to recall.

122 Assistance in the preparation of field material for publication was furnished by the personnel of Works Projects Administration Official Project No. 665-08-3-30, Unit A-15.

Preface

[P. vii]

THIS BOOK IS THE PRODUCT OF MANY MINDS. IN 1949, SHORTLY AFTER 114
coming to the University of Oregon from fieldwork with the Chickahominy and other "remnants" of the Virginia Tidewater, I was introduced to the Klamath by Dr. Luther S. Cressman, who was then in the midst of archeological research upon the reservation. That summer, with three graduate students. Eleanor Ribbans, Patricia Marks, and Hiroto Zakoji, I began a study of Chiloquin, a reservation town. The next summer, I resumed work, joined by Miss Ribbans, Mr. Zakoji, and by Barbara Davidson, Virginia Hastings, Michal Lowenfels (Cane), Thomas and Ann Dutelle, and Leonard Turner. In 1951, we turned to matters of folklore, linguistics, and ethnography: the force that summer comprised Mr. Zakoji and Richard Pope. Subsequently, I was retained by the tribal attorneys as an expert witness in issues before the Indian Claims Commission, in which capacity I became the student of my colleagues, Drs. Verne F. Ray and Omer C. Stewart.

After an interim spent in launching a comparison study on the Umatilla reservation and a year in Burma, I returned in 1956 to resume linguistic work. The following year, Dr. Vincent Os- 114
trom and I initiated a study of the termination of federal super- 122
vision over the Klamath reservation, under a grant from the Commission on the Rights, Liberties, and Responsibilities of the American Indian. We were assisted by Mr. Jack Pierce and Dr. Bert E. Swanson, as well as by Mrs. Marilyn Gerber Livingstone. In the field, we received many courtesies and much enlightenment from Mr. Zakoji, then Director of the Klamath Information and Education Program, under the Oregon Department of Education, operating by contract under the Termination Act. Dr. James A. Clifton soon began to do psychological re-

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

114 122 search under a separate grant, and provided facilities for other students, Miss Deanne Rasmussen, who studied child-rearing practices, and Dr. and Mrs. Brian A. DuToit, who made a brief survey of the small community of Beatty, to amplify our observations in Chiloquin.

000 In addition to all of these, others who were carrying on studies at the same time provided many insights. Here may be mentioned Dr. and Mrs. Robert F. Spencer, Dr. William N. Fenton, and Dr. M. A. R. Barker. Similarly, my colleagues in the department of anthropology have been an unfailing source 128 of stimulation. Among them, Drs. Luther Cressman, H. G. Barnett, and Vernon Dorjahn have made the greatest contribution. Drs. Cressman, Dorjahn, and Martin Schmitt, during my temporary absence from the country, undertook to oversee the drawing of several of the maps and the assembly of photographs.

127 Archival materials have come from several sources. I am indebted to officials of the Bancroft Library, University of California, Berkeley, for certain manuscripts in the Bancroft Collections; to the Robert H. Lowie Museum, of that University, for use of materials from the collection of C. Hart Merriam; to Dr. Thomas Vaughan and the Oregon Historical Society for use of the typescript copy of Joel Palmer's pocket diary; and to Martin Schmitt, Elizabeth Findley, and the Library of the University of Oregon for use of the Lindsay and O. C. Applegate Papers, and for many kindnesses.

The General Services Administration Records Center in Seattle provided archival materials from Klamath Agency reports, while the Portland Area Office of the Bureau of Indian Affairs, under Don C. Foster and Martin B. Holm, placed at our disposal many official files. Likewise, officials of the Klamath General Council and the Tribal Executive Committee gave us every courtesy and 000 made available back files of tribal minutes. Finally, it would be remiss not to acknowledge the assistance given the study by the Klamath Management Specialists, the city officials of Chiloquin, and officers of Klamath County agencies.

128 Above all, the Klamath people and the residents of Chiloquin have provided us with the individual perspectives which here I have sought to place within a larger frame. Several have kindly read the resultant manuscript on Chiloquin and have suggested

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

revisions of no small merit. They include the late William C. Lorenz and his wife, Claudia, Mr. and Mrs. LeRoy Gienger, Seldon Kirk and his daughter, Lelia, and Mr. and Mrs. Joe Ortis. 128

A quiet, though indispensible role has been played by my wife, and a number of her insights have found their way, unacknowledged, into these pages. 000

The Klamath research, through the years, has received support now gratefully acknowledged, from the Social Science Research Council, the American Council of Learned Societies, the Fund for the Republic, and the Faculty Research Program of the University of Oregon. Two chapters of this volume have previously been published: Chapter Two appeared as "The Klamath Indians and the treaty of 1864," *Oregon Historical Quarterly,* 57 (1956 : 229-73; and Chapter Seventeen as "Livelihood and tribal government on the Klamath Indian reservation," *Human Organization,* 20 (1961-62): 172-80. They are reprinted here by permission. 122 • 128

M
122 ●

The following information concerning the Lutuami or Klamath Lake and Modoc Indians of northeastern California and southern Oregon was obtained during the summer of 1907 as a part of the work of the Ethnological and Archaeological Survey of California, maintained by the University of California through the generosity of Mrs. Phoebe A. Hearst. These Indians now live almost entirely on Klamath Indian reservation in Oregon,

114 for the field researcher and analyst were one and the same person. It then (120) seemed potentially fruitful and appropriate to organize a collaborative effort with an experienced psychologist, and it was at this juncture that David Levine began participating in the research. The result of that effort is this report, with its markedly inductive and qualitative approach.

121 Aside from an assessment of the attributes of Klamath personalities, we are, thus, concerned with several somewhat broader questions. Because of the former, the Psychologist has set one task as the idiographic analysis of each subject's Rorschach record, but because of the latter concern this analysis must be considered doubly idiographic. We are at one and the same time concerned with two kinds of wholes, each Klamath person, and the total socio-cultural setting. On the one hand, the Anthropologist's interest lies in the relations between personality factors and the configurations of Klamath Reservation Culture, and, thus, in Redfield's terms, in contributing to an understanding of the reservation (125) as a "unique analysed system" (Redfield 1955). On the other hand, the Psychologist became interested in this setting because of his concern with using the Rorschach as one measure of Ego-development, or the level of psychological maturity. In this respect, and aside from the intrinsic interest of each, the ten case studies are seen as a possible means of bringing to bear certain portions of psychoanalytic theory and Werner's genetic psychology theory upon the task of explaining some aspects of the styles of behavior prevalent in the peculiarly stifling environments of American Indian reservations. We are, therefore, interested in developing useful approaches to larger problems and in building hypotheses.

12 With respect to the division of labor, Clifton collected the original data and was responsible for writing Sections I and II and the introductions to the case studies, while Levine gave his attention to the analysis of each case. The concluding section is a joint effort. Levine's analysis of the Rorschach records has been without extensive foreknowledge of the characteristics of life on or the history of the Klamath reservation, and without foreknowledge of the particular experiences or cultural status of the subjects. The collaboration of Anthropologist and Psychologist, the inductive, case-study approach, and this "blind" analysis thus put this report in the culture and personality tradition most recently represented by Gladwin and Sarason's Truk study. Indeed, this report was partly prompted by Gladwin and Sarason's recent complaint that "...studies which would refine and carry forward this or other systematic methods 121 of case analysis have not been forthcoming." (1959: 175). While we agree that analyses of comparative data should be made available, in all modesty we cannot lay claim to a refinement of the case study method. Again, we are concerned with developing useful theoretical ideas, or in finding a place to transplant an existing idea, rather than with methodology.

122 We are indebted to Zygmunt Piotrowski for his approach to Rorschach analysis and for suggesting the possibility of our collaborating, to Luther Cressman of the University of Oregon for providing facilities for publication and for initial support of the field work, and to Theodore Stern, also from the University of Oregon, for continuing assistance and encouragement in and out of the field. (121) Section II of this report draws heavily upon Dr. Stern's published and unpublished Klamath materials, for which we are particularly grateful. During 1958, James Clifton's field work was supported by a Social Science Research Council Fellowship for Training in Social Anthropology, while support for the 1959 research was provided by the National Institute of Mental Health in the form of a pre-doctoral fellowship and research grant. The National Institute of Mental Health has, additionally, financed publication costs of this report.

NATIVE MYTH AND MODERN RELIGION AMONG THE KLAMATH INDIANS

By Robert F. Spencer

773 IN A RECENT STUDY[1] of social change among the Klamath Indians
177 of southern Oregon, informants revealed an unformalized synthesis of
178 aboriginal and modern Christian religious beliefs. These involve, among
[776] other ideas, an identification of the Klamath culture hero with personages in the Christian pantheon such as the God-Father, Jesus, and Satan. This is of interest since the contemporary Klamath have lost all formalized aspects of their older culture. The major institutions of the past have fallen by the way and, in their overt forms at least, have been replaced by those of the encroaching Anglo-American society. Acculturation is so far along that the observer
[182] can elicit only covert survivals of aboriginal ideas. Although the tone of the folk culture has been lost by the Klamath, the reservation life, a common economy, and the wardship status enforced by external governmental agencies combine to effect a haphazard solidarity in the group. It is hence not surprising to discover a rephrasing of older values to meet modern situations. A case in point is the attempt by many tribal members, young and old, to find continuity in folklore and so to read Christian meaning into aboriginal myth.

175 Klamath culture of the past was not essentially different in its orientation
177 from that of many western tribes. Because the tribe was geographically marginal to several culture areas, it is possible to note the composite nature of its culture and to discern the realignment and reintegration of elements which
[222] it shared with California, the Plateau-Basin, and the Northwest Coast. In
[226] its overall configuration, the native culture differed from that of the adjacent gathering peoples because the Klamath had settled on the lakes and marshes
[631] of the region and depended on fish and a wild water-lily. Beyond the basic
[621] economic structure, however, one may note the California flavor of the separa-
[771] tistic hamlets with their loose social and political organization; the weakly
[791] developed (and possibly late) wealth complex, suggestive of the Northwest and the Oregon coast; and the formalized shamanistic religion which points to affinities with tribes in the Plateau, California, and elsewhere.[2]

---

[101]
[122] [1] This paper is based on data collected during two summer field sessions, 1948 and 1949, on the Klamath Reservation. Field research was subsidized by grants no. 21 (Reserve Fund, 1947) and no. 1132 (1949) from the American Philosophical Society, Philadelphia, and by research funds from the Department of Anthropology, University of Minnesota, Minneapolis.

INTRODUCTION

114 The texts presented here were collected during the summers of 1955,
1956, and 1957 which were spent among the Klamath Indians at Chiloquin,
122 Oregon. The field work was carried out under the auspices of the Survey
of California Indian Languages, Department of Linguistics, University of
115 California, Berkeley. The narrators of the myth texts were Mr. Robert
David, Mrs. Pansy Ohles, and Mr. Grover Pompey; the ethnographic materials
were obtained from the first two of these and from Mrs. Aggie
Butler, Mrs. Grover Pompey, and Miss Irene Skellock.

126 Most of these texts were recorded directly on tape, but some were taken down first in dictated form and were taped later. Of the myths, only Texts 1 and 7 were not recorded on tape. Of the ethnographic materials, Texts 24, 25, 29, 30, 31, and 35 were dictated only.

[124] No really exhaustive attempt was made to obtain a complete collection of Klamath myth texts. Instead, the author aimed at a representative collection of materials, including myths told by several informants, autobiographical experiences, ethnographic texts, historical incidents, conversation, and also the responses to a series of elicitation pictures (Text 39). It was felt that these texts would provide, on the one hand, good illustrative material for further linguistic studies in Klamath, and, on the other hand, a representative sampling of myths and ethnographic material of interest to the folklorist and ethnologist.

114 The collections of Klamath myths so far published are limited to A. S. Gatschet's "The Klamath Indians of Southwestern Oregon (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890) and some brief song and medicine texts in Leslie Spier's "Klamath Ethnography" (University of California Publications in American Archaeology and Ethnology, vol. 30, 1930). More recently, Dr. Theodore Stern of the University of Oregon has collected a large number of Klamath myths. The author understands that Dr. Spier also possesses a collection of myths. It is urgently hoped that both of these will be published in the near future.

128 The present collection is divided into two major parts: Myths, and
773 Ethnographic Texts. The former contains tales about the inhabitants of

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it be-
[154] came apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to
characterize the confused orientations, the value conflicts, and the disorganized
family life of persons early in their life arc, but the same persons frequently
settled down to a respectable, stable "Elite Acculturated" mode of existence
in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was
considered, but it was apparent that the major cause for refusal was the ab-
sence of an existing friendship relation between subjects and field-worker
(or some influential intermediary). Moreover, an analysis of the status of those
who refused indicated that this reaction was neither confined to nor clustered
within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a delib-
erately representative sample of the reservation population. The criteria of
representativeness included variations in social roles assumed by the subjects
(occupation, sex, leadership, and so on), variations in role performance, differ-
[123] ences in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently,
approached through the recommendations and aid of an intermediary, or, finally,
a direct effort was made to become acquainted with a suitable subject. In all
instances, an existing friend relationship proved the more successful mode of
approach. For reasons to be suggested in the next section, there are few Klamath
persons whose influence is both high and extensive, and, conversely, few who
[123] can easily accept external imposition of controls. Thus intermediaries, what-
ever their manifest status, rarely could elicit the cooperation of more than one
suitable subject. The result of this effort was a set of Rorschach and Thematic
Apperception Test Records, and short life-histories on a sample of fifty four
persons, which sample could for the purposes of the research be considered as
[128] reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety
as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there
is another aspect of the field method used in the Klamath study which may be of
[123] some interest. In each instance the potential subject was made aware of the in-
tentions of the field worker and the purposes of testing and interviewing. It
[181] will be clear from the next section that the contemporary Klamath are in no rele-
vant sense "primitive," nor are they an isolated population. Indeed. many sub-
125 jects were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the
clouds" or figures in rock formations. Further, most Klamath under fifty years
of age are sufficiently experienced in the practices of American culture to
have some personal familiarity with the "test situation," whether personality,
aptitude, vocational, or intelligence. Thus there was a shared basis for this
peculiar form of interaction.

Because it is for several reasons considered important, the fact that each 125
Klamath subject was, in general terms, made aware of the intentions of the 123
examiner and the logic of the test procedure should be emphasized. Recently,
Hauck has described a different approach used for research among the Unitah- 125
Ouray Ute, where he modified the usual Rorschach procedure by concealing the 114
purposes of the test beneath a supposedly innocuous "cover story" (Hauck 1955: 10).

This approach to field testing is subject to criticism on several grounds. In 125
the first place, it is somewhat less than ethical to conceal the purposes of a 123
test so as to facilitate cooperation, and then to publish results in line with
original intentions. Occasionally, this approach has been used in culture and [114]
personality research. It entails the assumption of a kind of mechanical meaningfulness of any responses to projective tests, however administered, and whatever
the test taking attitude of the subject. At a minimum, the subject has the right
of knowing what he is involved in and the privilege of refusing. Secondly,
where clinical methods of interpretation are to be employed, it is essential
that field research using projective tests as closely as possible approximate
the clinical situation. This assumes that the cooperating research subject is
more apt to reveal important aspects of himself if he clearly understands the
intentions of the examiner. Indeed, one purpose of projective testing is to 12
facilitate communication about difficult topics, not to unduly impede it with
artificial barriers.

Another aspect of this issue is that most American Indian populations include 12
some members with higher education, or, like the Klamath, others with some 177
awareness of the "ink-blot" or the "picture" test via spectatorship in the mass [171]
media. Because of this awareness, any subterfuge or concealment of test objectives may be publically revealed and further distorted. The consequence of this
can only be a confused or negative appraisal of field research and field researchers. Given the existing wariness and suspicion of many American Indian
populations and their concern with their status as "Guinea Pigs," such an outcome is not very desirable. Finally, it is quite conceivable that another field
worker might want to pursue similar research in a situation where the purposes
of a test have been concealed. If so, he will have to support the original lie,
either by accepting it or by expanding upon it.

Quite frequently, the success of field research in the area of culture and 12
personality studies turns upon obtaining an adequate sampling of a population
in a very limited period of time. Perhaps, as is suggested by the extensive
sampling of Hallowell and the Spindlers in repeated field sessions, it is the time
factor which is crucial. In terms of the ethics of research, the validity of
results, the richness of materials collected, the possible consequences of
distorting objectives so as to obtain cooperation, and the implications for
future field work, the alternative approach of using a "cover story" to obtain
quick results is not desirable.

The Klamath personality research grew out of Clifton's participation in a larger 114
study of Klamath reservation culture. The initial, unpublished, evaluation
of the test and life history data was intended to improve understanding of the
psychological consequences of acculturation in the Klamath case and to give
additional depth to other studies of styles of Klamath behavior. This first
approximation, although suggestive, did not prove entirely satisfactory, largely
because of too mechanical a utilization of what are, in the trade, called
"standard interpretative hypotheses." In short, the initial report was too
cookbookish. At the same time the possibility of bias had to be considered,

Susan: Female, Age 24

Background Data

156 Unlike Slim, Susan is not so well liked or respected. The occasion for this is
759 specific, an unsanctioned pregnancy during her last year in high school and a
[848] more recent marriage to an entirely disreputable Mexican from Utah. This community
evaluation is accentuated because of the very high respect in which her
[582] own family is held. Everyone expected better of Susan.

[626] Susan has worked as a dishwasher in several cafeterias, both on and off the
reservation, and moved to Utah so as to take a practical nursing course. She
*759 found this training uncongenial, met and married her husband, and they returned
[464] to the reservation when his small business failed. Susan is a high school graduate.

[874] Susan's mode of selecting a husband parallels that of her mother, who met her
husband while hospitalized in New Mexico. Her father by birth is an Apache
*759 Indian, and by cultural affiliation a southwestern United States Spanish-American.
593 Without doubt, he is the most autocratic, stern, demanding, rigid adult male on
the reservation. Although a married woman with children of her own, Susan must
ask her father's permission to use the telephone or to walk downtown. Her mother
was Klamath and very well respected for her stable family life and for her active
participation in many community activities. Susan was extremely close to her
mother until her unexpected death several years ago. They were known as an inseparable
pair and her mother never went out of the house without her. The
mother's death was, perhaps, the major cause of Susan's failure to complete her
nurse's training. Susan's illegitimate pregnancy in high school was a considerable
shock to her mother and is, with her marriage, a continuing source of strain
[155] with her father. Susan evidently feels that her behavior was a contributing
cause for her mother's death. She made a death-bed promise to her mother that
she would not be a loose girl and that she would marry and stay married to one
man. It was shortly thereafter that she married and returned to the reservation
to live with her father. There is much strain within this household, derived
from the relations between father and son-in-law, and from Susan's unsuccessful
efforts to serve two masters, for along with her marital relationship she evidently
[626] was trying to act as a replacement for her deceased mother's role. At the
same time her conduct has alienated her from the church, from family friends,
and from the community.

*759 The contact with Susan was made via her father, who told her that she should
cooperate. Her father's motivation in this was not, as may be supposed, the conviction
[124] that she needed testing because something was wrong with her, but involved
•[123] a more general sentiment. He felt somewhat honored to have an "educated
man" visit his house and that such a contact was a good experience for his children.
[593] Susan accepted this like an obedient, dutiful daughter. She came readily,
with no indication of unwillingness, and relations with her were quite good,
perhaps because of the strains of her marginal position and her need to talk
with someone.

*759 Susan seemed an apathetic person whose feelings were dulled. If anything, her
157 reactions were those of an over-trained, too obedient child. She was not very
responsive or active, and would seldom talk except to answer a direct question.
Then she would, frequently with evident pain and anxiety, describe her feelings
and situations tersely and haltingly. Susan clearly wants more than her life
now gives her, but cannot define her present conflicts or see her way clear to

*159 124 [150] *[123] Weasel was tested while in jail. He agreed to take the tests via an intermediary, and was anxious and tense throughout the session. But because of numerous experiences in correctional institutions he was quite suave concerning the test situation; he has had them in batteries, the MMPI, the Bender Gestalt, the Picture Frustration Test, some variant of the TAT, but never the "ink-blot" test. The jail situation provided no special stress, and the testing lead to the development of something of a friendship relation with the examiner.

() I see their head and their beak and their little wing. () Dunno, they're black and the shape of their head and beak. () The red spots. (Entire top half of card from "waist" up, including reds)

are marked by alternate periods of (brooding?) silence and she is more than a 159*
little pretentious, as for example her response to TAT card #1, "Oh, that's 157
that famous European violinist...Levi Strauss." Her life has been characterized [156]
by many extremely stressful situations, but she does not seem easily discouraged, [155]
and maintains her vigor and independence. She tends to over justify herself, as
if she had some doubt about certain of her characteristics, or as if she had
strong feelings of uncertainty or inadequacy. This is in strong contrast to her [156]
leadership role in her family, and her domination of many social situations. She
is also somewhat excitable and tends to directly express her emotions more than
many other Klamath.

The working relationship with Grandma was one of the best. When she first 159*
learned the writer was an Anthropologist she warmed to him immediately and 124
volunteered to take the tests. She was tested "on the job," at the top of a [123]•
200 foot fire lookout tower in the midst of the Klamath forest.

Lily: Female, Age 15

Background Data 159*

Lily is an attractive young high school freshman. She is now repeating her 156
freshman year, due to various difficulties the year before. One of these in- [873]
volved her cursing the principal, for which she was temporarily expelled, to
be returned by her mother the next day. She spent the rest of the year in
silent rebellion. This incident is not too serious, for more than anything [561]
else it indicates the strength of her attachment to a close-knit girls peer-
group which is slightly wild and which makes it a matter of honor to oppose
adults. There is little additional evidence of any serious hostility or re-
belliousness. Lily is the eldest of two children; she has an elder half-sister,
her mother's illegitimate daughter; and she has lived all of her life on the
reservation.

Lily's major activities and concerns are those of a typical, small town teen- [883]
age girl. She attends school, "hangs around" a local teen age center, flirts
with the boys — White and Indian, dances — at her home or the home of a friend,
and listens to records. She comes from one of the most stable families on the
reservation. Her mother is Klamath, a grade school graduate who worked her way [874]
through two years of business school, evenings, in a nearby city. Her mother in
recent years has begun to assume a position of leadership in certain community [571]
activities, particularly recreation and education. Additionally, she has for
long been the advisor for numerous relatives. Her mother verbalizes great fear
and anxiety associated with this "getting out" and has done so only under con-
siderable external pressure. Her father is a California Indian who is the model [177]
of local White conceptions of masculinity. That is, he is vigorous and physi-
cally powerful, a hard, reliable, steady worker in a logging company, a hard [464]
"Saturday Night" style drinker, absolutely fearless, and a masterful fighter
in brawls. His fights are the focus of several local folk anecdotes, and suggest [157]
his excellent reputation, for he protects the underdog, takes on the bully (by
the half-dozen, if necessary), neatly dispatches all and never bears a grudge.

Lily is a more flexible and less submissive person that she would seem on first 159*
acquaintance. The difficulty with knowing her is that she wears a completely 157
impassive, rigid, unexpressive mask before all. One morning after knowing her
for a year the writer walked by her and then stopped, mildly startled, for Lily
had smiled (slightly) and mumbled "Good Morning" under her breath. She is also [123]•
less inhibited than this mask of impassivity would suggest, as is evident from
her behavior with her peers and parents, but in all instances she prefers to
communicate with slight gestures and to make do with very few words. She is,
in fact, a remarkably self-possessed, poised, and reserved adolescent girl, a
consequence of which is that she is far more graceful than many other local girls
her own age. But, generally, her responses only minimally involve her with 159*
others. She is always among people, but not always with them. Her reserve does 156
not dissipate much with continued acquaintance, but is a constant feature of her
mode of adjusting to others. She never talks freely and her terse responses to
the blots and TAT cards are paralleled by an equal economy in all personal re-
lationships. There is no evidence to suggest that she is suspicious or distrust-
ful of others, although she can be quite persistent in avoiding people she does
not like.

CULTURE ELEMENT
NORTHEAST

B

ERMINIE W.

INTROD

121 The list of elements used in the field for this study was assembled from six other lists for adjoining areas which had been gathered by members of the culture-element survey and were still in manuscript form. Dr. Driver, Dr. Kroeber, and I collaborated in preparing the list which I was to use. It contained some 5500 elements. While working in the field I added and occasionally subtracted elements and often reorganized entire sections of the list; in the final preparation of the manuscript further reorganization was effected. I consistently attempted to keep complexes of elements together, in order to present a more intelligible picture of the patterns of the various cultures as wholes. This was not an easy task, since elements tended to be regrouped, in kaleidoscopic fashion, among the different peoples studied. To help solve this difficulty frequent use has been made of cross references in the ethnographic notes which accompany the lists.

● 124 125 With respect to field method, I found that working with an element list is a definite aid in making quick rapport with informants. Several of the sixteen informants interviewed repeatedly expressed both astonishment and respect when the questions I put to them from the list hit the cultural nail squarely on the head. Far from a list deterring informants from volunteering information, it obviously stimulated comments. All volunteered information, unless it came at too rapid a rate, was jotted down in a separate notebook which was kept open beside the element list itself.

I should like to emphasize here that while questioning informants I never used the element list in the rigidly mechanical "yes or no" fashion which some critics of element-list work take for granted as being a part of the field technique. The content of the ethnographic notes appended to the element list itself bears witness to the fact that informants were not only willing, but anxious to elaborate on the questions put to them. Some queries, such as whether the floor of a winter house is dug out or level with the ground, could be asked directly and a yes or no answer relied upon. But if the answer to this question was merely "Yes" the query "How deep?" always followed as a check. The answers to other questions, such as number of directions, month names, seasons, or whether the autonomous group consists of a single village, a group of closely adjacent villages, or a com-

[47-A]

DISTRIBUTIONS: XX
CALIFORNIA

r

. VOEGELIN

UCTION

124 munity of clusters of settlements, obviously
could not be given directly. For questions such
125 as these, specific data were collected, as for
example, native names for directions, months,
seasons, data on village groups and the headmen
or chiefs of such. The same is true for questions
relating to exogamy, marriage, and other social
customs.

As one worked, intensively and rapidly, with a detailed orderly list of questions on which to rely, needless repetitions with the same informant and dawdling over data approached the vanishing point. In no other way can I explain how within the space of four or five days as much information as is contained in an element list is collected. Previous to working on the survey, I
000 had made three successive summer field trips to the Tübatulabal, spending in all some eleven weeks studying Tübatulabal ethnography, and three much longer trips to the Shawnee to collect material for a Shawnee ethnography. My chief regret concerning both the Tübatulabal and Shawnee field work is that so much time was squandered because the only sort of lists I carried were of the hit-and-miss variety that one generally makes up preparatory to and during field work. The longer trips naturally afforded more opportunity for collecting mythological and ethnobotanical data, for example, than it was possible to gather while doing survey work.

After completing this survey I had the opportunity to use part of my California element list for questioning one of my most reliable Shawnee informants. Although the list I used was not assembled for an eastern group, I was agreeably surprised on two points: (1) that the informant stuck to the point of the questions and often volunteered pertinent additional information, and (2) that by trying out the list I uncovered the presence, among the Shawnee, of a game concerning which I had never before been able to secure information, and also obtained data on several items of material culture that heretofore had been missing from my record. Among some eastern tribes, such as the Central Algonquians, for example, one difficulty might arise which was not of paramount importance in California; it might be hard, working on short notice, to secure cooperative and at the same time reliable informants. This difficulty could however be partly obviated, I believe, by using a technique which always worked well in California, namely, inquiring in advance from the informant with whom one

KLAMATH CHILDHOOD AND EDUCATION [1]

By

MARION PEARSALL

INTRODUCTION

128 culture, social and political organization are
not described here except in their effect on
124 education. Wherever particular items are mentioned, we specifically asked our informants for
a description, even though they had been described in previous ethnographies. Such accounts may thus be taken as corroborating
earlier evidence unless otherwise specified in
the text.

131 The Klamath reside in their old territory
178 in southern Oregon, but the aboriginal way of
life has long since disappeared. Today they are
241 farmers and ranchers, but a considerable part of
the earlier culture remains alive in the memo-
233 ries of a few oldsters. Our seven informants
178 (4 men and 3 women) were all in their late
seventies or eighties and had participated in
the last phases of the aboriginal culture as
115 children. It is regrettable that it was necessary to reconstruct childhood training from the reminiscences of elderly individuals. Doubtless much of the material represents the ideal rather than the actual pattern of education. The ideals do, however, give a definite insight into what was considered important in the upbringing of children, whether these standards were always maintained or not. Since there is little or nothing in the early literature on this subject, there is no way of comparing impressions received from old people who are admittedly looking back to "the good old days" with impressions of objective eyewitnesses to the old ways as they were really practiced.

BIRTH AND INFANCY

Barrenness is sometimes con-
sidered cause for divorce. Since the blame
842 seems to fall most commonly on the woman, her
husband's parents may suggest that he send her
586 away and get a wife who can provide him with
children. Ordinarily, though, the parents-in-
606 law are more lenient with a barren woman.
Most Klamath express a preference for boys. A
842 variety of reasons are offered, the most common
being that boys are less bother than girls.
"Girls are always getting into trouble, and you just raise them for someone else because they go off to their husbands when they get married." Once the child is born, however, there seems to be no special favoritism shown to boys. One

[p. 350A]

224
868
not all men are good hunters.[30] Hides are valuable, however, and a good hunter gains prestige. Part of the rigid physical training of the boys is directed toward preparing them for hunting. They are told, "Only smart ones who aren't lazy can be good hunters."

As previously mentioned, boys begin to learn the use of bow and arrow when very young. After learning to shoot at targets, groups of boys hunt birds and squirrels near camp. They kill these easily with their small bows and light arrows. Parents are very proud of boys who can get many animals. The boys also go

[text continues on top of p. 350-B]

CONCLUSION

124 Since the data presented here were collected from elderly individuals and not from direct observations on a living culture, one should perhaps be rather cautious in arriving at any conclusions about Klamath education. Most informants were bitter about the breakdown of culture which they have seen in the present generation of young Indians. They often reiterated their belief that children were much better reared in the old days. There are, however, certain generalizations which may be validly drawn.

861 There is really no formal education in the sense of organized, planned instruction of the young. Yet most families expect their children to conform to certain ideals, and the parents work for the achievement of these goals.

854 For the first two or three years of life, the child's every want is supplied by his mother. It is she who feeds him, attends to his needs, and watches him most closely, although the father or older siblings may tend the child for short periods. The infant receives little or no fondling, but he is often the center of attraction for the adults of his house group who pause and talk to him as they pass his cradle.

857
867
In about his third year, the child is thrust into active play with his age-mates. He learns that he is expected to be brave, strong, and fearless. He receives praise from parents and other relatives if he is fast and ambitious. If he is lazy or cowardly, he is teased and scolded. Girls as well as boys must learn to be active, energetic, and competitive.

Susan: Female, Age 24

Background Data

156 Unlike Slim, Susan is not so well liked or respected. The occasion for this is
*159 specific, an unsanctioned pregnancy during her last year in high school and a
[848] more recent marriage to an entirely disreputable Mexican from Utah. This community
evaluation is accentuated because of the very high respect in which her
[582] own family is held. Everyone expected better of Susan.

[626] Susan has worked as a dishwasher in several cafeterias, both on and off the
reservation, and moved to Utah so as to take a practical nursing course. She
*459 found this training uncongenial, met and married her husband, and they returned
[464] to the reservation when his small business failed. Susan is a high school graduate.

[874] Susan's mode of selecting a husband parallels that of her mother, who met her
husband while hospitalized in New Mexico. Her father by birth is an Apache
*159 Indian, and by cultural affiliation a southwestern United States Spanish-American.
593 Without doubt, he is the most autocratic, stern, demanding, rigid adult male on
the reservation. Although a married woman with children of her own, Susan must
ask her father's permission to use the telephone or to walk downtown. Her mother
was Klamath and very well respected for her stable family life and for her active
participation in many community activities. Susan was extremely close to her
mother until her unexpected death several years ago. They were known as an inseparable
pair and her mother never went out of the house without her. The
mother's death was, perhaps, the major cause of Susan's failure to complete her
nurse's training. Susan's illegitimate pregnancy in high school was a considerable
shock to her mother and is, with her marriage, a continuing source of strain
[155] with her father. Susan evidently feels that her behavior was a contributing
cause for her mother's death. She made a death-bed promise to her mother that
she would not be a loose girl and that she would marry and stay married to one
man. It was shortly thereafter that she married and returned to the reservation
to live with her father. There is much strain within this household, derived
from the relations between father and son-in-law, and from Susan's unsuccessful
efforts to serve two masters, for along with her marital relationship she evidently
[626] was trying to act as a replacement for her deceased mother's role. At the
same time her conduct has alienated her from the church, from family friends,
and from the community.

*159 The contact with Susan was made via her father, who told her that she should
cooperate. Her father's motivation in this was not, as may be supposed, the conviction
[124] that she needed testing because something was wrong with her, but involved
[123] a more general sentiment. He felt somewhat honored to have an "educated
man" visit his house and that such a contact was a good experience for his children.
[593] Susan accepted this like an obedient, dutiful daughter. She came readily,
with no indication of unwillingness, and relations with her were quite good,
perhaps because of the strains of her marginal position and her need to talk
with someone.

*159 Susan seemed an apathetic person whose feelings were dulled. If anything, her
reactions were those of an over-trained, too obedient child. She was not very
157 responsive or active, and would seldom talk except to answer a direct question.
Then she would, frequently with evident pain and anxiety, describe her feelings
and situations tersely and haltingly. Susan clearly wants more than her life
now gives her, but cannot define her present conflicts or see her way clear to

extensive plans for the future (e.g., opening a second-hand store and capitalizing on the poor buying habits of the "Indians.") none of which have much chance for materializing, but many displaying a fairly shrewd assessment of the local community. He can get quite enamoured with making these plans, and savors the profits in his current fantasy. 159* 154

Sparrow was tested while in jail, this being the only likely time when he would be sober enough to see the blots clearly. 159* 124●

Nell: Female, Age 33

Background Data

159*
In contrast to Sparrow, much of Nell's behavior is disparaged and negatively
sanctioned by the community, while she too must be located at the lower end of [156]
the status hierarchy. Nell got her first job when she was 18, and for the
last five years she has been working steadily as a clerk in the Agency. She [464]
is a high school graduate and has 2½ years of business school training. Except [874]
for being away at school and a short period of residence with one of her husbands in Oklahoma, she has lived all of her life on the reservation.

Nell was raised by her own parents on their ranch and is the second eldest of
nine children. Her earliest memories are of being fearful of domestic animals
and of preferring to be by herself, playing with her dolls. She seldom played
with her siblings or with other children, and her interest in dolls and making
and dressing paper dolls continued through her first marriage in her early
twenties. She felt that her mother always blamed her or the other girls for
everything, while her father favored his daughters. All of the children were [871]
sent away to boarding school, and most of their childhood was spent away from
home. By the age of 12, when home, Nell was busy with housework, cooking, baking, [857]
and caring for her younger siblings. In this large nuclear family there was an
extensive division of labor, with each assigned his or her specific tasks. Her [593]
parents never left their children with "sitters" or relatives. Their "caretaking"
activities are, perhaps, among the most consistent and extensive in the area,
with the exception of the boarding school. Nell received little direct instruc- [868]
tion from her mother, and her closest adult woman companion was her grandmother.
Nell knows none of the Klamath language. Both her mother and her father were [191]
disturbed because Nell always wanted to be off by herself. When she was in
boarding school her parents visited her once or twice yearly, but they never wrote
her. Nell preferred her father, and when she grew up she felt that her mother
was not the kind of person she had thought she was. Nell feels that this may be
due to her own behavior. She received no direct sex training, and was 18 before [864]
she discovered the significance of her menses. Her first sexual experience was
at 8, when she was molested by a cousin.

Nell has always preferred to play with boys rather than with girls. Today she [626]
is socially isolated at her office, where none of the other women speak to her. [156]
She is equally isolated from her family, who rejected her and threw her out of
their house when she was 20, at which time she was pregnant by her first husband,
who had deserted her when he discovered her pregnancy. She has been married and [586]
divorced three times and has maintained a regular liaison with at least five
other men. She will go directly from one such liaison to another, with never [156]
more than a few days between men, and on several occasions some overlap. Occa-
sionally one of her ex-husbands or ex-lovers returns to live with her and attempts [588]
to take up with her again. She has borne eight children, has had two miscarriages,
and at least one abortion. She cannot tolerate not having a man in the house
(it is her house maintained at her expense). Several of her children are tech-
nically illegitimate and the paternity of at least one is in doubt. It is this 59*
sexual laxity which particularly brings down the ire of the community upon her. 56

Nell thinks of herself as an unfriendly person who would rather be left alone,
particularly by other women. She always waits until someone else makes the first
advance. It was therefore surprising to have her show up one day and request [124]●
testing and advice. She was in trouble and she was convinced something was
wrong with her. The "presenting problem" was an unbearable load of shame, guilt,

*159
156 and anxiety associated with her responsibility in a double murder. She had
given a rifle as a present to a lover, and following a drinking party at her
house he had killed his brother and a stranger with it. Her thinking was extremely
morbid. She expresses the wish that the more violent of her previous
husbands would return and kill her.

*159 In the testing and interview sessions Nell's behavior quite definitely was not
representative of her ordinary interactions, and once she felt somewhat relieved
157 she immediately got more distant, withdrawn, and unapproachable. During testing
-[124] she exhibited a high level of manifest anxiety and an erratic pattern of interaction.
She was alternately over-talkative and quick to reply or to initiate
[152] a sequence, and then silent and down-cast. Her concern was real, for it was
known that she was under suspicion for complicity in the murder, but this was
not the root of her anxiety. What the connection was cannot be evaluated from
available evidence, but it may be that her conflicts were related to the trouble
her lover had gotten into, for it was his situation she wanted most to talk
[156] about. Normally she is relatively inflexible in her relationships and preserves
her withdrawn and isolated position at all costs. Her behavior then exhibits
a high level of drive, but is poorly organized, confused as to goals, and produces
repeated overt conflict with lovers, husbands, her parents, her children,
work associates, other community members, and law enforcement agents. Still,
she expresses the need to be cared for and dominated consciously, as well as the
156 feeling that she was being persecuted and rejected. She feels herself to be an
entirely worthless person, and this evaluation is shared by the community at large.

Rorschach Record

125 Note: With little variation between cards, each was approached by the S. in
*159 the following manner: She would take the card, repeatedly twist it and turn
it, swiftly cover portions of the blot with her hand or fingers, hold it at
arms length, hold it closer and examine it carefully, lay it down momentarily
and stare off "thinking," and then after a silent delay of an average 145" spit
out a series of responses rapidly, as if they were hot peas.

(1. W) (What suggested?) Might be this...reminds me of a cape blowing out. These points remind me of a sharp hat. (Cape blowing?) Just like when you see them on

Carrie: Male, Age 36

Background Data

156 Carrie is the model of a self-made, upwardly mobile, brash and back-slapping
*159 young American male. He is a tribal leader whose power is rooted in an amalgamation of various dissident elements, rather than in a large kin group, and a
[622] business man with numerous interests. He says, of himself, that "I have no occupation, as occupations go. I guess you might say I am a confidence man."

*159 Like the other subjects, Carrie was raised on a ranch by his parents. He is a high school graduate and a graduate of a junior college course in accounting.
[873] His work record suggests his ambition and his upward progression, for he started as a farm laborer, went to truck driving, then worked during World War II as
[464] a production machinist, completed his education, then worked for the Agency and, finally, was able to settle down to living off his several sources of income. He has never been out of the state except for short business trips. He spends most of his time on the reservation attending to tribal and his own business,
156 and participating in various voluntary and formal associations. More recently
*159 he has become active in politics on a local level and by some has been ear-marked as a "comer." His intellectual horizons are very wide, extending to a keen
[660] awareness of the difficulties faced by Dag Hammarskjold. His reputation is excellent and he is particularly esteemed by many Whites, although this esteem is
[626] not shared by all Klamath, which reflects only the factionalism of Klamath politics and, perhaps, the efforts of some to control a man who is too successful.

[184] Carrie has been married once and this marriage has lasted 15 years. He has six children and his family life, again, is precisely what might be expected of a successful young American. Carrie's entire style of life is entirely different from that of most other young Klamath men.

*159 Very little is known of Carrie's early life except that his background is rural Klamath and that his mother was a housewife and his father an indifferently and intermittantly employed laborer.

156 The writer never made much headway with understanding Carrie until the day he
*124 was brow-beaten into taking the Rorschach. Before this time he had been seen only as an aggressive, back-slapping, competitive, and somewhat empty character. He had agreed to testing, but had managed to slip out of several appointments until one day when the entire complement of field workers descended on him during a visit, arguing and insisting that he had to set the example. Carrie was thus hung on his own petard, and when we walked into the testing room there was some question as to who was the most fearful of the consequences of this episode, Carrie or the examiner. Carrie was manifestly tense and fearful, but in a very short period of time relaxed and accepted the test situation. Rapport was excellent, and Carrie clearly defined the situation as one where he should discuss
156 his private concerns, motives, and sentiments. From sessions like this it became evident that Carrie's brash front consisted of a set of behaviors he saw as appropriate to his position. That is, the social Carrie was a well defined role. Behind this persona lay a genuine concern with the welfare of tribal members and their future, as well as strong personal aspirations, deep committments to family and community, and fears associated with his private feeling that he was not an adequate or relaxed "mixer." He stated, for example, that "I guess I just don't have the courage to get out, even among my own people. I'm not much of a talker and I guess you'd say I'm kind of backward. I really prefer to be alone by myself." Some of this apprehensiveness is associated

*159 124 [157] [123] Weasel was tested while in jail. He agreed to take the tests via an intermediary, and was anxious and tense throughout the session. But because of numerous experiences in correctional institutions he was quite suave concerning the test situation; he has had them in batteries, the MMPI, the Bender Gestalt, the Picture Frustration Test, some variant of the TAT, but never the "ink-blot" test. The jail situation provided no special stress, and the testing lead to the development of something of a friendship relation with the examiner.

27" Doesn't look like anything, drawing a blank

(Add 9) Dr Fc'C a, blood Blackbirds with blood from their fighting.

(Add 9) (Anything now?) Is that the way I had it before? () Now it LL a cpl of black-birds. I dunno what this could be unless it was blood from their fighting. () I see their head and their beak and their little wing. () Dunno, they're black and the shape of their head and beak. () The red spots. (Entire top half of card from "waist" up, including reds)

are marked by alternate periods of (brooding?) silence and she is more than a 159*
little pretentious, as for example her response to TAT card #1, "Oh, that's 157
that famous European violinist...Levi Strauss." Her life has been characterized [156]
by many extremely stressful situations, but she does not seem easily discouraged,
and maintains her vigor and independence. She tends to over justify herself, as [155]
if she had some doubt about certain of her characteristics, or as if she had
strong feelings of uncertainty or inadequacy. This is in strong contrast to her [156]
leadership role in her family, and her domination of many social situations. She
is also somewhat excitable and tends to directly express her emotions more than
many other Klamath.

The working relationship with Grandma was one of the best. When she first 159*
learned the writer was an Anthropologist she warmed to him immediately and 124a
volunteered to take the tests. She was tested "on the job," at the top of a [123]
200 foot fire lookout tower in the midst of the Klamath forest.

128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another character-
istic of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
657 the functioning of west European, urban, middle-class persons. Considering the
realities of the Klamath situation, guarded restraint in itself may hardly be
[171] considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
In the instance of Slim, for example, we find that a superficially adequate ad-
158 justment may simply be the manifestation of an obsessive control over and reduc-
tion of emotional and intellectual processes to the point of a tentative diag-
[121] nosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are
examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

LETTER OF TRANSMITTAL.

SMITHSONIAN INSTITUTION,
BUREAU OF ETHNOLOGY,
Washington, D. C., June 25, 1890.

121 SIR: I have the honor to transmit to you my report upon the Klamath
Indians of Southwestern Oregon, the result of long and patient study. It
deals with their beliefs, legends, and traditions, their government and social
life, their racial and somatic peculiarities, and, more extensively, with their
126 language. To this the reader is introduced by numerous ethnographic
124 "Texts," suggested or dictated by the Indians themselves, and accompanied
by an interlinear translation and by "Notes," a method which I regard as
the most efficient means of becoming acquainted with any language. In
121 this report I have given prominence to the exposition of the language,
128 because I consider language to be the most important monument of the
American Indian. Archæology and ethnography are more apt to acquaint
us with *facts* concerning the aborigines, but language, when properly investigated, gives us the *ideas* that were moving the Indian's mind, not only
recently but long before the historic period.

Repeated and prolonged visits to the people of the northern as well as
of the southern chieftaincy have yielded sufficient material to enable me to
classify the language of both united tribes as belonging to a distinct family.
101 In their territorial seclusion from the nearer Indian tribes they show anthropologic differences considerable enough to justify us in regarding them as
a separate nationality.

197 There is probably no language spoken in North America possessed
of a nominal inflection more developed than the Klamath, although in
this particular, in the phonetic elements and in the syllabic reduplication
pervading all parts of speech, it shows many analogies with the Sahaptin

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

114 stage before the publication of the present volume. Even the author expe-
rienced considerable difficulties before he could pass beyond that limit.
[191] When he reached the reservation agency he found not over three or four
individuals who were able to speak a tolerable English, and the knowledge
of this tongue is absolutely necessary to any one who aspires to the posi-
tion of an interpreter of his own language in those parts. The Indians
were nearly all pure bloods, and most of them knew scarcely more than a
dozen English terms. Many could converse in Chinook jargon, but the
majority, especially the females, were not acquainted even with this preca-
rious means of intercourse. Indeed, these people must be slow in acquir-
ing an Aryan language like English, for it presents so many character-
[193] istics entirely opposite to those of Klamath. English is not provided with
reduplication, prefixes of form, nor with the multiple suffixes of Klamath;
it differs from it also by its more complex syntactic structure, its imperfect
nominal inflection, by its distinctive form for the nominal plural, the grada-
tion of the adjective and adverb effected by suffixation, its personal inflec-
tion of the verb, and a long array of irregular and auxiliary verbs.

● 124 Thus it will be easily perceived that the obtaining of correct and reli-
able ethnographic and linguistic information in such a tribe is fraught with
many difficulties. Sometimes it is practicable to get the terms for visible
objects by making gesture signs or by pointing at the objects, but it just as
often misleads; and if the investigator has to do with people who know no
other language than their own, he must revise his notes with many of them
before he can place any trust in what he has written down from dictation.
[191] The Indians and mixed bloods who have made some progress in the acquisi-
tion of English pronounce *f* as *p*, *v* as *b*, *r* as *l*—are modeling English after
their own language, using *he* for our *he*, *she*, *it*, *they*, *him*, *her*, *them*; all this
being hû'k, hû't, hû'nk for them. They do not know how to use our conjunc-
tions, a defect which makes all the tales, myths, and other textual informa-
tion unintelligible. The only means of obtaining results is to pick out the
best people from the crowd and to train them for awhile for the purpose
wanted, until they are brought so far as to feel or understand the scope of
the investigator. Women will be found more useful than men to inform
him about myths, animal stories, the gathering of vegetable food, house-

124 hold affairs, and terms referring to colors; men more appropriate than women in instructing him about their hunts, fishing, travels, their legal customs, wars and raids, house-building, and similar work. Omit asking them about the deceased, for it makes them angry and sullen. They do not as a rule willfully lead the investigator into error when they see that he is in earnest. Errors often originate in preconceived notions or theories and inappropriate questions of the investigator, sometimes also in the want of abstract terms in the interpreter's language. To insure correctness in an Indian myth, animal story, or any relation whatever, it should first be taken down in Indian, and of this a verbatim translation secured.

114 Ethnographic sketches of both tribes, but chiefly of the Modocs, were published in the newspapers of the Pacific coast at the time of Ben Wright's massacre, but they were not accessible to me; more circumstantial were those written at the time of the Modoc war (1872-'73), and specimens of these may be seen in A. B. Meacham's publications, in the "Overland Monthly" of San Francisco, and in Stephen Powers's "The Modok," in Contributions III, pp. 252-262.

126 Ethnographic objects manufactured by and in actual use among both tribes were purchased at different periods by collectors. The National Museum in Washington owns several of them; but the most complete collection is probably the one made in 1882 by the Swiss naturalist, Alphons Forrer, a native of St. Gall, which was partly sold to the Ethnographic Museum of St. Gall, partly (eighty-five articles) to that of Berne, the capital of Switzerland. Forrer lived several months among the Klamaths, and thus was enabled to secure the best specimens. There are two hā̆näsish or "magic arrows," an implement which has probably become very scarce now. The majority of these objects are manufactured from wood, fur-
134 skin, and basket material. There is no suitable clay found in the Klamath
323 River Highlands, hence these Indians never made any pottery.

114 The report of Lieutenants Williamson and Abbot contains a large array of astronomic positions and of meteorologic observations made during the expedition, which will prove useful to later observers. The zoölogic, botanic, and geologic reports made by different scientists were considered of high value at the time they were first published. It will be remembered

121 witchcraft only, religious feasts are orgies, divine revelation is human hallucination, and the moral element, when present in religion, is not urged upon the community. While in the religions of the white man the gods originally representing nature's powers gradually become teachers or examples of morality and mental improvement, those of the other races remain the stern and remorseless deities of the sky, the atmosphere, and the earth, whose good will has to be propitiated by sacrifice.

As zoodemonism is the most appropriate form of religion for man in the animistic stage, the majority of the mythic characters in American religions are animals, especially quadrupeds; and even the fully anthropomorphized deities sometimes assume, in Oregon and elsewhere, the masks of animals. The earlier Indians firmly believed that such animals as were the prototypes of their own species had human faculties, and talked and thought as men do; in whatever tribe there are totemic gentes or clans the members of these are supposed to have descended from that prototype of a bear, deer, alligator, eagle, or whatever animal a gens is called after. Certain qualities of man, physical and intellectual, found their closest analogies in those of animals, and the animal world is much nearer akin to man in the mind of the Indian than in the white man's mind. Scurrilous and grotesque acts ascribed to so many Indian deities were not intended for derision, as with us, but for faithful portrayings of the habits of typical animals; and zoodemonism—not exactly zoolatry, as in Egypt—is the form of religion existing among the *wild* Indians of America.

The large amount of mythologic and transcendental material obtained among the Indians requires subdivision into several chapters. I present it under the following subdivisions: *a.* Elementary deities; *b.* Spirit deities; *c.* Animal deities.

114
124 Of the mythologic data embodied in the present article the larger part were obtained by myself, but not all. The others were gathered by Messrs. Stephen Powers and Jeremiah Curtin, mainly by the latter, who obtained over one hundred Modoc myths in 1883 and 1884, now forming part of the unpublished collection of the Bureau of Ethnology.

121 more useful dates and facts. Such results as these may be confidently looked for when several dialects of one linguistic family can be compared; and a careful comparison of one language with others spoken in the vicinity, belonging to the same or a different family, will always be attended with beneficial results for the increase of our scientific knowledge.

● 124 127 The aboriginal literary monuments printed below are authentic national records of a brave and industrious mountain tribe of Indians. Ethnologic notices have at a comparatively early period been gathered concerning the Modocs and Klamath Lake Indians, but most of them were of doubtful scientific value, because the information was gathered from them in the English language, which they understood but very imperfectly. Even now, the dates and facts recounted by them, as well as by Indians of many other tribes, in English, are so extremely confused, that only texts written in their own language can give us a clear insight into their traditions, myths, and mode of thinking.

538 No Indian tribe possesses a history of itself reaching back further than two or three generations, unless it has been recorded by whites at an early date, and what goes beyond this limit is tradition, on which we must be careful not to place any implicit reliance. But mythology records in a certain sense the intellectual history as well as the metaphysical ideas of a people, and thus by the gathering of the numerous mythic tales and legends of the Máklaks a start at least is made for the investigation of their intellectual development. A very moderate estimate puts at several hundred the more generally circulated myths of the Klamath Lake or É-ukshikni alone, and the number of their popular song-lines, so interesting and unique in many respects, may be called infinite, for their number is increased every day by new ones. The bulk of their mythic folklore is of great poetic beauty, freshness, and originality, and, like that of other tribes, full of childlike "naïveté." This latter characteristic forms one of their greatest attractions, and the animal myths of every uncultured people will prove attractive, because they were invented for religious or poetic and not for didactic purposes. [173] To some of the myths given below we may confidently ascribe an antiquity of over three centuries, for their archaic terms

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

58 [173] and locutions, repeated from generation to generation, are not always understood at the present day by the young people, who most attentively listen to the aged rhapsodists, when they expound these miraculous stories in the lurid glare of the nocturnal campfire. Nothing in them indicates a migration of these upland tribes from any part of the country into their present homes, and hence the Máklaks must have had undisturbed possession of the headwaters of Klamath River for some centuries prior to the advent of the white population.

197 58 124 The various texts obtained clearly exhibit the character of the language actually spoken and the difference existing between the two dialects, but they do not all possess the same linguistic value. The texts of Dave Hill and others are worded in the conversational language of the tribe, which in many particulars differs from the more elaborate and circumstantial mode of speech which appears in the mythic tales given by Minnie Froben. 124 126 The "Modoc War" and some of the shorter pieces could be obtained only by putting down the English first and then getting sentence for sentence in the dialect, whereas the best worded stories and specimens were written in continuous dictation. All texts obtained were carefully revised first with the informants, then with other natives, and all the necessary explanations added at the time.

533 From a purely linguistic view the popular songs or song-lines are the most valuable contributions. The melodies of some of their number deserve to be called pretty, according to our musical taste. To the natives all of them appear harmonious; but when the Western Indian calls some melody "pretty," guided by his musical principles, he very frequently does so in opposition to what our ear tells us to call by this predicate.

124 191 The Klamath Lake dialect was spoken by the majority of the contributors to my linguistic anthology. I obtained these specimens, with the exclusion of the Modoc texts, in the autumn of 1877, at the Klamath Reservation, Lake County, Oregon. Though many of these natives speak the Chinook jargon more fluently than English, I never availed myself, for obtaining any information whatever, of that imperfect and hybrid medium, through which the Indians of the Northwest carry on so much of their intercourse.

NOTES.

[124] 16. Dave Hill took part himself in one of these skirmishes. His historical accounts are all given in the conversational style, which almost throughout substitutes the [175] simple *s* for *sh*. I have not been able to determine the exact dates of these Rogue River raids; but they must have occurred before the end of 1855, when the Oregon war broke out, for after its termination most of the Rogue River Indians were removed from their old homes to the coast reservations of Northwestern Oregon. The raids occurred in the early youth of Dave Hill, who was born about 1840; so they may be placed between the years 1848 and 1855.

173 *539 726 19

16, 2. tínatoks forms antithesis to tína of the preceding clause. The literal meaning of both is: "one time ..... the other time."

16, 3. Wálamsi. The suffix -i, -í, is the adverbial particle hí, and forms a *locative case*, mainly found in local and topographical terms, as in Yámsi, Kakágosi, Ktaíwashi; also in a few generic nouns designating localities, encampments, mountains, etc.

16, 5. shûshû'dshapĕllsh. The suffixed -sh is the pronoun sha, *they*, and in this suffixed form also appears as -tch, -s. This verb stands in the distributive form; shúdshapĕli, to rebuild a fire, being the absolute form.

16, 7. nánχatch, for nánχa tchish, "others also".

16, 10. yákanuapkuk, verbal causative of the future of yákna. The forms yă'kna, yă'ka, yékna, yéka, are preferable to yákna, yáka.

[727] 16, 11. sá-atsa. It is a common custom among western, and some eastern, wild tribes to force their captives to dance in honor of the victory gained over their own tribe. This is done especially during the scalp-dances.

16, 14. Titná lû'ka, etc. Here begins the account of a raid made by the Rogue River Indians upon the Klamath Lake settlements. It may have occurred one year after the raid previously narrated.

16, 15. sapíya, etc. After escaping, he informed his own countrymen of all the local conditions of the Klamath Lake people and their country, and used all his topographical knowledge in guiding their warriors to the attack.

17, 1 and 2. Tsúi nĕ'lka. Indians and uncivilized races in all portions of the world begin their raids upon the enemy before dawn, or at the earliest appearance of daylight.

17, 9. gäkán and gekuánapka, inflectional metathesis for gäkná and gekánuapka.

17, 14. huṣhtchŏ'ktat for hushtchŏ'kat ăt, ăt (*ye*) being repeated twice.

17, 16. tsókapks tcha is a contraction from tsokápkash tchí'sh a.

17, 17. Tchíssa, for tchí sha: thus they.

17, 20. sellólok: synizesis of the longer form shéllualuk, shellualúga: through fighting.

17, 21. yuyálks=sitk, abbreviated from yuyálkish=shítko, looking like persons mourning over their lost companions, or made sorrowful by bondage to Indians of a foreign tribe.

*539 683 551 756 64, 1. Tetĕmádshish or Aunt Susie is one of the numerous female "doctors", who eke out a scanty living from some patients of the Klamath Lake tribe. She received the above name for having been a washerwoman to the soldiers stationed at Fort Klamath, and the nickname Wúya-ak was bestowed on her on account of her predilection for small sucker fish.

64, 2. sämtsálχa. The means employed by her to discover that Dr. John had cast upon the patient a spell of a deadly character, were the singing or recital of tamánnash songs, and the *dreams* which she had on that subject. Her tamánuash songs had *seen* those of the accused conjurer. See 65, 9. The great majority of the tribe still believes in the possibility of witchcraft.

64, 7. The two sentences contained in this line anticipate the result of the whole trial, and the popular verdict. The proper place for them would be after 65, 15.

64, 9. Tuá ni etc. The defense made by Dr. John in his own case is not an unable one, nor is it devoid of oratorical powers. But if the arguments were delivered in the order as given by Dave Hill, they ought to have followed each other in a more logical order to attain their full effect.

64, 10. wák lish etc. The logical connection existing between this sentence and the foregoing has to be supplied by: "why should he have been my personal enemy?"

192 64, 10, 11, 15 etc. i, ik stands here for ät (*ye*); because, when the headchief is addressed in council, all the others are addressed also. Lóli stands for lóla i. The trial took place on Williamson River.

64, 13. kúkamtchish. The distributive form is used here instead of the absolute verbal k'mû'tchish, because old age comes on *gradually, by degrees.*

64, 16. tchi ínsh instead of tchi nish; the language likes juxtaposition of two short equal vowels, even when a metathesis is required.

65, 8. Kátak etc. Aunt Susie's opinion, given just after Púkish's death and some time *before* the trial, did not fail to have a striking effect on the superstitious judges and tribe, for her arguments perfectly agree with the national ideas. But to us the arguments seem so weak, that no conviction seems justified, if not based on other evidence.

65, 9. nä'usak etc. "Your defense does not disprove any of the points advanced against you."

192 65, 11. K'mukámtsam nä'-ulaks: "the old customs of the people."

124 65, 16. The second account of this tamánuash-case was obtained a few weeks after the trial; Dr. John was present at the agency buildings at the time of the dictation, furnishing the facts to my informant.

697 66, 1. ká-ishnauk etc. This underground jail was in such an unhealthy condition that Dr. John could not have lived in it through the tenth part of his long term of imprisonment.

625 66, 5. Tchikéskni and Skélag, names of two watchmen (i-álhish); the chiefs appoint watchmen from time to time. Skélag is "the young weasel" and Tchikéskni "man living at Tchikési camping-place". They were armed with pistols to foil any attempt at escape.

192 66, 10. nä'dshek for nä'dsh ak: "the only one". Compare nádshiak, 60, 21; waítak, 56, 7. and *Notes.*

192 193 66, 12. shishi'tilatk. The past participle often stands for forms of periphrastic conjugation: shishítilatko gi, they *were* carrying in their dress. Cf. illólatko, 55, 20.

*539
533
755

58. *Song of the turtle:*

Tuá ki nish lé-ula? ⏑⏑́|⏑⏑⏑⏑́|⏑

Which game did you play with me?

NOTES.

115
124

This long series of shamanic songs in use on the Williamson River was obtained from *Mary*, a young pupil of the boarding school of Indian children at the Klamath agency. When living among the Indians on the Williamson River she had heard all these songs very frequently, and in an interesting evening entertainment she faithfully reproduced the manipulations of the male and female conjurers upon a little rag baby lying on the floor on a bed made up of old blankets, the figure representing some poor suffering Indian patient. The other Indian girls of the school joined in a lively chorus every time when she had fairly started any of these incantations, and given the signal by clapping hands.

On the day following these incantations were dictated, translated and explained to me by *Minnie Froben*, assisted by Mary, and though both persisted in the statement that the order in which the songs are sung was quite immaterial, I present them here in the order in which I obtained them.

Each of these song-lines is sung many times by the conjurer, then *repeated* by the chorus a dozen times or more. The chorus varies the melody somewhat each time, but this musical variation is so slight and insignificant that the general impression of monotony is not dispelled by it. Quite a number of these songs have very pretty melodies, but by long repetition even these must of course produce tediousness and disgust; other songs have weird and strange tunes, others are quaint, but almost repulsive by their shrill accents; these may be said to form the transition to the mere howls and imitations of animal voices, which are frequent also in doctoring ceremonies, but more frequent in the war-shouts and funereal cries and wailings.

The animal or object of nature to which the conjurer attributes each of the song-lines was not remembered in every instance. Where this reference was obtained, it was added at the head of the song or song-line. The animals mentioned in these songs are all supposed to have been sent out by the conjurer to look out for the whereabouts of the *personified* disease, from which the patient is suffering, and whatever the conjurer sings about the animals refers to what he sees them doing while on their errand. On the distinction made between shul'sh and shuinō'tkish cf. *Note* to song 9.

Kiúksam shul'sh is not merely a conjurer's song, but a mysterious agency connected with a spell of preternatural power. This spell is not exclusively attached to a song sung by a conjurer, but it may be borne also by a dream, disease, by some drug, or by that kind of witchcraft which is called elsewhere the evil eye. Kiúksam shul'sh is therefore a beneficial or destructive tamánuash agency, which when applied to a patient can cure him or make him worse; when appearing under the shape of a dream, it is a dream of good or one of bad augury.

The conjurer sometimes diversifies his songs, all of which are sung in the *minor* keys, by inserting spoken words relating to the condition of the patient and the effects of his treatments; specimens of this are given in 38. 54. 55. Parts of them are also repeated by the chorus.

*539
533

Lû'baks, klépki kiúksam shuí'sh, tsé-usam skû'tätk, tsé-usam tsúyätk,
White chalk red paint are doctors' songs, tchê-sah-dressed, tchê-sah-head-covered,
tsé-usam lā'sh, witkakísham lā's.
tchê-sah-feather, hawk's feather.

Kat'sitsutsuéas kiúksam shuísh, kat'hiáwash, lû'luks-skû'tchaltk,
Snow-flake witchcraft is a doctor's song, hair-tying, in fire-robed,
skû'ksam hä'kskish, hä'näsish.
spirit's walking-staff, conjurer's arrow.

NOTES.

[124] All these subjects of tamánuash songs were obtained pell-mell and jotted down in a confusion. A clear insight into the quality of the songs known to this Indian could be attained only by classifying them into categories, as those of natural agencies, the winds, rocks, genera of animals, plants, tools and articles of native dress. Morgan had heard all these songs sung in former years, but when I met him he could remember the texts of those 71 songs only, which are to be found from page 164 to page 171. Many songs of this subject list are sung by the Modoc conjurers also.

*539
533
192

Certain names of uncommon species of animals could not be rendered in English for want of information; to others the Dictionary will afford the best clue.

[193]
[866]
179; 4. káwam or ḵáwam is a possessive case, requiring as its complement ámpû or ḵóḵe, koḵeága. To bathe in eel-springs is deemed to be of great influence on character and personal courage, for the constant peril of being bitten by crabs, snakes and other reptiles must necessarily make the bathers scornful against sudden pains.

179; 6. tsû'χatχant, or in its full form: tsûχatχántko, has to be connected attributively with the foregoing word: taákiag tsû'χatχantko "a restless boy, a little boy unable to keep quiet on his seat."

[193] 180; 1. taaskáya wéash, kólta wéas show the apocopated form of the possessive before a vocalic sound. This is another example of the rule that Klamath seeks rather than avoids *hiatus*. Cf stsá-usa-wálks 168; 45; 180; 23, and *Note* to 168; 41.

180; 5. spû'm; said to be the female of the fat shkä'-bird. There exist conjurers' songs about both, which I have given in this volume, page 167; 36. 168; 44.

180; 10. póp-tchíkash seems to mean the "drinking *or* sipping bird" (cf. pópo-i).

180; 17. Lä-a-ámbotkish, "the one which refuses to drink" seems to be a newt, Amblystoma, according to the description given of it by the Indians.

180; 17. kóä. The toad or bull-frog tamánuash song is reputed to be the most efficient of all these incantations.

180; 18. Ámpuam lák is a film-like organism moving rapidly in spirals or meanders through the water, and supposed by rustics to originate from the long hair of horses. The primary signification of ámbutka, to be thirsty, is "to return to the water", and the distributive form a-ámbutka here indicates repetition.

180; 19. The list of *plants* is very small when compared to that of the animals, and embodies economical plants only.

180; 22. wásh means *place of residence* in general; but since all the objects in [illegible] category refer to the sweat-house, it may be referred to a removal of earth in the floor of this structure; lúloks is the fire burning in the centre of it.

181; 1. tsé-usam skû'tatk: "dressed with feathers of the yellow hammer or red shafted flicker."

INTRODUCTION

114 The texts presented here were collected during the summers of 1955, 1956, and 1957 which were spent among the Klamath Indians at Chiloquin,
122 Oregon. The field work was carried out under the auspices of the Survey of California Indian Languages, Department of Linguistics, University of
115 California, Berkeley. The narrators of the myth texts were Mr. Robert David, Mrs. Pansy Ohles, and Mr. Grover Pompey; the ethnographic materials were obtained from the first two of these and from Mrs. Aggie Butler, Mrs. Grover Pompey, and Miss Irene Skellock.

126 Most of these texts were recorded directly on tape, but some were taken down first in dictated form and were taped later. Of the myths, only Texts 1 and 7 were not recorded on tape. Of the ethnographic materials, Texts 24, 25, 29, 30, 31, and 35 were dictated only.

[124] No really exhaustive attempt was made to obtain a complete collection of Klamath myth texts. Instead, the author aimed at a representative collection of materials, including myths told by several informants, autobiographical experiences, ethnographic texts, historical incidents, conversation, and also the responses to a series of elicitation pictures (Text 39). It was felt that these texts would provide, on the one hand, good illustrative material for further linguistic studies in Klamath, and, on the other hand, a representative sampling of myths and ethnographic material of interest to the folklorist and ethnologist.

114 The collections of Klamath myths so far published are limited to A. S. Gatschet's "The Klamath Indians of Southwestern Oregon (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890) and some brief song and medicine texts in Leslie Spier's "Klamath Ethnography" (University of California Publications in American Archaeology and Ethnology, vol. 30, 1930). More recently, Dr. Theodore Stern of the University of Oregon has collected a large number of Klamath myths. The author understands that Dr. Spier also possesses a collection of myths. It is urgently hoped that both of these will be published in the near future.

128 The present collection is divided into two major parts: Myths, and
773 Ethnographic Texts. The former contains tales about the inhabitants of

NR10 Klamath NR10

Introductory Note to Text 4

124 After giving the foregoing three texts, Mrs. Ohles was strongly hesitant about giving more. She felt that she had forgotten too many of the details which make the text "correct" to a good Klamath storyteller. She pointed out that she could neither recall the names nor the kinship relationships of the lesser characters, and she felt that she was omitting incidents and garbling the action.

At last, however, Mrs. Ohles kindly agreed to relate all she could remember of the story about the red-haired woman of Sprague River. She had previously narrated this in English to the author, up to the point where Gmoḱaṁč enters the story. She began the myth with the [126] author recording it in his notebook only (she felt the tape recorder might confuse her), but after she had gained confidence, the remainder of the myth was tape-recorded. When she reached the end of her previous English narration, she continued with incidents leading into the Gmoḱaṁč myth—much to the surprise of the author, who had not seen versions of the Gmoḱaṁč story beginning in this fashion anywhere else. The stimulus for this may have been provided by Gatschet's recorded texts,[15] which the author had shown her some days previously. At that time she had recalled these myth incidents easily as part of the corpus of material she had heard in her childhood and since forgotten. With this as a crutch to memory, she produced the text given here. She felt that her version was more generally correct and that Gatschet's texts were only short incidents taken from a long cycle of connected [538] incidents. This cycle, she said, might take three or four days in the telling by a really proficient storyteller. The action and final conclusion of her version she felt to be correct, but she was sure that many minor incidents and characters had been omitted.

This text differs from her previous ones in that it is more conversational and less formal in style. She comments in English and Klamath on her story, makes side remarks to the author and jovially berates him for getting her to tell a story she only partially remembers, and breaks into English at difficult points to supplement half-remembered "hard words." Mrs. Ohles' style in this text is valuable as a sample of less formal Klamath discourse. She contrasts strongly

here with her previous impersonal narrations and with the even less personal text styles of other informants, whose stories and ethnographic material were always given as objective verbal "essays." 124

---

[15] Gatschet, "The Klamath Indians of Southwestern Oregon" (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890), pp. 96-132, 142-143. The present author read some of Gatschet's texts to Mrs. Ohles, and she was able to recall other incidents and versions.

Some time after the text was recorded and analyzed, the author felt the need of having the entire myth on tape, rather than half in notebook form and half on tape. Mrs. Ohles kindly agreed to begin the story over again and told it right up to the point where she had switched to the tape-recorder before. This second tape-recorded beginning is appended to the text and serves for a comparison between pen and notebook dictation and tape-recorded discourse. [126]

Mrs. Ohles felt that material irrelevant to the story should be stricken, since it made the story "incorrect." The author feels, however, that such side remarks illustrate Klamath conversational style and give insight into her attitudes toward the myths and towards other facets of semi-acculturated Klamath culture. This material is, therefore, reproduced within parentheses both in the Klamath text and in the translation. Her English remarks are conventionally spelled but otherwise unchanged. [128]

---

[196] [17] This means literally "And [she] caused to stick together, on the back." It seems to imply "back to back."

[201] [124] [18] Literally, "And now, having done this way, it came back down." At this point Mrs. Ohles gestured to show how the boy's arrow fell; i.e., straight down, point first between the little boy and his sister, cutting the pitch which held them together. /geḿas gyank/ "having done this way" refers to Mrs. Ohles' gesture.

*539 (80) čoy honk naʔas gi, "sʔabi· ʔis na·ĺs, sʔabas! (81) dwa· ʔa na·t waq giwk, q̓elẏak ptisap, q̓elẏak p̓kisap?" (82) čoy honk q̓ay sas geqč̓a. (109) čoy honk naʔas, "q̓ay dak sa dwa· waq gi." (But she'd be scared, all the time, you know. She knew that little girl would cut off her mother's head when she came out of water at night, and she was afraid she'd find it in there with the fish.

---

[201]
[124]
[19] The little girl shot the sun in the cheek. Mrs. Chiles gestured to her own cheek here to clarify this, and /ho·t gida gwena, dalč̓iʔam/ "it made a mark right here, of the arrow" refers to her gesture. She later remarked that the black spot is still to be seen on the sun's "cheek" and suggested it might be an Indian explanation of sunspots.

[192]
[124]
[20] The utterance /gočgočgočgoji·p/ was given in a loud whisper. It is apparently a mythic utterance, a distortion of /pgoji·p/ "aunt, father's sister." The action here was later clarified by Mrs. Chiles. Each time the two children went torch-fishing, their Aunt would appear from the water, leaning into the boat and crying "/gočgočgočgoji·p!/." The children remained perfectly still, hoping that she would eventually lean far enough into the boat for them to seize her and cut off her head. Their Grandmother, sitting at home, heard her daughter each time and knew the children would kill her. Hence her repeated sob, "/hãhãʔ!/." (The symbol "ã" denotes a nasalized low central vowel. The utterance is anomalous to the phonemic system.)

[194]
[193]

#539 waq nis gist. (195) ʔaMḱa hok gida lobi· gatbanwapk, wage·nha no·s hok lobi· gaẃalwapk. (196) q̓ay da·ts ʔi woswapk!" (197) ʔat sam we·ḱa gitk. (198) we·saltk sa ʔat. (199) čoy honk ʔat spodo·ča. (200) čoy honk hok sńewe·ts do···m ʔankẃala, do···m.

[196] [34] Utterances 202 and 203 are given in a high, faint voice, indicating the Grandmother's age and fatigue.

[126]
[124]
[196]

[35] The remarks in parentheses here are addressed to the author, who was holding the microphone too close to Mrs. Ohles' face. It is interesting to note that she spontaneously treats the microphone as a "round object" (e.g., ‖ˇl·elgi!‖ "Put down a round object!"). The author, as an outsider to the Klamath world-view, might have been tempted to treat it as a long object or even as a rope-like object.

4539

("Step on me here!" Of course, that's what this maiden wanted to do was step on her, so that those rocks would cook her.) (235) čoy honk ʔat gisiga (or gisWa—or something. I can't distinguish either one of them.) (236) čoy honk glega hok ʔat loq.

---

[124]
[114]

[a] The author had not completed his reading of Gatschet's myths to Mrs. Chiles at this time, and she supplied the incident of the Butterfly sisters from her own memory, although it is also found in Gatschet's version in almost identical form. Gatschet's myth does not contain the incident of ʔaysis and the Porcupines, however, nor any mention of ʔaysis's new wives.

9: Barker L-5 (1955-1957) 1963

NR10 Klamath NR10

Introductory Note to Text 5

#539 This text, like Text 4 above, seems to be only a fragment of a much longer myth cycle. Gatschet's published collection[35] does not contain a story about Swa·ya, but Curtin's "Myths of the Modocs"[36] includes one myth about this character. It seems worthwhile to record Mrs. Ohles' version here in hopes that future work among the Klamaths will fill in the gaps.

[128] The text has been edited somewhat to delete false starts, hesitation forms, and irrelevant material. In one or two places forgotten material was added later at the time of translation.

5. The Story of Swa·ya

(Mrs. Pansy Ohles)

#539

(1) dińa· hok swa·yaʔa·kĺam ṕkisap čoy ptisap datksi či·ya. (2) čoy honk koẃe hadakt sas wetdatga. (3) hiswaq́ḱa hok hadakt dič Jle·ḱatk, dič sle·ḱa gitk. (4) čoy honk na·nok waytas honks snempatbli, hok koẃe. (5) čoy honk snaqtanča hoḿas snempatčńank goq́a·kĺatdat.[37] (6) snempatblidamnank čoy be·n spimnibli, be·n snempatčńa. (7) čoy honk kani hak naʔas, ṕkisa honk, "dam dal ʔi hon hoḿas gist we·wĺa?" (She said, "Do you trust her to do that?" And [his mother] said, "Yes, she's good. She'll keep my baby from crying, and she puts it to sleep that way.") (8) čoy honk ʔat na·nok waytas honk ʔa·di· nalk snempatčńa. (9) čoy honk be·n spimnibli. (10) čoy honk ʔat ṗalla, snempatčńank honk. (11) čoy honk dola mbaĺwank gena.

(12) čoy honk ʔat do· gatbambli, do· hak honk či·ya—dam ẏayńatdat, wage·nha ʔewsdat, wage·nha dat hak honk či·ya. (13) čoy honk sʔa·Maks honk geli·danga honk, q̇oyse·ẇok honk, do·st hok či·ya. (14) čoy honk

---

[35] Gatschet, Albert S., op. cit. See p. 22 above.

[36] Curtin, Jeremiah, Myths of the Modocs, Boston, 1912.

[124] [37] Mrs. Ohles later elaborated upon the action described here. Frog takes baby Swa·ya and places him upon a leaf (or some such thing—Mrs. Ohles was not certain just what) and lets him float down the river, then pulls him back in again by a cord. This soothes Swa·ya and puts him to sleep. She gradually extends the cord until he is completely out of sight. Then she jumps in and swims off with him.

*539 naʔas gi. "ya···, dat dal ʔi gen?" (15) "do· ʔan—gen datksi hak."[28]

(16) čoy dwa· hak sa slandi·la. (17) dwa· hak honk haslandi·lank, mna gis sʔaba, čoy honk naʔas, "ʔa···, q̓ay dak! (18) ʔat hay mis na·t spončanwapk doʔot." (19) čoy honk kokw̓eʔa·k bil mbambal̓i·na, dada·t sa honk wLič́a honk skodas. (20) kokw̓eʔa·k bil, mna we·w̓anwi·k bil na·nok. (21) ndanni ʔaky̓a sa honk gego· hom̓as gist. (22) čoy sa honk naʔas, "p̓alla dak ʔi gen!" (23) č̓osak gelga hom̓as.

(24) čoy honk ʔat mo·ni gi. (25) mo· glega, hiswaqs. (26) čoy honk naʔas gi. "q̓ay ʔi gen dada· q̓oy mi giwapk, tatbisa." (27) čoy honk naʔas, "i·, q̓ay dak sas ni." (28) čoy honk ʔat kani sʔabi·ya naʔas, "p̓allasti· hay ʔi gi." (29) čoy honk swa···qča, swaqča. (30) "dwa· ʔi gen waq giwk swaqča?" (31) q̓ay honk p̓an, ʔat honk swaqča, č̓osak, kal̓am hak naʔas gist.

(32) čoy honk hok kow̓e, dat hak honk geno·k, naʔas gi, "dič ʔi sas giwapk! (33) q̓ay ʔi sʔasʔa·wapk!" (34) čoy honk naʔas, "ʔi·." (35) čoy honk pipi·ks sas honk sʔotl̓i·ya. (36) čoy hahastamnis. (37) čoy honk sa waw̓a·lwi. (38) čoy sas honk lwela, na·nok. (39) čoy ʔat goykaga, swa·ya hok ʔat. (40) honk lis mna totbaksa na·nok lwelč́a, čoy honk qp̓aqp̓la·k̓itk honk waw̓a·lwi, loloqsdat.

(54) čoy honk be·n kani hak gatba. (55) čoy honk gisčq̓a honks č̓is. (56) čoy honk gena. (57) čoy honk bas kani hak hosdanga—gmok̓am̓č ʔaky̓a? (58) čoy honk naʔas gi, "do· ʔams sa ga·yk̓a, mi p̓kisap čoy ptisap. (59) čoy ʔi q̓ay dwa· čew sliwapk, p̓kisap mi hok giwk, ltoq̓apks ʔeč̓as gitk, Naykslant."

(60) čoy honk gena, gena. (61) čoy honk datdadwa· hak honk gayʔa·Ya, waLgok bo·s. (62) čoy honk č̓osak honk siwga, kaky̓as hak—k̓olas, k̓oYas, q̓iMa·č—kakni hak. domi· da·ts.

---

[124] [28] Here, too, the informant explained the action in English. Frog's people do not believe that Swa·ya is her baby because he is so pretty and she so ugly. They ask her how this could be, and she explains that she gave birth to the baby on a special blanket. They prepare a blanket just as she has described, but the only babies she has are little frogs like herself. After three attempts, they declare that she is a thief.

#539 (30) hok ḱočća·ʔa·k honk ʔat mbosaks mna wa·ítga lača·ẏa. na·nok honk ćo·ks. (31) na·nok honk lača·ẏa ćo·ks. (32) "ʔat ʔa q̇e·gi be·n. (33) ʔo·č gint."

7. Old Mink and Nighthawk

(Mr. Grover Pompey)[41]

(1) čečte·sis dola ćasga·yas ʔa gatba ćasgi·psamksi. (2) ćasgi·ps naʔas gi, "hoksakdanqńa ʔa na·t wawća·k na·ĺam." (3) čečte·sis naʔas, "q̇ay ho·t gew waća·k. (4) q̇ay hoksakdangwapk ʔa na·t." (5) čečte·sis naʔas gi, "ho·t dak tapẏap gew."

(6) be·n naʔas ćasgi·ps, "q̇ay, ho·t dići· siso·gis sitk sle·a. (7) hoksakdanqńa ʔa na·t honkẏes!" (8) čečte·sis naʔas gi, "ʔi·." (9) ćasgi·ps naʔas gi, "ʔi lobi· gi. suksuksuksuksuk, gapga gwaća·sis!"[42] (10) hok sedalo·ga ćasga·yas.[43] (11) ćasga·y honk ʔat ʔi·me ʔalamna qe·matdat. (12) ćasga·y honk ʔat siwga, ʔi·metga.

---

[126] [124] [41] This text was not taken on tape, but only by dictation. Mr. Pompey stated that this incident was but a small part of a longer myth cycle, though he could not recall more than fragments of the rest of it. Cf. Mr. David's text in which Ǫalo·qa·qaqs appears (Text 17).

[196] [42] The sequence /suksuksuksuksuk/ is almost voiceless, and the syllables are uttered at a rapid rate of speed. This and whistling were said to be the commonest methods of calling a dog in ancient days.

[231] [193] [196] [43] The use of (se̱) "reflexive-reciprocal action" (2pv) is not clear here. ‖se̱delwga‖ means "attack each other" or "attack oneself," but the utterance contains an "accusative" /ćasga·yas/. Utterances in which (se̱) has reciprocal meaning invariably have all parties to the action as subjects.

*539 (4) čoy naʔas gi, "dwa· lis ne·pga? (5) waq ho·t giwk nońatía goni·—he· delča! (6) he· delča!" (7) čoy honk lo·s delčńa. (8) čoy honk ndoga, mna ńos honk ndogank siwga. (49) čoy ʔat be·n hak hon sponne·ksdat honk.

(50) ʔona· be·n hak, čawal, hehǯi·ḱa. (51) čoy Na·s hok be·n ʔat lo·s hontgalčapga, ʔona·. (52) čoy hońas hak hemčipga naʔas, "loha·nk, loha·nk, loha·nk, goda· ni ṗača. (53) loha·nk, goda· ni ṗača."

---

[196] [47] The Grandmother's exclamation, here /ʔe···/ and elsewhere /ye···/ (utterances 46, 55, and 96), is uttered in a high, quavering tone that varies considerably in pitch.

[124] [192] [48] Mr. Pompey here became confused momentarily between the Klamath summer house (/wqepĺaqs/) and the winter house (/loltḿalʔaqs/). He had previously stated that Hehǯi·ḱa lived in a /wqepĺaqs/ at the time of the story.

9. Skunk and His Sister-in-Law

(Mr. Robert David)

*539 (1) sʔabwapk ʔan—wiḱa·ńs gin hemkanks, kant ni sʔaywakta. (2) ga·ʔa·k ʔans—ma·ms ni q̇ay q̇a sʔaywaks. (3) čoy da·ts ni nent domna, kant nis gogmčatk sʔabi·ya. (4) ga·ʔa·k. (5) sʔasʔapǥle·ʔa sa. ---

[194] [61] The allophonic pattern of /kalambya riba/ "Columbia River" is entirely Klamath, except for the anomalous /r/.

[124] [196] [62] Mr. David gestured to his head and back to indicate Skunk's stripe, the area referred to by /gida/ "here" and /gidaĺ/ "toward here."

[194] [192] [63] /gen ni geńs ḱleč́a/ "This is the way I hop along" is the myth speech tag-line for Skunk in this myth. It is pitched slightly higher and is rhythmically stressed. Mr. David himself points out the difference between such "myth speech" and ordinary discourse in Sentences 42 and 43 of this myth.

#539

wiḱa· bańi. (36) čoy naʔas da·ts honk sńewe·ts mna honk sʔabi·č́a. "he· ni nqenkangwapk. domnwapk ʔins honk! (37) he· ni hont g̣og̣e hamḱo·wapk, gepgablis sańa·Wawliwapk."

---

[19] [56] The sequence /?o···Í, ?o···Í/ represents Dove's cry and forms the onomatopoetic basis for this bird's name. This utterance was given in a faint, high, far-away voice. The faintness of Dove's cry made SqeÍam̓č's pursuers believe that he had outdistanced them, although he was really close by.

[124] [57] At this point Mr. David recalled a portion of the story which he had omitted. He explained that it should have been inserted somewhere near Sentence 82 of the present text. Sentences 107 through 111 are more or less a résumé of the action, resulting in the killing of Le·w. Sentences 104 through 106 were improvised material giving continuity to the story in spite of the error. Sentences 112 through 127 form the main part of the omitted section.

---

[59] The form /wgaps/ is doubtful. This is what seems to be from the tape, but Mr. David was not certain of it on hearing it again, nor could he reproduce the utterance. He felt, however, that the translation given was what belonged there.

[124]

539*

he threw it as he ran, that person. (41) Now he ran back home, came running back here for good. (42) Thus the little old lady, [that was what] she did once. (43) That's as far as I [know].

Introductory Note to Text 13

[124]

This is essentially the same myth as that given in Text 2 by Mrs. Ohles. There are, however, some interesting points of difference: Mr. David's version employs a less elaborate method of tricking Antelope out of his eyes, and the ending of this text has also been expanded to include an episode in which Gmoḱam̓č replaces Antelope's eyes with better ones made from clay and mica (as was explained later in English by the narrator). The story is thus given a "happy ending," and a mythic reason for Antelope's protruding eyeballs and exceptional vision is also included.

13. Coyote and the Thunder Bird

(Mr. Robert David)

(1) I will tell about some Coyote or other, that I know. (2) Once he was wandering there on the mountain, that Coyote. (3) And he heard it, thunder (4) It was thundering. (5) And he said, "What is that thundering? (6) What is doing that?" (7) And he looked, [but] did not see it. (8) And it kept on thundering. (9) So he searched, [for] he wanted to see what was thundering, that Coyote.

(10) Now then he saw it. (11) And sitting up high, a little bird like that, he [was the one]. (12) The Thunder Bird, as they called him, people—the Thunder Bird, he was thundering. (13) Yes, the Thunder Bird, as that little bird is called. (14) So he saw him. (15) "Are you the one making all that noise?" he said. (16) "Is it you thundering? (17) How did you do it?" he asked him, that Coyote. (18) "Doing this way," he said, plucking out his eyes. (19) Then he threw his eyes up, very, very high. (20) He threw them up, that little Thunder Bird. (21) Yes, throwing them up, having taken out his eyes. (22) And he said, "Do it this way, and then it thunders."

(23) Now then he did something—"Ya···, you do that well!" said Coyote, "Can I do it that way too?" he said. (24) "Do it thus!" he said, "Having

---

[124] [64] The reference and exact translation of this sentence seem doubtful. This text unfortunately could not be checked over with Mr. David, and other informants were unable to supply a completely satisfactory translation. Mrs. Ohles felt that Mr. David had here injected a brief reference to the dreams in which spirit-power appeared.

[124]
[776]
[67] Mr. David changed to English after finishing this text and related some further incidents about the Gaga·ńa. They were tiny people, he said, who dressed strangely and were sometimes naked. They lived out in the timber but were especially numerous around Summer Lake (/ʔiwwa/). They were seen not only by the Klamaths but by other tribes and by white men as well. He described one such occurrence in his youth, when a white man driving a team of horses on "the mountain" (Crater Lake?) was stopped by a tiny little man who clung to the wheel of the wagon. All the strength of the horses was insufficient to move him. Mr. David mentioned a further occurrence in which a Paiute saw a group of Gaga·ńa playing in a meadow and thought they were children. When he tried to pick one up, he could not lift it, and its body was hard and rock-like.

[193]
[68] Mr. David did not know the exact location of /swaq̓a·delwas/. This word seems to contain {dᵊl} 45-v "to look," {ew} 10sv "into the water, flat place," and the noun ending {s}. The sequence /swaq̓a·/ is unanalyzable.

---

[124]
[194]

[73] In speaking to the investigator, Mrs. Pompey felt more at home in English, since at that time the investigator knew so little Klamath. She thus inserts /be·raldat/ "in the barrel." The phonemic structure is Klamath, except for the anomalous /r/, but ‖d̲‖ after ‖l‖ should occur as /l/, giving ‖be·rald̲at‖ : */be·rallat/.

[74] The form /sa·war/ is English, but conforms to Klamath phonological pattern except for /r/. It might well have been put in quotation marks as a form quoted from another language.

[75] /sannat/ is likewise from English. Here, however, ‖sand̲at‖ : /sannat/ as it should.

---

[124] [76] Mr. David had just been speaking about the various culture-transformers in English and had recently finished telling Text 18. The subject of this entire first section is thus one (or more?) of these powerful beings.

[194] [77] The form /de·m/ "dam" is phonemically Klamath, but might have been put into quotation marks as a quoted item.

that Modoc said once. (28) They never forgot it, [their] doing thus, 539*
[their] killing the Indians wrongfully [lit. "badly"]. 173
(29) And I have only related little bits of it. (30) But I know a great 648
deal, but I am not telling all of it, however. (31)—How the Indians used
to fight amongst themselves, always they fought even among themselves. [721]
(32) Even among themselves they enslaved someone's child, and sold it. [567]
(33) That much is all I will tell. (34) I have nothing else to tell.

Introductory Note to Text 28

This text is a continuation of the foregoing by Mrs. Butler's sister. 124 •
Both are part of a recorded conversation about Klamath history in general, 128
and no particular attempt was made to formalize the texts into "stories." When Mrs. Butler had finished her historical narrative above, the topic turned to the Modoc War, and Miss Skellock began to discuss their father's role in that conflict. Rightfully, this text should include the remarks in English which led up to the Klamath portion, and also an explanation and continuation in English which follows it. Limitations of space require that these English parts be edited and abbreviated, however.

Introductory Remarks in English

"Our father was a scout in the Modoc War. He was with the white 539*
soldiers and went to those Lava Beds where the Modocs were." 726
648
173

28. Recollection of the Modoc War

(Miss Irene Skellock)

(1) My father went there, to the battleground. (2) And he was with the white men. (3) And he was a soldier—ah—a "scout." (4) And they were falling on both sides of him, soldiers. (5) And if they shot one, the soldier behind him marched up to the front. (6) However, they never shot him. (7) And he, however, was afraid of seeing (?) those Modoc Indians only. (8) So he lived in fear, thus they said, and some of those Klamath Indians who went with him, they also were afraid. (9) And that's all I'm going to tell [in Klamath].

[TEXT CONTINUED ON PAGE 143]

539*
585

live together with that man of yours," they said. (24) "You will never leave him. (25) You will never deceive him. (26) You will give him everything. (27) You will hide nothing [from him]." (28) Thus they told them. (29) "Everything of yours [pl.] will be just one. (30) Now you will tell each other [everything]. (31) Anything at all—if someone would tell you, something, then you would tell your husband. (32) If [someone] would tell you, the husband, also, then you will tell your wife. (33) Now you [pl.] will be just one. (34) Then having become just one, then you will tell your [pl.] children in the same way, to do just thus, just as we live," said that old man, speaking, who was their father, his [here?].

(35) "So now you [pl.] will become just one. (36) We are this many living. (37) And thus having begotten children, then you will advise [them], just as we are telling you today. (38) And you must never, never forget it!" they said. (39) "If you indeed would forget it, something evil will take hold of you forever. (40) And it will always be thus. (41) Now you will hide something from him next, even something big, which you did wrongly—perhaps [something you] did. (42) If you do thus," they said, "Then something you do not want, evil, to be thus, to fall between [you] thus, then it will catch you. (43) Where we live, so you will live, being happy. (44) And so far, when we are old now. (45) So you will live together until old age with that wife of yours." (46) Thus they told them. (47) Now that's as far [as it goes].

Introductory Note to Text 35

539*
854
[124]

This is the Klamath version of "This Little Piggy Went to Market." Mrs. Chiles felt that it, or something very similar, had been used since pre-White days, but she was not sure about the details. Several of the items are untranslatable in terms of this corpus, and one, No. (6), seems to contain myth material. Mrs. Chiles thought that there definitely was a myth connected with this but could not recall it in any detail and did not wish to commit herself.

Method: The adult takes the baby's fingers one by one, starting at the little finger and ending with the thumb, reciting one of the first five words for each finger. Taking the baby's open palm, the adult taps it rhythmically and recites sentence (6). She then circles the baby's palm

[TEXT CONTINUED ON PAGE 151]

35. Amusing A Baby
(Mrs. Pansy Ohles)

(1) boqs. (2) ge·s. (3) leYas. (4) dawi·qs. (5) ƛo·l.

(6) bambaWaq, bambaWaq, sqelam tapy̓a snoy̓o·digyo·ts.[81]

(7) woy̓a·, woy̓a·, woy̓a·.
(8) dip, dip, dip, . . .

36. Teasing the Old Men
(Mrs. Pansy Ohles)

(1) momča·k wawa·ła·wa. (2) čoy ni gisčipga. (3) čoy nis gew blogo·čip na?as, "ge· ?a gepga sitti·na."[82] (4) čoy ni na?as, "dam dal hok ne· dič m̓a·s?a, qaq̓o· ma·lam p̓as? (5) síesalq̓apks sko·ks p̓ap̓i·s!" (6) čoy honk wetno·ta gembalyank, be·ya mna na?as, "?ans hok ?elga. (7) čoy če·!" (8) "waq hayč mis ?elga?" (9) "sko·ks p̓ap̓i·s!" (10) čoy sa weta·, weta···!

---

[196] [193] [81] The sequence /sqelam tapy̓a snoy̓o·digyo·ts/ was translated by Mrs. Ohles but is not fully analysable. /snoy̓o·digyo·ts/ contains (o·t) 30sv "instrumental," and (s) "noun ending." /sno/ might be (sn̲) 2pv "causative," and /y̓o·di/ might be (y̓o·) 4S-v "to shoot pl." plus (odi) 7-8v "to do transitively." Or this may be (s) 3pv "transitive" plus (n^{V}) 4S-v "to burn" plus other suffix material.

[124] [82] /sitti·na/ seems to be a nickname for Mrs. Ohles, but the investigator neglected to ask her its significance.

autobiographical incidents. The end of the tape arrived just as Mrs. Cowan was beginning to feel tired, and the conversation came to an abrupt end. 124

The tape has been considerably edited to remove false starts, English portions, fragmentary or unintelligible sections, and other such "noise." The author's questions were originally asked in broken Klamath, and this has been put into English in order not to give rise to mistaken statements about the language. As was done above, personal names have been omitted out of respect for the individuals involved. Utterances by different Klamath speakers are indicated by their initials, viz., AC, PO, and RC, and the author's utterances are marked by PB. 124 128

38. A Conversation (among several)

539*
124
[824]

(1) PO: Yes, little Coyote, on whom [Gmoḱaṁč] stuck those things—that we call cattails, which was the reason, his fur is bad.

PB: Do you know any myths?

(2) PO: Could you tell a myth to me? (3) I wonder if you would tell a myth?

(4) AC: I don't know how. I don't know how to tell myths.

(5) PO: Do you remember when the white men first came? (6) Do you remember that?

(7) AC: The girls [i.e., nurses] asked me there in the "hospital" thus, "How long have you lived, how long?" (8) So I said, "There were no white people here at all, when I travelled around here." [173]

(9) PO: How big were you, when the white men came? (10) How big were you, when the white men came—when you recall the white men coming for the first time. (11) How big?

(12) AC: Yes, I was big [i.e., "grown up"], big. (13) I know a lot. (14) I was big when they fought the war [i.e., the Modoc War], over there, across there. (15) I being big, I know a lot. (16) But there were no white people anywhere around here, there were none—thus I told those white people [i.e., the nurses]. (17) There were none. (18) Only we Indians were many around here, Klamath Falls people. (19) Many Indians' land this was, [I?] said. (20) "ʔo···," they said, "Yes..." (21) So I have lived so long, I said. (22) "You have lived a very long time," they said, "It was long ago, when there were no white people, long ago," they said to me, the girls there, from the "hospital."

[TEXT CONTINUED ON PAGE 159]

(23) PO: Would you tell something good, do thus (?) [at our] asking? 539*
(24) That's what he wants, this one, and he asked me thus, a little while 124 •
ago, "Why are there so many house-pits, on the Marsh? (25) Did they 173
live there at that time, even in the winter?" (26) And I said, "I do not
know." (27) Did they live there on the Marsh in the wintertime? [361]

(28) AC: Yes, all. (29) They lived everywhere. (30) Many there on
the Marsh too, many lived all around it. (31) They lived [there] every
day, even in winter. (32) And these Indians lived around here, many,
the same way these [people lived] also up above, all the length of the
river. (33) These living places were over there, those house-pits. [342]
(34) Thus (Proper name) said to me long ago, "What did this used to be?"
(35) So I said, "Our grandfathers used to live there, that—at that Ģome·kai.
(36) The house-pit was on this side long ago, that of my Grandfather
(father's father)." (37) Thus that (Proper name) told me. (38) It was
there. (39) And they called [them] "ʔiwli·wakni·" that house-pit lies
there, he told me. (40) And in that same way those (Proper name) are
our grandfathers, as I told [her, i.e., the questioner mentioned above in
Sentence (34)]. (41) So [she] said, "Yes, was it thus? (42) No one told
me," [she] said. (43) "Yes, these were living places all around here, [103]
this, this was Q̓ačẃe·č, this mountain—the mountain was called Q̓ačwe·č."

(44) PO: What is that Q̓ačwe·č?

(45) It is something from the old times—some myth. (46) All of the mountains were named some way. (47) Thus said (Another proper name) long ago, "What is that Čn̓iWi·ls? (48) Čn̓iWi·ĺs, what is it?" (49) We do not know. (50) We did not name the mountains. (51) Thus mountains were named thus around. (52) Perhaps when God made this, He named the mountains, thus. (53) I asked many, old persons, and they did not know it. (54) Truly they did not know it, [and] I also do not know.

[TEXT CONTINUED ON PAGE 161]

(55) It was named all up [the river]. (56) So two persons] asked me a little while ago, "Where was that Komčewi·s?" he asked me, "where there were Indians, where was it?" (57) And (Woman's name) [who is] deceased, said to me too, "Where is that Ni·Laqksi?" 539*
124

(58) PO: What is that Komčewi·s?

(59) AC: Yes, it is called thus on the Marsh. (60) At the end. (61) And [I] said, "This along the hillside is Ni·Laqksi. (62) They are all people's dwellings, that was this Sohi·yagye·ks—all along the hillside, Klamath Falls, many people lived [there]."

(63) PO: Do you know the names [of places] on the Marsh? (64)—How they are called. (65) I only remember, when I was little where we always used to go gathering mudhen eggs—at Charcoal Lake. (66) And now I can't find it. (67) And Sgotq̓aks, I cannot find it now. (68) And what the white people called "Hog Creek," where we used to go and gather blueberries. (69) So they are gone. (70) Thus I told this one, "Those blueberries are gone now." (71) And I wonder if maybe those sheep, ate them up? [103]
[222]

(72) AC: Yes, having trampled it all down in that way. (73) [Just like] this of mine [which I] had planted here awhile ago—very big around, with red blooms there—and that goat ate it all up. (74) However, it has grown back and shoots are coming there, which have something red on them, that kind.

(75) PO: What was a "goat" called?

(76) AC: I don't recall.

PB: What is a "q̓wi·l"? [192]

(77) AC: They called a "sheep" that. (78) Those Modoc Indians [called it] a "q̓wi·l."

PB: And one more, what is "swa·ya"?

(78) AC: What?

(79) PO: swa·ya.

(80) AC: Is it?—a myth, which they called little "Swa·ya." (81) Swa·y—whatever he was, I do not know. (82) There is a myth thus.

[TEXT CONTINUED ON PAGE 163]

(83) And did anybody tell this one the myth from over there, that is a 539*
good myth. (84) It is [about] Crater Lake. 124•

(85) PO: Probably no one. (86) I do not know it.

(87) AC: Yes, it is a very good myth [about] over there. (88) They told me something thus, that it was a very, very good myth. (89) However, [I] don't know it, because these [meaning her wits] are gone, being old. (Interruption.)

(90) AC: Thus he asked me, how they lived long ago.

(91) PO: Could you tell it?

(92) AC: Now he has stopped it [i.e., the machine].

(93) PO: Now he has done something—started it up again. (94) Now you can begin to tell, if you wish, anything at all. (95) Whatever you remember, tell that. (96) Now I have told it to you, and he will put it on there [i.e., on the tape]. (97) Now it is—something?—going—now it is revolving.

(98) AC: People were good, we Indians a long time ago. (99) We 539*
were good people. (100) And I have told my—we were good people long 124
ago. (101) We took even a little bit of food [i.e., all we had] for [some- 173
one]. (102) And, even though there was no food here, then we took for [431]
[somebody], something. (103) And it was this. (104) And doing it thus
it is called "They even divide up a flea." (105) Thus was the Indians'
way. (106) Thus they used to call it. (108) To someone, even a little
bit of food they took there. (109) Yes, for another, and they gave some
food, even [though it was] from a small amount, even if there was no
food, just being very sympathetic at that time. (110) Living with a great
struggle [lit. "having become very tired"], they got food. (111) Yes, [222]
even old ladies like these went off to dig roots. (112) They slung [a
basket] of this kind on their shoulders, and even the weak, now they knew
that there would be nothing to eat in the winter. (113) And because of [251]
that, they buried some food.

[TEXT CONTINUED ON PAGE 165]

9: Barker L-5 (1955-1957) 1963

NR10 Klamath NR10

539*
124 •

(114) PO: Yes, he wants you to tell that kind of thing, how they did things, to get food.

(115) AC: So we used to live this way. (116) These people used to live thus, now have [they] become different. (117) Truly they have become different.

(118) PO: [They] have become white people.

(119) AC: Yes, become different. (120) So they buy anything, they buy anything whatsoever. (121) Long ago they did not do thus. (122) They gave, they gave even a small amount of food. (123) Yes, dividing it thus, just like dividing it. (124) They lived thus long ago, helping each other, helping each other very much. (125) Now they do not do thus. (126) [One] will grasp only for money. (127) We eat only by buying. (128) Here they fish, but now only by buying do we swallow any fish.

[431)

(129) PO: Long ago they did not do thus.

(130) AC: Not thus. Helping each other very much they lived. (131) And long ago it was good, because it was thus, as I have told this one. (132) Now there is nothing. (133) Now there is no fun. (134) And [I] knew long ago, it was good, much to laugh at, something, everything to laugh at, everything. (135) There at the [Fourth of] July place Father raced them, having taken all his clothes off, only wearing his drawers. (136) And all those Paiutes doing this—now they having gone there, then they ran off and left my father behind. (137) [illegible] they roared with laughter, "ʔi···!" (138) Then that woman who [illegible] be (Proper name's) wife became angry at them, because she said [illegible] making fun. (139) Yes, they made fun. (140) "You [pl.] old people are making fun, but he is young," thus she spoke. (141) And they said, "Haja···! ya···dwa·!" they said. (142) They did not talk nicely. (143) "He is not young. (144) He is old," thus said those Paiute women. (145) Then she got angry at them. (146) And thus it was long ago, many things to laugh at, many good things, various things [were] fun. (147) Today everything is quiet. (148) Now there is no poking fun about anything.

[526]

(149) PO: I told this one thus, [once] when they got together, three, or even two, then they said, "Do you know when someone [i.e., a certain

[TEXT CONTINUED ON PAGE 167]

539*
124

one] was ever angry?" (150) And he was never one who got angry. (151) He was good. (152) I told this one. (153) They were there at ÇoWasdi, (Proper name^{1}), and (Proper name^{2}), and—who—(Proper name^{3}). (154) They were talking. (155) Someone else perhaps was talking too, whom they called "čopbaqs." (156) And they were laughing. (157) So I eavesdropped on them—I am an eavesdropper, as I told this one. (158) And he said to them, whether they had ever seen (Proper name^{2}), being angry, or perhaps in a bad mood, or perhaps annoyed. (159) No, no [one] had ever seen [him thus]. (160) Then (Proper name^{1}) said, "But I have seen him angry once." (161) "ʔa···, when?" said that (Proper name^{2}). (162) Then (Proper name^{1}) said, "When you were jerking at your horse's bridle!" (163) Then they roared with laughter. (164) Thus I told this one. (165) And I told June also, who always used to come and see you awhile back. (166) She is singing there, at Sheridan. (167) There where they call it thus, there where the Indians from all over are gathering. (168) She will sing there on Sunday, in the evening. (169) She must have arrived, there. (170) And she will sing dressed in a skin [dress], June. (171) She is my—my elder sister's daughter, who always comes to see you.

(172) AC: Yes, niece. (173) She is my [relation] on both sides. (174) I, her grandmother, to me—she considered me her little sister. (175) Yes, she called me her little sister, her grandmother. (176) So my picture of her which I was keeping, of the old lady, it is gone, someone has stolen it from me. (177) It is gone. (178) [I] thought to give it back [and] looked for it long ago. (179) I looked for it, but it was missing.

(The machine was temporarily turned off at this point.)

539*
124
262
173

(180) AC: Moss [sp. *Evernia vulpina*].

(181) PO: (I never could think of that!) How was that black one called?

(182) AC: Moss [another species]. (183) They "ate" it, ate. (184) Having "roasted" it, having "roasted" it, they ate. (185) That black moss too, they ate it.

[TEXT CONTINUED ON PAGE 169]

539*
124 •
262
173

(186) PO: I saw Little Fire [woman's name] eating it long ago—moss.

PB: What do they call a fern?

(187) PO: How is a "fern" called? (188) That which they mix in with flowers, it grows like flowers, but has no flowers. (189) "Fern," that which the white people call "fern." (190) I can't show you any.

(191) RC: That which they always used to get there on Smith River. (192) That which is something—only foliage.

(193) PO: Which are large, it grows very long.

(194) AC: "čya·wisam," perhaps?

(195) PO: How?

(196) AC: It is "čya·wisam." (197) Yes, [they] eat its leaves like wokas, which are red, those leaves.

(198) PO: No.

(199) RC: Which are long ones.

(200) PO: The like of which we put on top [of a grave]—mixed in with flowers. (201) They are only those long, long leaves. (202) Perhaps having gotten some somewhere, we can show you, sometime.

(203) RC: Before [going] there to the graveyard, people used to get flowers, and then they mixed in that sort, which are long, long leaves.

(204) AC: Those which you [pl.] call "sunflowers"?

(205) PO: No.

PB: Then what would you call sunflowers?

(206) PO: "Sunflowers," I don't know.

(207) AC: Yes, now I have forgotten it. (208) How was it called—but that was applied [lit. "long object put on"], it was medicine, sunflower roots. (209) To be applied, the ones underneath. (210) Having thus become sick, [one] rubs it on oneself, the roots.

PO: Those are the sunflower roots, but she can't remember the sunflowers.

PB: And did the Klamath eat the sunflower seeds?

(211) PO: Did we used to eat that sort?

(212) AC: Yes, they were eaten, good, those seeds. (213) And they were just like sifted [wokas], the seeds. (214) They were "lopi·li·nas." (215) Having roasted them, the pod pops up, little black ones. (216) And only the seeds being thus, like sifted [wokas]. (217) [They] tasted good. (218) Yes, the Indians ate everything, all. (219) "Popping" it all

---

[252] [192] [105] /pa·p/ is English "pop." Mrs. Cowan referred to the "popping" of various seeds, much like modern popcorn. This was done to that type of very ripe wokas called /sbokẃas/, to sunflower seeds, etc. The author had never heard of this process being applied to tule roots (/mayam lolp/).

[192] [106] /kok/ is English "cook."

[192] [124] [196] [107] /wa·l/ was mentioned by Mrs. Ohles in connection with a hastily remembered portion of a myth. She thought it was a type of root, and this is borne out by Mrs. Cowan. She repeated the name (Sentence 250) in a louder tone of voice, since Mrs. Cowan tended to be slightly deaf. To further clarify what she meant, she added Sentence 251, which is the myth speech attributed to the chief character in the myth she could not quite recall. The form /ʔoye···/ wavers off into silence at the end. It seems to be ‖ʔʷoya‖ : /ʔoya/ "gives a long object," but with modification of the final vowel.

539*
124

262

well, that wokas, tule eyes [i.e., tule roots], as they called it, white like this. (220) It was popped. (221) Indians ate everything, everything, they lived thus long ago. (222) And they lived well, they dug [roots] like this also, the Indians' potato [Sagittaria latifolia]—the Indians' "sweet potatoes." (223) Good, sweet, looking thus inside. (?) (224) But it was round, good.

PB: And what is "qlańe"?

(225) AC: "qlańa," yes. (226) It was good, even as food. (227) "Parsnips"—this just like a peeling [skin? membrane?] it bloomed. (228) Yes, it blooms just like "parsnips," but it smelled bad, that. (229) Smelled bad—it was "poison." (230) But it had blooms thus, blooming just like qlańa, however that stink of parsnips was not there [i.e., she here is speaking about "poison parsnips"—"sḱawanksam"]. (231) That was poison parsnips [Cicutum douglasii], bad. (232) It bloomed just thus, thus, like "qlańa." (233) But that "qlańa" was good—tasted good, sweet. (234) Good to eat raw also, and [as well as] having boiled and "cooked" it. [252]

PB: What did the Klamath call "garlic" or "onion"?

(235) PO: Which the white people call "onion," or "wild onion."

(236) AC: That is "pni." (237) It is from over there, something good like that. (238) They were little, like little "turnips," bitter. (239) They were in bunches. (240) They grew over there, to the east, here. (241) At Ya·ńi there. (242) [I] wanted Ransom to go and get some, to plant them, on some dry earth like this in the ground—thus there are many, many bright flowers. (243) They are good flowers. (244) However they are just like those onions, smelling just so. (245) But they have called them "pni." (246) They ate it well, the Paiutes. (247) It tasted good, sweet, having put it in a roasting pit, they "roast" it. (248) With all its skin having done thus to it, they ate it.

PB: Could you tell me what a "wa·l" is?

(249) PO: What was that "wa·l"? (250) "wa·l"! (251) "He didn't give his Granny the big 'wa·l'!"

[TEXT CONTINUED ON PAGE 173]

9: Barker L-5 (1955-1957) 1963
NR10 Klamath NR10

(252) AC: "wa·l"—it is good also. (253) My mother always used to find it somewhere, I don't know how long it thus was. (254) They were this big, here. (255) However, [they] were long, tapering, that "wa·l." (256) It tasted good. (257) I do not know it, I never followed her around long ago, when she dug that kind. (258) But she dug [for roots] knowing everything. (259) I do not know it, that "wa·l" thus.

539*
124●
[173]
[262]

(260) PO: Its name is all I know. (261) They told [about it] in myths for [us].

(262) AC: It tasted just thus. (263) It was very good thus. (Interruption, and the machine was turned off.)

(264) PO: . . . "ksegi·." (265) Why would they say that? (266) "He 'ksegi·' me," as [they said].

(267) AC: Here, close by, I am deaf now!

(268) PO: "ksegi·"—why would they say that, "He 'ksegi·' me," as [they said].

(269) AC: When he lived with me. (270) If I would live with you, there at your place, then you would say, "She always 'ksegi·' me." (271) Thus you would say.

(272) AC: Then there is one more even, just about like it. (273) "nčegi·."

(274) PO: Didn't I [tell] you so! (275) "nčegi·!"

(276) AC: "nčegi·," that is one even. (277) "Now I will take offence [i.e., "nčegiwapk"] at him." (278) "Now [I] will quarrel [with him]. (279) For a long time I ignored him, but now I take offence. (280) So now I will take offence."

(281) PO: How did you [say] it first? (282) How would I say it, if you lived with me?

(283) AC: "ksegi·."

(284) PO: (That last one means I never paid any attention for a long time, but I will now, take offence to what this other person says and quarrel with them or fight with them or whatever.) So I know it for the first time, having become so old. (Interruption.)

PB: What is a "pḱa·sip"?

(285) PO: Which is that something—Grandfather [mother's father] and Grandfather [father's father]? (286) On the father's side, or perhaps on the mother's side?

[601]

(287) AC: Yes, he is on the mother's side, that "pḱa·sip." (288) And he is on the father's side however, the "bloksip." (289) The "p̓oli·p" is

[TEXT CONTINUED ON PAGE 175]

539*

[601]

the woman on this side, the "pǩa·sip." (290) And the "bloksip," [the woman on that side is the] "pće·wip"—now they are that many. (291) On this side they are two each.

PB: And what is a "pǩo·nip"?

(292) PO: "pǩo·nip," what is that? (293) How is he related, he whom they call "pǩo·nip"?

(294) AC: The "pǩo·nip" is a brother [woman's elder brother]. (295) He [they?] would be my "ǩoǩo·nip." (Great uncle.) (?)

(The conversation was carried on in English at this point, mostly about friends from the old days.)

(296) PO: . . . And how was he called, with whom she lived—whom she lived with?

(297) AC: No, she just lived with him for a little while. (298) Something herself, even being something to each other—they were some sort of relation to each other. (300) He considered [her] father an uncle [mother's brother], his absent one.

(301) PO: Yes, I thought so.

(The conversation reverted to English and drifted to a recollection of a personal experience from Mrs. Ohles' childhood. The machine was turned off during this time and was only turned on again when she returned to Klamath.)

(302) PO: . . . And she was sick with something for a long time. (303) And she was gone a long time, gone a long time. (304) So she was supposed to be gone only three days, and she was gone much longer, because she was sick. (305) And then he left us [lit. "fell off of us"], that (Proper name). (306) Then he returned, and sickness attacked, him next. (307) Then Mama having come back, she took us back to Bligh, toward Bligh. (308) What do they call Bligh in Klamath?

(309) AC: "Blay." (310) It is on this side of the mountain.

[TEXT CONTINUED ON PAGE 177]

[124]

[111] It seems strange that Mrs. Ohles had never made the connection between "Bligh" and (blay), but this is what she seems to imply here. Since she speaks such good English, she may have heard "Bligh" always as [bla·y] and (blay) as [bla˘<y].

(311) PO: Is that so? (312) I never heard that.

(313) AC: Then Yainax [from Klamath /ẏayńaks/]—it is a little mountain, there where (Proper name) killed that white man a long time ago, on that little mountain having led him up high there. 539* 124

(At this point the tape came to an end, and the conversation was broken off.)

Introductory Note to Text 39

This text was elicited with the aid of a series of fifty line drawings, prepared under the supervision of Alfred S. Hayes, as described in his article, "Field Procedures While Working with Diegueño" (International Journal of American Linguistics, vol. 20, pp. 185-194, 1954). Each drawing depicts some simple situation, and the informant is encouraged to describe the scene and make some theorizations about what might be going on. The numeration corresponds to the numbers of the pictures. The separate utterances are not otherwise numbered. 125

39. Response to Pictures

(Mrs. Pansy Ohles)

(1) What is he pointing at that tree for? One man seems to be pointing toward that tree, unhealthy [lit. "bad looking"], very thin. And what is this? A road, perhaps, I do not know. 539* 125

(2) These are two men. Perhaps they are walking around to plow or perhaps to cut hay. This one is pointing, one. And this tree stands in the open, alone.

(3) So these are three, four men also. These are four men. And one little boy way over there, but these are large. Again this one is pointing. What are they pointing at? I do not know. However, a road is running along—isn't this a road running along?

(4) Two men, one is running toward the tree. Perhaps he will relieve himself. But this one, I don't know what they are doing. Again he is pointing. What can be over there? And these are two roads.

[TEXT CONTINUED ON PAGE 179]

APPENDIX

KLAMATH PLACE NAMES WITH MAP

128

The accompanying map of place names has been largely adapted from 127
Leslie Spier, "Klamath Ethnography" (University of California Publica- 103
tions in American Archaeology and Ethnology, vol. 30, 1930. The present 114
writer has checked and retranscribed most of Spier's forms: only seven [124] •
of Spier's place names could not be obtained from the author's informants. No attempt was made to recheck Spier's supporting geographical and ethnographic data, however.

Ninety-two new place names have also been added to the map. Many of these are not settlements (as Spier specifies for his list), but are places used for food gathering, places named for some outstanding natural feature, places named after some mythological person or event, etc. The author has appended what descriptive material he could obtain to each new place name in the list.

Forty-five additional place names are not shown on the map but are 128
included in the Dictionary. These are either uncertain as to location or 103
are places not found within the limits of the map.

The map has been renumbered to accomodate the new place names, [127]
but Spier's original numbers are given after each entry for purposes of
comparison. It must be noted that geographical locations on the map are [124]
only approximate and in some cases quite hypothetical (e.g., where the informant could only recall that a given place was "about two or three miles over that way").

Forms are given in phonemics only and are translated wherever possible. The morphophonemic forms of these names are listed under "place names" in the English-Klamath section of the Dictionary, along with some indication of their morphemic content.

CULTURE ELEMENT
NORTHEAST

B

ERMINIE W.

INTROD

121 The list of elements used in the field for this study was assembled from six other lists for adjoining areas which had been gathered by members of the culture-element survey and were still in manuscript form. Dr. Driver, Dr. Kroeber, and I collaborated in preparing the list which I was to use. It contained some 5500 elements. While working in the field I added and occasionally subtracted elements and often reorganized entire sections of the list; in the final preparation of the manuscript further reorganization was effected. I consistently attempted to keep complexes of elements together, in order to present a more intelligible picture of the patterns of the various cultures as wholes. This was not an easy task, since elements tended to be regrouped, in kaleidoscopic fashion, among the different peoples studied. To help solve this difficulty frequent use has been made of cross references in the ethnographic notes which accompany the lists.

124 With respect to field method, I found that working with an element list is a definite aid 125 in making quick rapport with informants. Several of the sixteen informants interviewed repeatedly expressed both astonishment and respect when the questions I put to them from the list hit the cultural nail squarely on the head. Far from a list deterring informants from volunteering information, it obviously stimulated comments. All volunteered information, unless it came at too rapid a rate, was jotted down in a separate notebook which was kept open beside the element list itself.

I should like to emphasize here that while questioning informants I never used the element list in the rigidly mechanical "yes or no" fashion which some critics of element-list work take for granted as being a part of the field technique. The content of the ethnographic notes appended to the element list itself bears witness to the fact that informants were not only willing, but anxious to elaborate on the questions put to them. Some queries, such as whether the floor of a winter house is dug out or level with the ground, could be asked directly and a yes or no answer relied upon. But if the answer to this question was merely "Yes" the query "How deep?" always followed as a check. The answers to other questions, such as number of directions, month names, seasons, or whether the autonomous group consists of a single village, a group of closely adjacent villages, or a com-

[47-A]

DISTRIBUTIONS: XX
CALIFORNIA

. VOEGELIN

'UCTION

124 munity of clusters of settlements, obviously
could not be given directly. For questions such
125 as these, specific data were collected, as for example, native names for directions, months, seasons, data on village groups and the headmen or chiefs of such. The same is true for questions relating to exogamy, marriage, and other social customs.

As one worked, intensively and rapidly, with a detailed orderly list of questions on which to rely, needless repetitions with the same informant and dawdling over data approached the vanishing point. In no other way can I explain how within the space of four or five days as much information as is contained in an element list is collected. Previous to working on the survey, I
000 had made three successive summer field trips to the Tübatulabal, spending in all some eleven weeks studying Tübatulabal ethnography, and three much longer trips to the Shawnee to collect material for a Shawnee ethnography. My chief regret concerning both the Tübatulabal and Shawnee field work is that so much time was squandered because the only sort of lists I carried were of the hit-and-miss variety that one generally makes up preparatory to and during field work. The longer trips naturally afforded more opportunity for collecting mythological and ethnobotanical data, for example, than it was possible to gather while doing survey work.

After completing this survey I had the opportunity to use part of my California element list for questioning one of my most reliable Shawnee informants. Although the list I used was not assembled for an eastern group, I was agreeably surprised on two points: (1) that the informant stuck to the point of the questions and often volunteered pertinent additional information, and (2) that by trying out the list I uncovered the presence, among the Shawnee, of a game concerning which I had never before been able to secure information, and also obtained data on several items of material culture that heretofore had been missing from my record. Among some eastern tribes, such as the Central Algonquians, for example, one difficulty might arise which was not of paramount importance in California; it might be hard, working on short notice, to secure cooperative and at the same time reliable informants. This difficulty could however be partly obviated, I believe, by using a technique which always worked well in California, namely, inquiring in advance from the informant with whom one

[47-B]

*648 *657 87 563 in seventh and ninth grades—the beginning grades respectively for junior high and high school—was less than half the figure for first grade in the same year. For tribal children, by contrast, the figures for the advanced grades were each almost twice as large as that for the first grade.

On an average, roughly one-half the small number of Klamath children entering high school could be expected to graduate. [125] That this record was not to be attributed to a difference in intellectual ability is intimated by the results of California mental maturity tests which, as administered to Klamath children as a whole at the fourth grade, yielded normal scores, averaging 96.9. When, however, the same children had reached the eighth grade, their average score had declined to 80.4.[6] A sharp drop in incentive had taken its toll.

The stresses within the school fell unequally upon Klamath boys and girls. Athletic prowess and artistic ability—both often conceived as racially innate and as masculine attributes—gave the boys legitimate avenues to social approval. At puberty, however, Klamath girls were often beginning to develop the physical [142] [562] massiveness that is so frequent in their racial constitution, but that at the same time is foreign to American ideals of beauty. Some bore their lot with dignity and poise. Others courted a fleeting favor through promiscuity or took out their resentments in direct assault upon rivals or upon substitute figures. Direct violence against whites occurred in the schools at about this age, and most frequently involved girls. Still others sought alternatives outside the school, dropping out entirely, going away to vocational schools, or entering into early marriages.

*648 *657 871 563 582 Indeed, for many of the tribal youth—boys as well as girls—confronted by a school experience that grew increasingly irrelevant as they became older, it was merely a matter of "serving time" until they gained release by attaining the age of eighteen. Many Klamath tended to marry young, and there were incentives peculiar to their position. For a girl striving to escape the pressures and dissatisfactions of home life, the regimen of caring for younger siblings, and the boredom and vexation of the school, the importance and security of being a newlywed possessed a [434] [429] fairyland appeal. For the boy, the trust fund accumulated by the Agency for each minor, amounting in some instances to

that seem bizarre. In evading prohibition, as already noted, tribal 648*
members learned successively to operate stills, to patronize and 657*
to serve as bootleggers, and to drink alcoholic extracts. For local 177
roughs, the pug and the cowboy provided glamorous models; 178
and several youths ventured upon the hard trail of the professional 184
boxer. Although cowboy hats and boots were still worn in [883]
the latter days of the reservation, they were giving way among this set to the ducktail haircut and the leather jacket. Drag racing and drinking were pursuits as common among tribal adolescents in Chiloquin as among their peers elsewhere. The intermittent use of marijuana cigarettes and an occasional Pachuco tattoo were evidence of the selective adoption of Inframodal practices.

As a category, the inframodal Klamath were often the immediate descendants of some of the elderly individuals already mentioned, dependent upon them for money once they had squandered their own funds, sometimes residing with them, sometimes "shacking up" in a separate household in a common-law union. They formed but one range of the main body of tribal members, among whom they found associates perhaps as often
as they did among their own sort. They did not habitually asso- [571]
ciate with Inframodal peers among other racial groups, but [573]
characteristically remained in small tribal cliques, of which the [273]
drinking groups were the chief stable expression.[22]

Those tribal members still on the reservation comprised a main body, upon which three lobes might be distinguished: the elders, the Inframodal, and those conformant to American standards. The latter alone had tended to become almost completely cut off from the major body of their fellow tribesmen, save for a few leaders, who had been able to keep the respect of both whites and Klamath. The remainder constituted a single society of strong egalitarian persuasions.

While recognizing that a single criterion must fail as a device 648*
for sorting out categories which are the product of such com- 657*
plexity, a first approximation was attempted in an analysis of the 177
records of a random sample of tribal members in Chiloquin.[23] As 178
sorting criteria, the subjects were first scaled against five some- 184
what overlapping entries involving behavior before the law. Then, 125 •
working symmetrically from the extremes of the scale, they were

*648 divided into three segments as nearly equal in size as possible.[24]
*657 The symmetrical cuts resulted in a Conformant segment, pre-
177 vailingly law-abiding in record, almost twice as large as the In-
178 framodal category at the other end, which consisted of these
184 persons with the highest record of violations. The Intermediate
• 125 membership was slightly larger than that of the Conformant.[25]

The characteristics of each of these categories, when contrasted, tend to confirm statements made previously. Members of the Conformant segment were least Indian biologically and included the highest proportion of women. They seem to have come from comparatively smaller families and, with the Intermediate subjects, seem to have received far more adequate parental care than did the Inframodal category. Educational achievements are less distinctive, reflecting the compulsory nature of schooling on the reservation, but again the Inframodal segment lags behind the others in school grade completed. In the measure of engagement in business or ranching and in record of money management, the distinctions are decisive, with the Conformant category far outstripping its fellows and the Inframodal segment at the bottom. Finally, in both the percentage of those married and living with spouse and family as well as in the stability of residence the same order is seen.

In the second part of the study, the thirty Klamath subjects who had given Dr. Clifton responses to the Murray Thematic Apperception Test (TAT)[26] were assigned by judgment to the three segments, the protocols of each category being treated together by a method of analysis previously employed in examining Klamath mythology.[27] When all of the modern TAT segments were combined and contrasted with the myths, the responses were seen to reflect changes which had in fact taken
place through time. Thus a trend toward a universalistic outlook
[602] was reflected, along with lessened attention to the ramifications
[594] of kinship, a reduction of the family itself to nuclear form, and
[554] a concurrent diversification of role relationships toward individ-
[571] uals acting impersonally as employer, policeman, doctor, or
teacher. A secularization of life may also be reflected by the
scant consideration of religion in the modern protocols.

[571] When the modern TAT segments were compared, the Conformant subjects were seen to place a strong emphasis upon support

given the family by neighbors as well as by the impersonal agents 648*
of society, while making little mention of any kinsmen beyond 657*
the immediate, two-generation family. Members of this category, 177
who objectively were least Indian genetically and who manifested 178
the highest measure of intermarriage with whites, were 184
the only ones to introduce racial comments in their responses. 125
This may well be taken as evidence of their sensitivity to a [571]
marginal condition. In treating intrafamilial roles, they saw a [829]
strong paternal figure (lacking in the protocols of the other two [593]
segments), but they viewed his authority as one against which the son repeatedly rebelled. Moreover, contrary to their own superior record of family stability, members of the Conformant category envisaged the marital bond as frequently threatened by feminine interlopers. Here again is an indication that the Conformant families, like the most acculturated among Vogt's Navaho veterans,[28] had achieved their condition only at the cost of gnawing anxiety.

By contrast, both of the remaining TAT segments tended to [602]
stress kinship, for in their protocols a greater reliance is placed upon grandparents and more remote kinsmen, with correspondingly less dependence upon friends, neighbors, or impersonal agents. Indeed, the Inframodal subjects tended to view the latter with suspicion and outright hostility. In neither segment [593]
was the paternal role seen as prominent; and the mother instead occupied a central position, not disciplining, but strongly supporting her children. Sibling relations, which in the Conformant category had been seen as continuing through life, stood on a lower level among the intermediate subjects, who viewed the bond as existing only in childhood; and were negligible among the Inframodal segment. Similarly, the marital bond appeared to be conceived by Intermediate members as weak, being marked by a succession of casual liaisons, while the Inframodal saw strife between the couple, rather than outside interference, as disrupting the union.

By contrast with Conformant subjects, members of the other
two categories exhibited a far less realistic view of the conditions [829]
making possible achievement, but they did so in different ways. Those of the Intermediate segment seemed to see conformance as a necessary factor for success, although their behavioral record

*648 showed them in fact to be deficient here, and they made complex,
*657 conditional statements about it. They seemed uncertain about
177 the manner in which a prosperous life was to be achieved. The
178 scofflaw members of the Inframodal category, by contrast, saw
184 accomplishment as the result of individual strengths, rather than
• 125 of surrogate support. In this, having regard for their family form,
829 they may be regarded as fairly realistic; but attainment for them often took fantastic forms. One might say that they were content to play with the idea but were unprepared to put it into practice. In their treatment of crime and violence they took a realistic view, as against the Conformant subjects, who also gave it prominence, or the Intermediate category, who seldom discussed it; and they often saw them from the perspective of the violator. Conformant concern with crime and violence, by contrast, was coupled with the view that punishment, often involving remorse as well, was both merited and certain.

*648 Several general comments may be offered. In the first place, the
*657 Conformant subjects stand somewhat apart from members of
177 the other two categories in adherence to standards dominant
178 among whites. A matter of some note is the size of the group.
184 While the size of segments was determined by the purposes of the study, the impression is strong that a larger proportion of tribal members would seem to be attuned already to values honored in American society than have been accepted by their white peers. Social acceptance, from this point of view, has lagged behind the formation of acceptable attitudes.

There are reasons for this. On the one hand, a number of tribal members approve these attitudes as merely reflecting those of the traditional Klamath. Some of them, despite Conformant behavior, decline to choose white associates if it means giving up ties with Klamath kin and friends. Then, too, among whites the formation of acceptable attitudes and behavior must be accompanied by other qualifications, discussed earlier. Major white stereotypes, as can be seen, have been formed about behavior and attitudes found principally among the minority of Klamath who fall into the Inframodal segment, and these have been extended to characterize tribal members as a whole.

Finally, behavior of Inframodal type is more complex than may appear at first. It was present, in somewhat different form, in

Section I. Introduction

This is a report on the personality dynamics of a highly acculturated American 121
Indian population, the Klamath of south-central Oregon. The report consists 125
of blind, idiographic assessments of ten selected cases. The subjects are
male and female Klamath of various age groups who occupy different status positions [101]
and who perform widely divergent social roles in the context of Klamath
reservation culture.

As is the case with similar culture and personality research, one aim of this report is descriptive, that of recording variant attributes of personality, attributes which are not frequently observable in the usual clinical or research
settings of western culture. Thus some mental health and social science personnel 121
may find the report of value because of the unusual character structure of the subjects, but those who serve reservation populations in clinical settings and those who observe for research purposes will find these ten Klamath subjects familiar. In addition to the objective of description we hope that the analysis of these cases will contribute to an understanding of the psychological-- particularly the interpersonal aspects of Klamath reservation life. Beyond these goals, the synthesis of psychological and cultural data drawn from observations of the contemporary scene may throw some additional light on the psychological consequences of acculturation.

The ten case studies in this report were drawn from a sample of fifty four 125
collected in 1958-59 by the Anthropologist during two periods of field research. 114
The original research was aimed at collecting psychological test data so as to [101]
make a contribution to a larger study of Klamath Reservation Culture, which involved both a historical or acculturational study of processes of change and 121
a study of the contemporary reservation community. The larger Klamath study is being supervised by Dr. Theodore Stern, of the Department of Anthropology, University of Oregon. The results of the original personality study have been reported elsewhere (Clifton 1960). This early research effort was predicated upon a loose statistical model, and the aim was to correlate personality types with types of socio-cultural adjustment. It was assumed that the very great range of kinds of behaviors and types of adjustment apparent among the Klamath reservation population could be associated with variations in personality attriburtes as measured by projective tests.

Two distinct variants of this statistical model were attempted and discarded
before a third was developed. The first aim was to collect a random sample
of a target population composed of persons recognized as members of the Klamath [125]
Tribe, who currently maintained a residence on or near the reservation, and who had lived all or most of their lives in that area. One of the two models had this population stratified by criteria which supposedly isolated clusters of types of socio-cultural adjustment. Here the form of thought was essentially historical or evolutionary and was quite similar to the model employed in the
Menomini study (Spindler 1955). The second stratified sample was drawn along [125]
somewhat different lines, and attempted to isolate significant variations in type of family organization (both of orientation and procreation) and patterns of family activity. Because of certain developments in the larger study of Klamath Reservation Culture, and especially because of a very high refusal rate, neither of these formal approaches to sampling could be utilized.

The growing understanding of Klamath Reservation Culture gave cause to suspect the several tentative analyses of the situation upon which these formal models

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it be-
154 came apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to
characterize the confused orientations, the value conflicts, and the disorganized
family life of persons early in their life arc, but the same persons frequently
settled down to a respectable, stable "Elite Acculturated" mode of existence
in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was
considered, but it was apparent that the major cause for refusal was the absence of an existing friendship relation between subjects and field-worker
(or some influential intermediary). Moreover, an analysis of the status of those
who refused indicated that this reaction was neither confined to nor clustered
within any identifiable grouping.

129 For these reasons, attention was given to securing what may be called a deliberately representative sample of the reservation population. The criteria of
representativeness included variations in social roles assumed by the subjects
(occupation, sex, leadership, and so on), variations in role performance, differ-
123 ences in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently,
approached through the recommendations and aid of an intermediary, or, finally,
a direct effort was made to become acquainted with a suitable subject. In all
instances, an existing friend relationship proved the more successful mode of
approach. For reasons to be suggested in the next section, there are few Klamath
persons whose influence is both high and extensive, and, conversely, few who
123 can easily accept external imposition of controls. Thus intermediaries, whatever their manifest status, rarely could elicit the cooperation of more than one
suitable subject. The result of this effort was a set of Rorschach and Thematic
Apperception Test Records, and short life-histories on a sample of fifty four
persons, which sample could for the purposes of the research be considered as
128 reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety
as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there
is another aspect of the field method used in the Klamath study which may be of
123 some interest. In each instance the potential subject was made aware of the in-
tentions of the field worker and the purposes of testing and interviewing. It
181 will be clear from the next section that the contemporary Klamath are in no rele-
vant sense "primitive," nor are they an isolated population. Indeed. many sub-
125 jects were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the
clouds" or figures in rock formations. Further, most Klamath under fifty years
of age are sufficiently experienced in the practices of American culture to
have some personal familiarity with the "test situation," whether personality,
aptitude, vocational, or intelligence. Thus there was a shared basis for this
peculiar form of interaction.

Because it is for several reasons considered important, the fact that each 125
Klamath subject was, in general terms, made aware of the intentions of the 123
examiner and the logic of the test procedure should be emphasized. Recently,
Hauck has described a different approach used for research among the Unitah- 125
Ouray Ute, where he modified the usual Rorschach procedure by concealing the 114
purposes of the test beneath a supposedly innocuous "cover story" (Hauck 1955: 10).

This approach to field testing is subject to criticism on several grounds. In 125
the first place, it is somewhat less than ethical to conceal the purposes of a 123
test so as to facilitate cooperation, and then to publish results in line with
original intentions. Occasionally, this approach has been used in culture and (114)
personality research. It entails the assumption of a kind of mechanical meaningfulness
of any responses to projective tests, however administered, and whatever
the test taking attitude of the subject. At a minimum, the subject has the right
of knowing what he is involved in and the privilege of refusing. Secondly,
where clinical methods of interpretation are to be employed, it is essential
that field research using projective tests as closely as possible approximate
the clinical situation. This assumes that the cooperating research subject is
more apt to reveal important aspects of himself if he clearly understands the
intentions of the examiner. Indeed, one purpose of projective testing is to 12
facilitate communication about difficult topics, not to unduly impede it with
artificial barriers.

Another aspect of this issue is that most American Indian populations include 12
some members with higher education, or, like the Klamath, others with some 177
awareness of the "ink-blot" or the "picture" test via spectatorship in the mass (171)
media. Because of this awareness, any subterfuge or concealment of test objectives
may be publically revealed and further distorted. The consequence of this
can only be a confused or negative appraisal of field research and field researchers.
Given the existing wariness and suspicion of many American Indian
populations and their concern with their status as "Guinea Pigs," such an outcome
is not very desirable. Finally, it is quite conceivable that another field
worker might want to pursue similar research in a situation where the purposes
of a test have been concealed. If so, he will have to support the original lie,
either by accepting it or by expanding upon it.

Quite frequently, the success of field research in the area of culture and 12
personality studies turns upon obtaining an adequate sampling of a population
in a very limited period of time. Perhaps, as is suggested by the extensive
sampling of Hallowell and the Spindlers in repeated field sessions, it is the time
factor which is crucial. In terms of the ethics of research, the validity of
results, the richness of materials collected, the possible consequences of
distorting objectives so as to obtain cooperation, and the implications for
future field work, the alternative approach of using a "cover story" to obtain
quick results is not desirable.

The Klamath personality research grew out of Clifton's participation in a larger 114
study of Klamath reservation culture. The initial, unpublished, evaluation
of the test and life history data was intended to improve understanding of the
psychological consequences of acculturation in the Klamath case and to give
additional depth to other studies of styles of Klamath behavior. This first
approximation, although suggestive, did not prove entirely satisfactory, largely
because of too mechanical a utilization of what are, in the trade, called
"standard interpretative hypotheses." In short, the initial report was too
cookbookish. At the same time the possibility of bias had to be considered,

114 for the field researcher and analyst were one and the same person. It then
[120] seemed potentially fruitful and appropriate to organize a collaborative effort
with an experienced psychologist, and it was at this juncture that David Levine
began participating in the research. The result of that effort is this report,
with its markedly inductive and qualitative approach.

121 Aside from an assessment of the attributes of Klamath personalities, we are,
thus, concerned with several somewhat broader questions. Because of the former,
the Psychologist has set one task as the idiographic analysis of each subject's
Rorschach record, but because of the latter concern this analysis must be considered
doubly idiographic. We are at one and the same time concerned with two
kinds of wholes, each Klamath person, and the total socio-cultural setting. On
the one hand, the Anthropologist's interest lies in the relations between personality
factors and the configurations of Klamath Reservation Culture, and,
thus, in Redfield's terms, in contributing to an understanding of the reservation
[25] as a "unique analysed system" (Redfield 1955). On the other hand, the
Psychologist became interested in this setting because of his concern with using
the Rorschach as one measure of Ego-development, or the level of psychological
maturity. In this respect, and aside from the intrinsic interest of each, the
ten case studies are seen as a possible means of bringing to bear certain portions
of psychoanalytic theory and Werner's genetic psychology theory upon the
task of explaining some aspects of the styles of behavior prevalent in the peculiarly
stifling environments of American Indian reservations. We are, therefore,
interested in developing useful approaches to larger problems and in
building hypotheses.

12 With respect to the division of labor, Clifton collected the original data and
was responsible for writing Sections I and II and the introductions to the case
studies, while Levine gave his attention to the analysis of each case. The concluding
section is a joint effort. Levine's analysis of the Rorschach records
has been without extensive foreknowledge of the characteristics of life on or
the history of the Klamath reservation, and without foreknowledge of the particular
experiences or cultural status of the subjects. The collaboration of
Anthropologist and Psychologist, the inductive, case-study approach, and this
"blind" analysis thus put this report in the culture and personality tradition
most recently represented by Gladwin and Sarason's Truk study. Indeed, this
report was partly prompted by Gladwin and Sarason's recent complaint that
"...studies which would refine and carry forward this or other systematic methods
121 of case analysis have not been forthcoming." (1959: 175). While we agree that
analyses of comparative data should be made available, in all modesty we cannot
lay claim to a refinement of the case study method. Again, we are concerned
with developing useful theoretical ideas, or in finding a place to transplant an
existing idea, rather than with methodology.

122 We are indebted to Zygmunt Piotrowski for his approach to Rorschach analysis and
for suggesting the possibility of our collaborating, to Luther Cressman of the
University of Oregon for providing facilities for publication and for initial
support of the field work, and to Theodore Stern, also from the University of
Oregon, for continuing assistance and encouragement in and out of the field.
[121] Section II of this report draws heavily upon Dr. Stern's published and unpublished
Klamath materials, for which we are particularly grateful. During 1958,
James Clifton's field work was supported by a Social Science Research Council
Fellowship for Training in Social Anthropology, while support for the 1959 research
was provided by the National Institute of Mental Health in the form of a
pre-doctoral fellowship and research grant. The National Institute of Mental
Health has, additionally, financed publication costs of this report.

and the modes of behaving through which the Klamath interact with their behavioral 181
milieu. For this reason it is not to be supposed that White exclusionism 657
or Agency policy alone are the significant antecedents of the stable
pluralism of reservation life. For a Klamath to leave the amorphous atmosphere
of his home or the circle of his drinking pals to enter into the unfamiliar and
unprepared-for activities of White life is a source of fear and anxiety.

Thus, however it may seem to the outsider, the existing way of life on the
Klamath reservation offers substantial predictability to tribal members, a place
to live, a corporate body with which to identify, and multiple stable human
relationships. As a cultural system it may be stable in form although changing
in detail, and therefore this novel set of human relationships is not likely
to quickly disappear. The Klamath today may not be the same persons who were [177]
settled on the reservation a century ago, and aboriginal Klamath, Modoc, and
Paiute cultural attributes may have disappeared, yet they are still self-consciously [171]
Indian. In studies of acculturation, it is frequently argued that groups 181
like the Klamath are marginal, that is, hung suspended between two cultural
worlds. We feel that such a metaphor is both confusing and misleading. It 657
assumes the presence of a reasonably intact cultural alter of aboriginal design 121
and a unilineal path of acculturation process. As indicated above, the former
is not present on the contemporary Klamath reservation. As to the latter, we
argue that the structural consequences of acculturation are many, and a lineal
assimilation process is only one of them. The Klamath situation, we feel, is
that of an unassimilated minority group which is itself very actively engaged in
maintaining its special position and which is subject to multiple external
pressures for maintaining its present boundaries. The Klamath are, therefore,
in a position analogous to religious and racial enclaves. They are a group
distinct from and in some ways opposed to American culture who fit, as it were,
into a special niche in the larger structure of American society. If the term
marginality is to be used with reference to any Klamath individual it can only
refer to his orientation towards conflicting reference groups in the heterogeneous
contemporary community.

Section III. Approach to the Rorschach Protocols

The interpretive approach to the Rorschach protocols was dictated to a large 121
extent by the overall purpose of the investigation. An avowedly inductive 125
and idiographic study requires a broadly clinical, not a narrowly statistical,
analysis of the obtained Rorschach responses. The conclusions reached on the
basis of this kind of research may be considered hypotheses to be tested in
controlled deductive research.

The validity of the Rorschach method for personality exploration is not at issue in the present study; there are obviously more clear-cut and efficient research methods available for that purpose. Rather, the test is being utilized as one means of gaining insights about the adaptive mechanisms of individuals in a particular sub-group that is undergoing an acculturation process — a case-study approach. These insights may lead hopefully to theoretical advances in that area of study called Culture and Personality.

From this statement of the general purpose of the research, several specific 121
methodological decisions follow. It becomes clear immediately that there will
be no comparisons of groups by statistical methods and few statistical tabulations
of group means and standard deviations. There will be no description of
that artificial construct — the modal Klamath personality. On the contrary,

121 the emphasis is on the unique adjustment of the individual subject to the specific life conditions he encounters and helps create.

121 The present approach to the projective tests is, then, radically different from
125 much of the work of Hallowell, Spindler, Kaplan and other writers who at times
have utilized a rigid and mechanical approach to the test data, one which often
114 entailed group comparisons of mean scores. Their methodology makes at least three assumptions. Firstly, that single scores may be interpreted meaningfully out of the context of the rest of the record; secondly, that individual variability is not important enough to obscure group differences; and finally, that the general area under investigation has been thoroughly enough explored to justify hypothetico-deductive research methodologies. These assumptions may be warranted in some instances, but our impression is that too often this rigid methodology has been employed prematurely.

Our use of the projective tests, on the other hand, is similar to Gladwin and Sarason's in that we are unwilling, at this point, to go beyond a case-oriented, inductive methodology. However, important differences between their interpretive procedures and ours are obvious on even the most superficial inspection. While we have attempted to base as much of our interpretation as possible on Piotrowski's explicit principles of interpretation Sarason does not feel that his interpretations would be facilitated by computing a scoring summary. His position rests on the conclusion that the available "evidence" (a term he defines explicitly and rigidly) is insufficient to justify most Rorschach interpretations based on scores. However, Sarason's goals in the Trukese study included an attempt to make explicit the process by which he, as a clinician, transformed the raw data into personality descriptions. Sarason might have come closer to achieving this particular goal had he paid more _explicit_ attention to the scoring categories. In his analyses he used extensively the initial reaction times, the number of responses, and the level of form accuracy of the responses. However, he was also acutely and continuously aware of the manner in which the subject dealt with the colored and shading aspects of the blots, as well as the extent to which movement was involved. Although we agree with Sarason that the validity of much of the interpretation based on Rorschach scores has not been demonstrated scientifically, we take the position that explicit utilization of Rorschach scores and specific interpretive principles will enable us to approach more quickly the goal of understanding the process by which the clinician goes from the raw data to the personality interpretation. In addition, there has been a considerable amount of scientific research — much of it done by Sarason and his students — which suggests that some Rorschach scores do have behavioral concomitants. Our hope is that by being explicit we can move ever closer to the goal of determining the validity of the Rorschach, while at the same time using the test for whatever inductive value it does have.

121 Since the focus of this study is on the subject's adaptive mechanisms, the Ror-
125 schach interpretations have been carried out in a theoretical framework which emphasizes Ego Psychology, rather than the exploration of specific instinctual energies. Scientific research and clinical opinion both indicate that this approach — emphasizing ego functions, not the probing of unconscious depths — is likely to be of greater ultimate value and rests on a surer foundation. (Klopfer, 1954; Sarason, 1954; Schafer, 1954, to mention but a few). Thus, we are less concerned with _what_ the subject sees in the blot than in _how_ he sees it.

114 Piotrowski's principles of interpretation (1957), as well as his interpretive "definitions," are in accord with this orientation and generally were followed.

Piotrowski's stress on analyzing the percept, rather than the verbalized response (hence, perceptanalysis) is an example of his emphasis on a careful scrutiny of the manner in which the subject is approaching the task presented by the Rorschach examination. The errors resulting from a too hasty reliance on the subject's verbal report range from assuming the response "bat" to Card I is a W, when it might have been a rare detail to scoring an F- for any statistically infrequent response when a careful inquiry might have revealed an accurate, original, and well-organized percept. Ultimately, of course, we are dependent on the subject to tell us what he sees and how he is seeing it, but a sensitive, careful inquiry can help the subject communicate in words the images he has created. When our goal is an understanding of the adjustment of an individual Klamath, this attempt to see the blot as the subject sees it enables us to approach — with empathy, if you will — the subject's own manner of perceiving the blot stimulus. 121 125 114

However, Piotrowski's method of interpretation rests on firmer footing than this perhaps vague statement that an attempt is made to empathize with the subject. Piotrowski has stated, in explicit principles and definitions, the interpretive significance which he attaches to the various kinds of responses. Although these principles were used as guidelines, they were not adhered to in a dogmatic fashion.

For example, the Rorschachs were scored carefully, but not rigidly. An illustration of this distinction is the scoring of form level. Much has been written about this pseudo-problem; the Beck-Klopfer controversy concerning a statistical versus an evaluative basis for form-level scoring has generated much heat. The present approach may seem at first blush to beg the question, but a moment's analysis indicates that the scoring is always done keeping in mind that the ultimate purpose of the test is interpretation. Thus, if a response is clearly an F+ response, i.e., the form of the image corresponds without question to the blot area, there is no scoring difficulty. However, if the subject gives a response which is neither clearly F+ nor F- (and for Beck, is statistically infrequent), but rather gives a response which might almost be justified, but not quite, the scorer need not sit in a quandary; to my way of thinking he need indicate merely that the subject has produced a response with this kind of borderline form level. (More detailed analyses of various approaches to form level have been described by Phillips & Smith, 1954; Klopfer, 1954). If the subject produces this kind of response often, we conclude that he often responds to life in a manner which does not include a careful evaluation of the situation, but that he does not behave in an obviously idiosyncratic manner. More precise interpretations may be formulated in the specific instance, of course. Piotrowski's scoring F± for vague responses such as "clouds," "rocks," or "bays," is an example of his attempt to formalize this approach to scoring borderline responses. 125 128

As a corollary to the emphasis on Ego interpretations, an attempt was made to evaluate the adequacy of the subjects' adjustment, and in the attempt, to uncover the person's strengths and assets, as well as his flaws and weaknesses. The task consisted, in part, of gauging the extent to which his particular adaptive mechanisms enable him to cope adequately with his impulses and feelings in the context of his environment — to what extent his life style meshed satisfactorily with his life space. Since the Rorschachs were interpreted by the psychologist initially without information concerning the subject's life history, this entailed a careful examination of the balance of components in the protocols themselves. In this process much emphasis was placed on the organizational quality of the responses. The research on genetic-level scoring of the Rorschach 121 125 [128]

121 (Levine, 1960) has indicated that this may be an extremely important measure
125 of ego strength. Whether this is supported in cross-cultural work remains to
[114] be determined.

121 The emphasis throughout this phase of the research has been on the functioning
15 individual — how he adapts to his environment in general and, whenever possible, how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and
so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application
is often very helpful and may have led to the most important conclusion of the
156 present investigation: that the Klamath are characterized by a guarded and
[171] restrained approach to life and interpersonal relations. This guarded restraint
is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

*159
156 Slim is a restrained, dignified person who is very accepting of his status as an Indian, but who does not make too much of it. For example, he dislikes the annual Indian get-togethers because of the gaudy commercialism. A person who admires a strong, consistent leader, Slim deliberately avoids unreliable and erratic persons, for which reason he does not much participate in the reservation drinking cliques. He is one of the most assertive and sociable Klamath known to the writer. In his interactions he maintains his dignified, independent stance, yet reacts freely and responsively to others. He gives little overt indication of hesitancy or inhibition, and if anything is perhaps mildly boastful and pretentious. If a phrase will describe his outstanding characteristics, it is a well-fed, complacent hedonism. There is one thing which his white friends have against him, and that is because he is well respected and liked they are displeased because they cannot draw him into more community activities, which invitations he rejects with the disclaimer that "I'm too itchy footed to join that, I may want to leave for Washington next week."

Rorschach Record

(9) D Fc ntr	This right here LL a reflection in the water—a tower at the end of a little pond. You can see a reflection. Trees on both sides of it. These are pretty interesting.

(6) Grey area w/out bot. center, D14. There's the head here. Here'd be the hair. A big forehead, hooked nose, no chin. () I guess they're dancing—jitterbugging I guess you'd call it. () Yes, when I first saw it it looked that way. (7) Side red, D21. () I've seen pictures in the home doctor book. (Comp. w/ Loc. Ch.) No, it looks the same. (8) Center red, D20. Like in my drawing I'd make a line and show infinity...the point disappearing...get a perspective. () Right here'd be the vanishing point...straight lines run down to it. () The shading would help...like the sun is fairly low...the ends were a little light...the light is coming from the side. The sun is very low so both sides are shaded. The color was important, not the red, just the shading. (9) All bot. center, D18. () Well once in a while in the Nat. Geo. Mag. you see a picture of a tower or a castle and a pond with a mirror reflection. (Tower= top vertical dark, reflected trees= lighter grey tendrils below, trees= darker masses on side.)

IV

(10) D FMcc' ad 40"	(Much initial rotation of this card) LL...ah...a dog standing there looking straight at you...marked something like a German shepherd.
(11) Dr FMc' a	A crude outline of a bat. I have one question. Are all these (cards) the same kind of reproductions? () (S. studies printing on back.)

(10) Bottom center D23. () It was the shading...marked like a German shepherd...dark on the forehead...black on the edge of nose. (11) Bottom two thirds of blot. () He's just starting to land...y'know how they flop their wings. () The black or dark suggested it, and the outline struck me too.

V

(12) W FM a P 5"	It LL a butterfly. (Much rotation of card) All I can see in it—wait
(13) d Fc' ad	It LL a little monkey, with a black face, the top of his head, got a grey neck and his chest...grey down to his shoulders and chest. All I see here.

(12) Whole. () LL he's flying...just the form or outline. (13) "Devil's head" at top of wing. () The light part in there LL his cape, I guess you'd call it.

VI

(14) D Fc± ad 45"	Ah...let's see...LL a big plateau like you're looking at it in an aerial photo...a long plateau with a straight canyon down the middle of it with a little peak at one end. (Rotates) That's about the size of it here, too.
(Add 25) Dr Fc± ad	Animal skin

(14) Bottom detail, D41. (Add 25) It LL the outline of the skin of an animal tacked to the wall () The outside of the hide () LL the fur right here. Add 25 is bottom D, less lower 1/4th.

VII

*159 •125 Rejection				85"	(Very much rotation) (Laughs) I can't make anth. out of this one. (On inquiry S. reexamined card carefully w/no success.)

VIII

(15)	W	FMc	a,ntr	P 13"	This LL a bob-tailed cat standing on two rocks. His reflection there...he's watching something in the water. Got his ears laid back...one of those fuzzy, long eared cats. (Rotates) All I see here.

(15) Whole-card to right. () Like a mirror reflection. Bobtail, head ears. (Ears back?) Some cats will lay ears back when watching something. Like an Angora cat—kinda fluffy, a shaggy outline. () The fluffiness comes from both the jagged outline and the shading. (Comp. w/ Loc. Ch.) Looks the same, except that would be a pencil drawing and this a color drawing. I could make a real good picture out of that (What watching?) I've no idea...just watching.

IX

(16)	D	Fc	hd	14"	An old grey haired man with dark bushy eyebrows, a handle bar moustache, and a receding chin. (Rotates card)
(17)	D	FM	ad		Kind of a head of an animal. Guess you'd call it that, a long snout, nose slanted, a long forehead—bony forehead, dark beady eyes and a very prominent Adam's Apple (S. is almost overcome with laughter)

(16) Headlike part of pink, D65. Card to right. The dark bushy eyebrows are the darker part here. (Grey hair?) The face is fairly dark and got light hair, light colored hair, could have been a blonde, too. (17) Deer-head-like brown grey at top of green, D63. Card to right. This is what I laughed at. (Re-describes and again breaks out in laughter) I kept seeing that little beady eye and then I made the outline out. () Oh, just sitting there, laying there...got his neck stretched out.

X

(18)	D	CcF	ad	10"	This is a pretty one here. Tail feathers of a bird of Paradise. A paradise bird green!
(19)	D	FM	a,art		Two lions like you see on a crest: facing each other.
(20)	D	F±	a		One of them animals: a creature you see in a science-fiction story.
(21)	D	FMc	a		A furry, husky dog, with no tail.
(22)	d	Fc±	ntr		And here's another pool with a reflection. Trees along a bank, and the reflection in the water.
(23)	d	F	hd		Another one of them faces...large prom. forehead, sunken eyes, pug nose, lantern jaw, fat lip. That's about it for me.
(Add 26)	D	FM	a		A bug ready to fight.

(18) Bottom green. Half of D74. () The green and the different shades of green. (19) Middle yellow, D71. It was just the outline of that. Like lions on a crest. With an exaggerated pose, the nose up, the legs stretched out behind, (gestures) and the chest out. (20) Side blue, D76. Card to right. () A big blob of a body, and an outgrowth from the cheek bones. The darker part, here is the head. (21) Corner brown-orange. Card to right. () He's jumping. Got his forelegs extended in front of him. () The shading helped. Gave me the impression of round. (Comp. w/ Loc. Ch.) It looks the same. (22) Top grey-brown, D67, less top "feelers." () Disregard these little parts here. (Comp. w/ Loc. Ch.) It looks the same.

X Continued

159*
125

(23) Darker inboard portion of top of large red Ds. () It was just the outline here at the top. (Add 26) Both animal-like parts of top grey. I wouldn't know what to call this. It LL some kind of an animal or bug ready to fight...here's the antennae, the eyes, and the mouths, both are open. Wouldn't know what to call them.

(1) low W
(2) high Sum/c
(3) high d

Rorschach Interpretation

159*
157

The few W, the emphasis on shading, and the large number of d highlight this man's approach to life. He is concerned about minute details and subtle nuances, but relatively neglectful of general considerations or extensive plans for the future. This is both his strength and his weakness. He talks about his "drawing" and comments "I could make a good drawing out of that," but he does not have the motivation, ambition, perseverance, or overall organization which a successful artistic creation requires. He may act the part of an artist, but it is doubtful if he is actually very productive or creative.

On the other hand, this attention to detail enables him to react sensitively and probably with tact in interpersonal relations. He is careful and likely to be concerned with the feelings of others. He rarely acts inappropriately or inconsiderately and, with his above average intelligence, may be relatively successful in life.

The low W and the Sum/c greater than Sum/C would, in a white American, suggest the pattern of the "alpha schizophrenic." Piotrowski's concept of the "alpha schizophrenic" is based on the hypothesis that some people do not manifest overt

(152)

their resolution. Just as clearly, she is extremely discouraged and demoralized. During the course of testing and questioning she was manifestly anxious from time to time, this being evident from a slight stammer, frequent parapraxes, and a tendency to over correct for errors. To the blank TAT card, #16, she told a story of a girl's reaction to the death of her mother and then cried painfully, trying to control herself.

Rorschach Interpretation

159*
157

This is a rich and complex Rorschach protocol and reflects a subtle adjustment to life. Not only does the subject give 6 good quality M, 9 well organized W, Sum/C = 2.5 and Sum/c = 2, but many of her responses are highly integrated and she often utilizes blends of determinants. She has more M than FM and more FC than CF. Thus the test indicates that she is an intelligent, sensitive person who is making an active and appropriate adjustment to life.

She gives an adequate number of responses and, although her approach emphasizes W, her W attempts are usually successful. The occasional slip in organization

extensive plans for the future (e.g., opening a second-hand store and capitalizing on the poor buying habits of the "Indians.") none of which have much chance for materializing, but many displaying a fairly shrewd assessment of the local community. He can get quite enamoured with making these plans, and savors the profits in his current fantasy. 159* 154

Sparrow was tested while in jail, this being the only likely time when he would be sober enough to see the blots clearly. 159* 124

Rorschach Interpretation

In reading this Rorschach protocol, one gets the impression of a gregarious, effervescent, kindly, but ineffectual elderly man. He lives in the past and the future, but not in the present. He probably is unable to deal with the mundane issues of his present reality situation so he concentrates on his past experiences or his future plans. This characteristic trait is reflected in the de-emphasis of D responses and his over-emphasis on vague and undifferentiated whole responses. 159* 157 [154]

His emotional effervescence is reflected in the low F% (20%) and high Sum/C (6). His responses to the test tend to be largely of an emotional nature: shading, color, movement; they are not based on a cold intellectual, rational analysis of the blots. And so his life adjustment would be of this nature, i.e., determined largely by his feelings at any one moment.

One must consider seriously the possibility that this lack of intellectual control bespeaks of a serious psychological disorder --whether it be of an organic or functional nature. Is his response to Card IX a contamination, for example, "it's the shape of Australia and the green suggests grass. It's the color of an island." What is meant by the "color" of an island? To what extent have 157 125

157 125 the characteristics of the blot been organized intellectually and to what extent is he unable to accomplish this analysis? If he cannot accomplish this, there is a disorder of thinking present. Also, his response to Card II: the whole looks like an island, and the red looks like fire, therefore it looks like "fire on an island." At best it is a fabulized combination; at worst it is a contamination. Only a blatant schizophrenic would have gone to the pathological extreme and said "Fire Island." In addition there are no movement responses, there are only three popular responses and the F plus percent is only 56. Where are the control factors? The sum of color responses is 6; the sum of dark shading responses is 5; and there are not the indications of sufficient controls for this amount of emotional energy.

157 153 On the other hand, there are a few responses which suggest that his intellectual ability has been greater than average. His knowledge of the word "obsidian," for example, bespeaks this ability,[1] as does the nature, although perhaps not the feasibility, of his "plans." This is not inconsistent with the statements made previously, but it does suggest a situation marked by increasingly greater interference with intellectual functioning.

157 159 The absence of any human responses in his Rorschach suggests his lack of concern with genuine interpersonal relationships; all his talk of future plans and business suggests that he is interested in using people for his own gain rather than in having meaningful and warm interpersonal relationships. His reaction times are quick, supporting the notion that he is likely to act in an impulsive manner. Two of his FM (R2, R7) are "flying," reflecting perhaps his tendency to try to escape from the present situation in an unrealistic manner. His other FM response (R1) may be an indication of his view of human relations: aggressive, cold-blooded, eat or be eaten.

[158] In summary, then, the test reflects an elderly man, whose intellectual and emotional control appear inadequate. One wonders about the possibility of this man having been a chronic alcoholic and now suffering the effects of diffuse organic brain damage. He "talks big" but he probably doesn't "deliver the goods." There are indications that at one time in his life he may have had better than average intellectual ability and now is going downhill.

---

[114] [823] [1] This is, perhaps, the one place in these ten cases where a lack of knowledge concerning Klamath culture led the analyst astray. The Klamath are astride the western volcanic belt and one of the most frequent kinds of materials used in their tool manufacture was obsidian. Hence Sparrow's use of the word reflects his interest in and awareness of an important local raw material.

*159
156 and anxiety associated with her responsibility in a double murder. She had
given a rifle as a present to a lover, and following a drinking party at her
house he had killed his brother and a stranger with it. Her thinking was extremely morbid. She expresses the wish that the more violent of her previous
husbands would return and kill her.

*159 In the testing and interview sessions Nell's behavior quite definitely was not
representative of her ordinary interactions, and once she felt somewhat relieved
157 she immediately got more distant, withdrawn, and unapproachable. During testing
[124] she exhibited a high level of manifest anxiety and an erratic pattern of interaction. She was alternately over-talkative and quick to reply or to initiate
[152] a sequence, and then silent and down-cast. Her concern was real, for it was
known that she was under suspicion for complicity in the murder, but this was
not the root of her anxiety. What the connection was cannot be evaluated from
available evidence, but it may be that her conflicts were related to the trouble
her lover had gotten into, for it was his situation she wanted most to talk
[156] about. Normally she is relatively inflexible in her relationships and preserves
her withdrawn and isolated position at all costs. Her behavior then exhibits
a high level of drive, but is poorly organized, confused as to goals, and produces repeated overt conflict with lovers, husbands, her parents, her children,
work associates, other community members, and law enforcement agents. Still,
she expresses the need to be cared for and dominated consciously, as well as the
156 feeling that she was being persecuted and rejected. She feels herself to be an
entirely worthless person, and this evaluation is shared by the community at large.

Rorschach Record

•125 Note: With little variation between cards, each was approached by the S. in
*159 the following manner: She would take the card, repeatedly twist it and turn
it, swiftly cover portions of the blot with her hand or fingers, hold it at
arms length, hold it closer and examine it carefully, lay it down momentarily
and stare off "thinking," and then after a silent delay of an average 145" spit
out a series of responses rapidly, as if they were hot peas.

No. of Resp.	Score			Time	Response

their brooms. They have something blowing out behind them...flying through the air. Might have been the color cause it's grey. (2: top third of blot) It just reminds me of wings. (3: top center "hands," D4) They remind me of hands reaching up...out of nothing, I guess...just reaching up. () Yes, human, just like they're reaching for something. (4: D4 and center "heads") Like deer horns, too, because of the two points on each side. Mostly because I like deer. I'll go riding in the evening just to see deer—not to hunt—just to see them. (5: usual "legs," but extending up to "bust" at center grey spot) Like I used to draw, hands on hips. It's not a drawing, it reminds me of a woman standing there. (6: tiny spots off bottom edge of main blot, card down) Must be musical notes. They must just resemble notes. (No movement implied here) Like in a comic book. (7: left half, card to right) It looks like an animal with wings. Did you ever see an animal with wings? Like a four legged animal looking down.

125•
159*

II

(8)	W	M	h	181"	It doesn't remind me of much except two old ladies sitting together gossiping. That's all.

(8: W) Guess this would be their feet or knees. The red things would be their heads. (Old ladies?) I guess this would be their nose and their chin...they're long and pointed (points to top red).

III

(9)	W	MCc'	h,fire P	123"	When I first looked at it, it looked like cannibals looking over a pot with a fire in the background.
(10)	DrS	F	ntr		When I look at it another way it looks like landscapes, well, like in China.
(11)	D	CF	blood		Then, it reminds me of blood.
(12)	D	F	ad		These things here, if you take them alone, they remind me of horses legs.

(9: W) Fire, because these spots are red and cannibals because they're black and have long necks. (10: bottom half of blot, below "bow tie," card down) These would be the trees. Kind of a pathway going up (White center S, below "bow tie") (Why China?) I don't know, seems to me I've seen...I had a pair of drapes that was Chinese and they had two trees like this. (11: top red details, D21) Probably because they're red and look like blood spots. (12: bottom leg-like extension, D17) They're long and narrow on one side...must be the shape... probably this reminds me of a hoof.

IV

(During interval between cards, S. stated: On these cards I usually give you my first impression on looking at them...then I try and go back and find something else...but I give you my first impression.)

(13)	W	c'	ntr	190"	Well, it reminds me of a swamp. I've never seen a swamp; but it's like pictures I've seen.
(14)	D	Fc±	ad		This part in here just reminds me of the skin of some animal stretched out, and that's about all.

(13: W, card to right) Well, like the bottom part would be a reflection of the top. (Swamp?) I dunno, just the...course it's dark and you can't see anything... probably because of the shadows. (14: bottom center, D23, card down) (Inside or outside?) The outside, you know, when they trap animals and stretch the skin to dry. It would be the outside. (Furry?) Uh, huh.

V

•125
*159 (15) Dr M h 230" I dunno...it just reminds me of two girls sleeping... laying...resting.
(16) W FM a But at first it looked like a big vulture or something. That's about all.

(15: top half of left and right "wings") (Girls?) Well, this looks like a girl's leg for one thing, and then it looks like she's got curly hair. (16: W, whole card) These are the wings...like it's flying.

VI

(17) W c,F- ntr,h 145" When I look at it like this, it looks like those pictures they show of duck hunters when they go out hunting early in the morning...when there's clouds and fog.
(18) D c cg Now this just reminds me of a fur coat...just one of those great big fur coats they used to wear a long time ago.
(19) D Fc indian also makes me think of a totem pole.

(17: W, Card to right) Just a scene. This would be the fog. There's always tules or grass. Of course, there's no duck there. No hunter, either. (18: bottom detail, D41, card down) (What suggested?) Well, it just looks furry to me. (19: top detail, D39) Well, because it's straight and tall and it's got different colorings in it—and these things come out the sides.

VII

(20) W cc'm clouds 110" This looks like...reminds me of a house and lightning or something trying to strike it...and these look like clouds or smoke.

(20: W) Well, because it's dark clouds, you know, storm clouds. Like it's getting ready to rain and storm. (House is tiny light grey area at extreme bottom center of blot; the lightning is the light streak in the bottom center)

VIII

(21) W CcF fd 72" It reminds me of Ice Cream—No—that's just what
(22) D FM a P it looks like. It really looks like some kind of
Dr CF ntr a cougar or cat walking over rocks.

(21: W) The texture in it looks like ice cream...it's the color. (22: left ½ of card, card to right) This would be the different rocks and he's stepping real lightly from one rock to the other. (Why lightly?) I guess because they're separated. (Why rocks?) Because, well rocks are so many different colors.

IX

(23) D M h 150" I'm back to witches again...all I can see is witches and monsters.

(23: orange, green and violet details, card slanted to right) That'd be two witches (the orange). (What are witches like?) Well, to me they seem old and mean and here they kinda look like they're backing away from something. Now when I turn it over (to the right) it looks like this one (violet detail) is just standing by looking and this one (green detail) is pushing the witch over. I think I've beem reading too many funny-books.

X

(24) D F a 95" These blue ones remind me of octopuses.
(25) W CF rec When I first looked at the whole thing it reminded me of something gay, like a carnival, when everybody's having a lot of fun.

X Continued

(26) D M h These grey ones remind me of two men plotting something. That's it. 125• 159*

(24: side blue, D76) Both of them. () Dunno, because of all the lines going out. (25: W) That would be just the colors. (26: all of top grey, D67) Now they're not even shaped like men, but it's just like they were men. (What are they plotting?) I don't know. (Up to no good?) Uh-huh!

Rorschach Interpretation

Of this young woman's 27 responses to the blots only six are based completely on the shape of the blot. The balance of determinants, however, suggests that she probably has sufficient control over this emotional lability to effect an adequate adjustment (M:Sum/C = 8:4.5; Sum/c:Sum/C = 5:4.5). An extensive fantasy life and caution, motivated by fear, enable her to respond in an appropriate and realistic manner much of the time. However, in five of her nine whole responses she pays little or no attention to the shape of the blot (R13, R17, R20, R21, R25). These constitute vague, diffuse responses and indicate that much of her behavior is of this nature: diffuse, over-emotional, poorly controlled, primitive. If she is able to control her affectivity then, it is not the result of an easy, automatic control; it is, rather, control based on fear and inhibition. 157 159* [125]

Her long delay before responding stands out as a characteristic feature of her record. Her initial reaction time is probably the longest of the sample and is [125]

[157] [159] [125] very extreme when compared with white American Rorschach protocols. What is the meaning of this delay? What psychological processes are going on in the interim? Her subsequent rapid delivery of varied and generally appropriate responses suggests that she is, in fact, concentrating on the task at hand and arriving at feasible solutions to the task which the examiner presented to her ("What does this look like to you?"). However, the question remains: why doesn't she talk during this process?

[152] One thing we know: she isn't apathetic or disinterested. On the contrary, underlying her delay, there is considerable feeling. Not only does she give four CF responses, but she gives diffuse responses to the blackness and shading elements of the cards. Her first responses to Cards IV, VI, VII, and VIII are vague, whole responses with little, if any, form element involved. Her delay and control do not allow her to succeed in integrating her feelings and impulses with the objective demands of the situation. In R17, for example, we are able to see the manner in which her mental processes may, on occasion, totally ignore the environmental requirements for appropriate behavior. Her response here is "pictures of duck hunters." On inquiry we learn, however, that there are no ducks and no hunters — only fog. Her perception, then, was of a vague, foggy, diffuse world; she enlivened it and peopled it in an elaborate manner through her own rich imagination. To what extent will she allow this rich imagination to overwhelm the demands of the external world? Her Rorschach responses indicate that this will occur often in a sporadic fashion, but that she will be able to recover from these periods and correctly evaluate the situation once again.

This over-ideation, — especially in the light of R26, "men plotting something" — suggests a distinct paranoid trend. She is suspicious of the motives of others and fearful of what the future has in store for her. Even natural forces are considered powerfully threatening; R20, for example, indicates that lightning is "trying to strike" the house.

An analysis of the roles reflected in the human movement responses suggest that this woman has managed to adopt a wide variety of role patterns. She has human movement responses which are verbally aggressive (R26), grasping (R3), guarded (R9), totally immobile (R15), as well as complex (R23). It is this rich, imaginative fantasy life which enables her to delay responding to the blots for such a long time. The reason she must delay is that she does not trust the environment and the people in it.

Some of her movement responses demand more careful analysis. Three of the eight M are old ladies or witches; witches "are old and mean," she tells us. Since her very first response to the test is also a "witch," it would be remiss not to try to determine the personal significance of this response. We are probably on reasonably safe ground assuming that it reflects her attitudes toward older women and therefore some kind of mother figure. Her mother could not have been very nurturing or warm, nor is she likely to see herself as a particularly nurturing person; she does not feel comfortable giving emotionally to others. On the other hand, R3 suggests that she is not content to "do without." If rewards
[158] do not come easily, she is ready to "reach out" for it. At the same time, however, we must note the content of R15: "two girls sleeping...resting...laying." Piotrowski has warned of the pathological significance of this kind of immobile human movement response, suggesting as it does, a willingness to submit to the external forces without a struggle.

Her animal movement responses are also suggestive of a suspicious and hostile role pattern; of the three FM, the first (R7) is "an animal looking over

156

with his concern with losing the support of his constituents and his feeling that he was not really "in" with or a member of the White group. In many ways Carrie dreads the future, feeling that he has over-extended himself. Thus, as well as being the source of satisfaction, social esteem, and profit, Carrie's achievements are a continuing source of anxiety. He suffers the pangs of success.

Rorschach Record

125•
159*

No. of Resp.	Score				Time	Response
						I
(1)	D	F	a		45"	Oh, I see (rotates card) it looks like two different things to me. The one way it looks like a bug.
(2)	W	F	at			And this way it looks like the bottom vertebrate of an animal of some kind.

(1) (Entire center area, D1) That could be his legs. Some kind of a bug or a beetle. A water beetle maybe. () It was the form mostly. (2) (Down, center blot) () It was the form mostly--the shape.

						II
(3)	D	FM	a	P	43"	It has to look like something? Well this way it looks like two dogs that got their noses together...or sheep...or some animal.

(3) (Entire dark area, D8) See here...the darker ones...or even a bear...a couple of cub bears. It looks like they got their faces together. There it would be the form or shape...what's the difference between form and shape?...Just the darker ones. I couldn't distinguish anything with these red blots.

						III
(4)	W	M	h	P	50"	This looks like two people trying to lift something...lift something up off the ground.
(5)	D	FM	a			And two little objects falling. Looks like two birds falling to the ground.
(6)	D	FMC	a			This object in the middle looks something like a butterfly...a red butterfly.
(Add 22)	D	F	at			A skull

(4) (Black area, D13) They're pulling hard on this...either pulling together or against each other. (men or women?) Might be women because they got a big chest on them (chuckles). (5) (side red details, D21) They're probably shot the way they're falling. (6) (center red, D20) I couldn't think of anything there but a butterfly. (What kind of BF?) Well, it looks like it's in flight. (Add 22) (Bottom center, D18) That object that they're pulling on does look like a skull of some kind.

						IV
(7)	Dr	F	a		75"	(Several rotations) This thing reminds me of a bat...but it doesn't look like a bat.
(8)	Dr	Fc'-	a			The dark outline's got a face...it looks like a wild boar to me.

(7) (down, darkest parts of entire blot, indistinctly outlined) Not the whole thing just the darker part looks like a bat to me. (8) You can see the dark outline here. These are the tusks...and you can see the eyes. (down, same area. Both exclude D27 and D23).

V

•125
*159

(9) Dr FMc' a P 71" (several rotations) This looks like some kind of a butterfly. (more rotation)

(10) Dr FM a Could be two mountain goats making a sharp contact. Rams, when they fight. It don't look that way, but it could be.

---

(9) (Whole blot less lighter side extension, D34) It was the darker shades I guess...except for these (D34)...a butterfly in flight, or it could be lit, too. Some of them light with their wings out. (10) (Whole blot less bottom extensions, inverted) These are his feet out here and these are the horns...it don't really look that way.

VI

(11) W F hide 62" This looks like something's hide that might have been hanging on a fence...they took it down and laid it down...hide of a fox or wild cat...spread it out on the ground after it's been hanging on the wire to dry.

---

(11) (Whole blot) It's laying down and been opened up. It's been hanging on a wire—see this is the middle line. Fox-wildcat—been taken down and put on the ground, the hair toward the ground. This is the inside. () Well the only way I can say what makes it look like the inside is this dividing line...that was against the wire.

VII

(12) W M h P 105" (several rotations) This could be...looks like...reminds me of a woman in the gay nineties looking at herself in a glass. A big hat on her head.

(13) D FM a I dunno...it ain't a dog...but a sheep or something. Two of them looking at each other.

---

(12) (down, whole blot) The entire body. Here's her arms, legs, feet. Here's her face. Here's her hat. (Anything else suggest that?) This is her body. Here is her hind end. Her body is facing this way but she's got her head turned looking back. Got a gay nineties figure. Big breast, small waist, and a big butt...don't quote me on that. (13) (top two thirds) Well, it's part of the body. Here's the nose, feet. The ears are pretty big. I don't know if it would have that big-a-ears. Some kind of animal. (why sheep?) I dunno, because of the color I guess and it looks like hoofs of some kind.

VIII

(14) W FMCFc a,ntr 33" P This looks like some kind of animal...grey squirrel...No, a ground squirrel or a ground hog...walking...standing on a bunch of rocks. He's crossing over a creek. He doesn't see his reflection but his reflection is there if somebody is to see that.

(15) D F at This could be a skeleton of some kind of dead animal. I dunno...a cow, maybe. A skeleton head of some dead animal.

---

(14) (side pink, D57 is animal; concept includes whole blot) He's not looking at himself; but his reflection is there. (why rocks?) Well one thing the color...a squirrel isn't this color. It's the foundation of the rocks. (what mean?) Well this is the form of a rock—the shading and colorings. (15) (bottom pink, D55 down) You've seen a dead cow's head...all in red and pink...the horns and knobs on the head. That would be portions of the skull. (recently dead?) No...(still meat on it?) No...no meat...just the skull. A bleached skull picked

VIII Continued

125
159*

clean by the buzzards. (why bleached skull?) Just the shape I guess. (color at all?) No--well the color too. But I've never seen a skull that way--mostly they have been bleached.

IX

(16)	D	F	ad	64"	A portion of this reminds me of a head of a rhinocerous.
(17)	Dr	CF	at		It don't look like it; but when you gut a deer and lay him out, spread him out...well it reminds me of the inside of a deer or a gutted beef.

(16) (down, green detail, D62) See this is his horn and his mouth. There it's the form and the shape. (17) (center grey-white, D59; center line, D58, adjacent shading, and bottom pink, D64) The bottom part of it mostly...now you've sawed the vertebra in two and drawn his guts...could be a beef too. The bottom looks red, meat red.

X

(18)	W	F Cden	a	35"	This reminds me of marine life...
(19)	Dr	F	a		of a crab or spider underwater...this is all underwater.
(20)	D	F	a		This here looks like a seahorse.
(21)	D	F	a		This might be a prawn or a crawfish...No, a prawn.
(Add 23)	D	F	a		a water bug

(19) (right side blue, D76) A crab with his pinchers. (20) (right, side brown, D77) A sea horse or some kind of a bug...just the dark part of it. It was the shape...could be some kind of a bug too, not a sea horse, a water bug (23-add) (21) (right, bottom dark green, D74) The shape of it...see here, his eye. Course he's pretty long. Just the back shape of it. I don't know how long prawns really are. (18) (whole blot) Marine life because of the form and the shape of it; not because of the colors too much. (Compare location chart) No, it wasn't the colors so much, just the shape of the marine animals, and the rest of it could be the formations in the water.

Total Time: Not available due to numerous untimed interruptions.

Rorschach Interpretation

157 The Rorschach test reflects a person who has managed a satisfactory adjustment
*159 largely through the inhibition of whatever originality and creativity he might
have possessed. The extremely high a%, the limited range of content, the six
•[125] populars and the absence of any original responses point to the stereotyped conventionality of this man's psychological process. This apparent dullness is not due, however, to a lack of capacity. His vocabulary, the presence of movement responses, and the occasional well organized whole response indicate that he has the potential to do more with his life than he now settles for.

The effects of this marked inhibition are numerous. Firstly, the extremely long initial reaction times, averaging close to a minute, are indicative of the blocking and caution which marks the record as a whole. Secondly, the color denial in R18 point to the hesitancy with which he approaches emotional situations. Thirdly, the nature of the human movement responses reflect internal conflict, tension, and blocking. The first M in the record (R4) highlights this man's feeling that he is hampered when he tries to express himself. He is not sure whether people can work together or whether efforts at cooperation end in conflict. But even if they work together, people must work extremely hard and are not likely to accomplish very much. This is not to say that this man has not accomplished much in actuality; on the contrary, he probably does work hard and
[155] may have substantial achievements to his credit. But, psychologically, he is blocked and wastes much energy in this internal struggle.

The other human movement response (R12) is also not an assertive one; although it is not as blocked as R4, it is a restrained response — probably best classified as "guarded restraint." It does not contradict the interpretation made on the basis of R4. It adds several interesting facets, however. First is the exhibitionistic element; this man needs to be admired. Secondly, both his M's are female — attention is given to the breast in one and to the "big butt" in the other. This preoccupation bespeaks some conflict in his sexual role, which may be one of the dynamic factors in his general inhibition.

A final Rorschach indication of inhibition is the ambiequal experience balance (2:2.5), which according to Rorschach's original monograph points to an obsessive-
[154] compulsive adjustment. This man spends time and energy worrying about his psychological conflicts and possibly even about abstract or philosophical issues. For instance, during the inquiry of Card II, he asks, "What's the difference between form and shape?" Although he may merely be expressing some resentment toward the examiner and the inkblots, the other indications of obsessiveness, suggest that this question may be part of an overall pattern of doubting and indecision.

Although many of the FM are also guarded restraint movements, there is one that deserves special attention: "two birds falling to the ground...probably shot." This reflects a role concept in which the subject feels at the mercy of external forces; this would be much more disturbing if it had occurred in an M response. Appearing as it does in an animal movement, it suggests a role which he may experience in states of diminished consciousness or may have lived through in the past. It is clearly a role more appropriate under these circumstances. Is there any significance to the fact that this response follows the very blocked M ("two men trying to lift something")? Does the subject feel that if he makes too great an effort, he will "use up" all his energy and become helpless?

159*
156

notices whether others are noticing her. Still she does very little directly to call attention to herself, for beyond this concern she is basically extremely shy and inhibited. She is a highly pragmatic person, although she easily expresses strong emotionality. The test situation for Aunt May was simply one of the many strange requests, her good friends, the anthropologists, made of her.

125•

elated) Got a rope wrapped around him and he's just standing there. (21) Whole. () These little deals (horns) LL the ones up there on the wall (in a display case) (Note: the cave men refers to a peculiar custom on the part of a local Chamber of Commerce of dressing up in hides on festive occasions.)

VI

(22) W Fc'- at	19"	Well what in...what wd that LL...an X-ray of a person's lungs, I guess. Oh, let me see. That does LL a person's backbones and ribs, right in here.
(23) W Fc ad P		Then again it LL a hide, but there's shrubbery and it'd be hanging up this way (V), not the way you gave it to me. This is the tail part right here, but nobody ever cuts an A that way.
(24) W FM- a		It...Jungle Jim's little monkey or chimp; back to back with one another.
(25) D Fc'- a		If it had a head it'd LL a skinned badger or skunk.
(Add 48) D F- a		A magpie
(Add 49) W Mc h,ntr		Reflection of person walking in woods.

(22) Whole. () The backbone is down the center. (23) Whole, reversed. (Tail is top D) (24) Whole, reversed. () Two monkeys standing back to back...but they wd have to be standing on their tails. (25) Top detail, D39 reversed. () Just the stripes...light and dark. (Add 48) Top detail. And it LL a bird, an old magpie or smth. (Add 49) Whole, card to right. And then this way the water's edge right here (center line) rocks here, reflected down in the water. Clouds in the background. Trees and bushes. () The shade of it and way it's shaped. Plain as anything you can see a rock in here and an old dead log here. Further back there, here's somebody walking here in a dark shirt and light pants.

VII

(26) W FM a	25"	Well, if it didn't have such a small waist it'd be two bunny rabbits. See their ear and little feet. They're turned around looking at one another.
(27) W F± ntr		This way it'd be going into Skull cave in the Lava Beds...upside down. I wanted to get a picture of Valentine Cave so bad...
(28) S FCw Hh		Now the white part of that LL a lamp—or (traces w/finger) this is the shade and this would be the reflection out here (exterior S)
(29) W M h		This LL a girl, now. W/real bushy hair. Two girls, must be tied together...the way they used to punish children long ago...tie their hair together and hang them over the clothes line...
(Add 50) W M h		Or they could be toe dancers...such an imagination!

(26) Whole. (27) Whole, Space. () Here would be the rocks (main blot) () Just the formation of it. (Card reversed) (28) Space, reversed. (29) Whole, reversed. Or it could be toe dancers. (Add 50, whole, reversed)

VIII

Are you naturally pigeon-toed or do you just set that way? (!)

(30) W CF ntr	1"	Coral! In the bottom of the sea.
(31) W F,CF a,wa P		Or sm kind of Animal, and water down here and here's his reflection right here.

Rorschach Interpretation

159*
157

This is a rich, moderately well-balanced record, except possibly for overemphasis on W and consequent inattention to the usual details. However, the whole responses are generally adequate, the M responses are good, and the color responses balanced. The subject is apparently a woman who tends to deal with the overall situation, occasionally to the exclusion of the practical details of day-to-day living. She seems to be striving, planning as if in an attempt to achieve something. The high W and the emblem on Card I are consistent with this need to attain something. She has a wide range of interests and possibly is somewhat more cultured than most Klamath (R4, for example).

On the other hand, she is not a "driven" person, in the sense that she does not allow herself to have a good time. During the testing she apparently enjoys herself. She laughs, she sews, and she appears to be relaxed. She gives her rich imagination free rein, and rarely does it get beyond her control. Occasionally it does, as it will with anybody who just lets themselves go. (Note the "monkey standing on his tail" on Card VI).

Only seventeen of her 42 responses involved merely form as a determinant. The other twenty-five responses are determined either by kinesthetic (internal) stimuli, color, shading or a combination of these elements. Thus, the woman is relaxed enough to allow her emotions to influence her responses. Her comments also appear particularly relaxed, e.g., "I dunno what the devil these things are," or "Don't you write that down, you crook!" But what are her emotions and needs? Where in this full record shall we find the clues to her inner life?

Her six movement responses are very diverse: "men dressed as bears dancing," "guys making a puppet show," "fan dancers," "cannibal who just ate a carcass,"

157 *159 "girls tied together by hair," and "guys on cliff handing something to one another." The "cannibal" and "punished girls" responses are certainly aggressive enough, but what of the cooperation implied in the "guys on a cliff" response? The "men dressed as bears" and the "puppet show" are playful, assertive and free, while the "fan dancer" reflects that extra gaiety of which the subject herself seems somewhat abashed (she "breaks out in laughter"). These are all human movement-responses and thus the subject is capable of experiencing [155] all the diverse roles reflected. In a person with fewer other resources this might lead to unbearable conflicts, but in this woman there seem to be the strengths which make it possible for her generally to utilize this flexibility, despite the conflict. These additional resources are reflected in the use of color and shading (dark and light).

Her color responses are generally adequate and of a positive kind — although somewhat shallow. The presence of many responses to the black and white are interpreted by Oberholzer (1944) as further evidence of shallow, lazy affect. Thus, she probably does not get too deeply involved with people. She can get along with others moderately well, but she really does not need them.

[26] The presence of six popular responses and an F plus % above 80 are sufficient indication of her ability to attend to conventional aspects of the environment in a realistic manner, despite her tendency to experience her emotions.

[156] Nonetheless, there is the hesitancy in interpersonal relations which we have seen in most of the Klamath records. Here it is reflected in the disguise needed by the figures on Card II and the several aggressive M and FM responses. And she is still pretty unsure that the recent developments in her life are desirable; perhaps the old method of punishment was the best (R29). Probably the essential conflict in roles described above are the keynote of this woman's adjustment. Shall she "eat the carcass" or "lend a helping hand?" Shall she be a "fan dancer" or is any transgression punishable? The comments during the testing are both joking and veiled hostility: "Are you naturally pigeon-toed or do you just sit that way?"

But despite the richness of the record, the woman behind the record remains elusive. Could it be that her enormous flexibility in role taking has made it difficult for her to carry through one integrated life style to the extent which is necessary to call it her own? The Rorschach suggests that this may be the case. However, it is clear that her overall adjustment is a satisfactory one — perhaps eminently so.

*159 124 [150] [123] Weasel was tested while in jail. He agreed to take the tests via an intermediary, and was anxious and tense throughout the session. But because of numerous experiences in correctional institutions he was quite suave concerning the test situation; he has had them in batteries, the MMPI, the Bender Gestalt, the Picture Frustration Test, some variant of the TAT, but never the "ink-blot" test. The jail situation provided no special stress, and the testing lead to the development of something of a friendship relation with the examiner.

			I (S. entered the testing room visibly agitated, surveyed the room carefully and suspiciously.) What are you going to do to me? () No, I'm not worried, my hands are just sweating, that's all. (Looks under table at tape recorder) That isn't on, is it? () Etc.
(1)	W F emblem	30"	(Laughs) And is this supposed to LL smth? Well... well...it LL some kind of...Well I don't know. If it wasn't for the little spots it would LL some kind of coat of arms. (AE?) Trying to think of smth I seen one time...may be in fiction
(2)	D Fc (h)		A long, coated jelly...looked like that. Some kind of an animal...it was in this stuff, this jelly; but I don't know what this stuff wd be out here. (AE?) Maybe I'm kinda dense, but no more out here.

(1) Whole. (What kind?) I dunno to be truthful. () No, just the way it's shaped. I never have seen many coats of arms, but that's what it puts me in mind of. (2) Center detail, D1. () I dunno, it was supposed to be transparent. It was fiction, now I remember it. Some people was supposed to go to the moon in a rocket and came back with it. After it started growing it turned into a great big monster, a show on TV or a movie. (Fc here, as shading determined percept, which was seen as a figure thru the transparent jelly)

No. of Resp.	Score	Time	Response
			II
(3)	W,S c'C blood bullet hole	40"	LL a bullet hole. When you press the gun up close to smth and it goes off and makes this powder burn. The red spots LL they're blood. (AE?) That's about it.

(3) Whole, Space. () Just the blackness, I never have been close to a powder burn, but that's what it LL. () Those red spots. Maybe it just dropped down up there, but it LL it's splattered there (bottom red).

No. of Resp.	Score	Time	Response
			III
		27"	Doesn't look like anything, drawing a blank
(Add 9)	Dr Fc'C a, blood		Blackbirds with blood from their fighting.

(Add 9) (Anything now?) Is that the way I had it before? () Now it LL a cpl of black-birds. I dunno what this could be unless it was blood from their fighting. () I see their head and their beak and their little wing. () Dunno, they're black and the shape of their head and beak. () The red spots. (Entire top half of card from "waist" up, including reds)

159*
125*

IV
62" Don't LL anth. here. (Same on inquiry)

V
(4) W FM a P 10" LL some kind of a bat. That's it here.

(4) Whole. () It LL its wings are spread down this way (gestures) and his feet there...his head is turned sideways, and can't see his beak. Horns and feelers here. () Dunno, wings are just spread out like that (gestures).

VI
(5) W Fc' hide P 45" I see these things in my sleep...() Dunno, LL sm kind of a fox skin, that's all...cut open.

(5) Whole. () I guess it's a fox skin...hind feet and front feet...look like they're cut off. No tail, maybe it's cut off. Got the whisker's up here. () Just the outline. Don't see anything inside unless the dark line would be his spine, but I don't imagine his spine would be on there after his skin was off. () The inside...LL...() Just the way he's spread out, LL he's laying on his back. (S. becomes increasingly agitated and re-inquires as to purpose of test.)

VII
42" Don't LL anth to me. (Following, during inquiry:) No... (S. seems to be wanting reassurance, studies card intently.)

VIII
(6) W CF ntr 73" Kinda puts me in mind of coral rocks. I don't know if they're artificial or real, but I've seen 'em.

(6) Whole. () Actually I don't know if it was artificial but I've seen 'em in fish tanks with the little gold fish swimming around. () No, it's more the color of this than anth else.

IX
(7) W mCF expl 43" LL sm kind of an explosion, but I don't imagine they'd be colored like that.

(7) Whole.

X
(8) W CF art 30" LL sm of these pictures of modern art I've seen. But I don't know what you'd call them.

(8) Whole. () No, it's more the color of it than anth else. I don't know what it would be. I've seen the pictures, but I forgot the name of them as fast as I see them.

Rorschach Interpretation

*159 157 Aggressiveness, almost of a murderous kind, is the first impression one gets from this Rorschach record. Despite the fact that he gives only nine responses, we finish reading the record with the feeling that we know a great deal about this man, but we are no longer convinced of the extent to which he is comfortable with his feelings of hostility.

[158] Perhaps the single most conspicuous feature of the record is the blatant preoccupation with violence, especially in the context of such a brief record and in the light of the personalized quality of the verbalization: "When you press the gun up close to something and it goes off and makes this powder burn — the red spots look like blood." In addition to this hostile content (R3 and R9), analysis of the scoring summary indicates that the subject has inadequate control of these impulses. His Sum/C is 4.5, which is very high in a record of only nine responses, and there is no M and only one shading response. (After much deliberation, it was felt that there was insufficient evidence to score shading in R5.) Furthermore, only one of his responses was determined by the shape of the blot alone, indicating that in practically all situations the subject is likely to be directed by impulses and feelings, rather than by intellectual considerations. The possibility that the seven whole responses constitute ego control and personality organization is contradicted by an inspection of the nature of the W. Of these seven W responses, five and possibly a sixth must be considered vague, diffuse, primitive responses to the global impression of the blot.

There are a few possible indications of some control mechanisms which operate sporadically, however. For one thing, he does not blurt out his responses impulsively; there are relatively long initial reaction times to all the cards. Secondly, he does give attention to the shading elements (R2 and possibly R5). Nevertheless, these constitute insufficient controls for the tremendous energy available (Sum/c:Sum/C = 2:4.5).

The long initial reaction times, the few R and many of the verbalizations point to a guarded, suspicious approach to life. This finding, combined with the absence of M, is strongly suggestive of a paranoid adjustment. Life in general, and human relationships in particular, is seen as a struggle: the response closest to an M is the "fighting blackbirds." However, the subject does not have very strong attitudes about interpersonal relations. His feelings about people are shallow and ill-defined. He does not have close friendships: the figures on Card I, often seen as human, are seen by him through transparent jelly; he rejects Card III suggesting a human movement shock; and his few R suggest that he is unwilling to extend himself in the test situation.

[156] The "coat of arms" response suggests that what little feeling he has for human relationships is focused on the overt signs of social status. He is likely to

are marked by alternate periods of (brooding?) silence and she is more than a 159*
little pretentious, as for example her response to TAT card #1, "Oh, that's 157
that famous European violinist...Levi Strauss." Her life has been characterized [156]
by many extremely stressful situations, but she does not seem easily discouraged,
and maintains her vigor and independence. She tends to over justify herself, as [155]
if she had some doubt about certain of her characteristics, or as if she had
strong feelings of uncertainty or inadequacy. This is in strong contrast to her [156]
leadership role in her family, and her domination of many social situations. She
is also somewhat excitable and tends to directly express her emotions more than
many other Klamath.

The working relationship with Grandma was one of the best. When she first 159*
learned the writer was an Anthropologist she warmed to him immediately and 124
volunteered to take the tests. She was tested "on the job," at the top of a [123]
200 foot fire lookout tower in the midst of the Klamath forest.

(Add 27)	D	F-	at			More vertebrae, upside down.

(4) All grey. (Add 27) Card down, all grey. (5) Side red, D21. () The color and the shape of it. (6) Center red, D20. () The shape of it. (7) Headlike top of grey, D16. () A man w/ a long beard. What do you call them—goatee. This all belongs on the vertebra...the center of man's being.

IV

(8)	W	Fc'±	ad	P	3"	That LL a bear hide. I got a bear hide in my room. LL a bear hide. That's the only thing I can make out of it...a bear hide.
(9)	Dr	F-	at			Then the upper part LL it's a throat laid open like when you look in the physiology book...like part of the wind pipe. My goodness. That's about all I can make out of that one.

(8) Whole. () The outside of the bear hide BC of the coloring I guess, It's black. (9) Top center, D24. I still think there's some more of the vertebrae right here. (Note: E was beginning to get discouraged with recording vertebrae as additionals and indicating this to S.)

V

(10)	W	F	a	P	0"	That one LL a BF.

(10) Whole, either up or down. () Anyway I look at it it LL a BF and it still LL ...well just a BF. () Just a common BF. Of course they're not all black, they're all colors.

VI

(11)	W	F-	at		4"	That one LL throat and lungs. Like the inside of a person's body looks...all stretched out.
(12)	D	Fc'±	ad	P		It LL a little pelt of sm kind, stretched out.
(Add 28)	Dr	F	a			A tape worm.

(11) Whole. () Of course this is kind of terrifying with those little eyes up there...maybe he's got a tape worm. Ugh, that little head LL he's got a tape worm. (Add 28, top ½ of vertical column) (12) Bottom detail, D41. LL a link cat (bobcat) pelt...the coloring and everything, below the tape worm.

VII

(13)	W	F±	fd		11"	These LL shrimps all breaded and fried...to me... that's the way they come to you all fixed up. Other than that I don't know what it wd be.
(Add 29)	S	F-	at			More vertebrae

(13) Whole. (Breaded?) Well it LL that, all split in two and fried. (Add 29) Center space. And here I come back to my vertebra again...you can't get away from that one...the main part of life and the person's being...going up to the brain.

VIII

(14)	D	FM	a	P	16"	This LL sm kind of a little animal climbing up on smth...don't know what kind of A. That's a pretty color...lovely coloring. The whole thing is pretty colors, the grey, the green, the orange. He LL he's climbing up to demolish smth.

VIII Continued

(15)	(Not a scorable resp.)				(Score a R for coloring??)
(Add 30)	D	F	at	P	More vertebrae
(Add 31)	d	FM-	germs		Germs attacking the human body
(Add 32)	S	F-	at		Still more vertebrae

(14) Side detail, D57. (15) The whole, but prob. not scorable as a R. (Add 30) Riblike area, D54. (Add 31) Whole=body or lungs, germs are an association without specific location on blot, the association is from the preceeding popular animals. (Add 32) Lower center space, between feet of both pop. A's. (Note: the preceeding is a sorted out set of locations, the following the S's associations) It still LL that's the vertebra (#30) and it LL it's up here...like some kind of little animal attacking the human body...some kind of little germs... some kind of germ attacking the lungs...a germ of some kind. The vertebra again (#32). It's terrifying if sm kind of disease attacks you.

IX

(16)	W	F-,Po	at	105"	Gosh, I don't know what this would represent. Pretty, whatever it is...I don't know what this represents...some...LL the spine or smth. The spine going up and down...LL the pelvis itself... I imagine that's the way we look inside...either this way or that way...must be some part of the body...it LL little kidneys down here...it's pretty, whoever colored that...sure blotted that one nice.

(16) Whole. That LL the large intestines...this the lungs, because it's up there. This must be the kidneys, and this must be our rump and stuff down here, where it's thick, see?

X

(17)	D	F	a	P	5"	Another lovely coloring...there's that same little... same expressions of the little...grasshopper head.
(18)	D	F	a	P		Heads of crabs.
(19)	D	F-	at			Pelvis bones again
(20)	D	C	at			The gall down here...the green.
(21)	D	F-	at			It's sure a terrifying picture...the appendix all inflamed.
(22)	D	F-	at			The throat again.
(23)	D	CF	at			The walls of the stomach...the ulcers of the stomach badly diseased...boy that's lovely coloring.

(17) Pop. rabbit, D73. See you can't get away from that vertebra...that spinal column there. (18) Side blue, D76. (19) Location uncertain. It's not the pelvis, it's still some more of the vertebra. (20) Bottom green, D72. It was the green. (22) Throat=vertical column in top grey. There's bugs attacking it...diptheria I guess. (21) Bottom green, D74. (23) Bottom yellow, D71. (Compare with Loc. Ch.) It's all still there...just the same, don't make no difference.

Rorschach Interpretation

*159 157 The Rorschach reflects a woman who is extraordinarily preoccupied with disease (at = 10+5). If she is not physically ill, she is hypochondriacal and perhaps suffering from somatic delusions (at R; F+%, 52). She is likely to be very ill at ease in interpersonal relationships (M on Card II), probably because she is demanding of attention from others (C:CF:FC). I wonder if she doesn't use physical illness in order to be taken care of.

[156] The test results indicate that she views interpersonal relations as terrifying struggles in which she may be "demolished" by others. Since her only M in human content is "a couple of men testing their strength" and her Sum/C:Sum/c is 3.5:0, we would say this is how she acts in interpersonal relations at this time. She "tests her strength" — but cautiously. The figures are "in disguise," they are not to be trusted. In meeting people she has to decide whether she is strong enough to be safe, or whether they are so strong that they would harm her.

The FM, on the other hand, are aggressive "climbing up to demolish something," "germ attacking the lung," "bugs attacking throat." This is the enormous aggressiveness of which she is afraid, but it also indicates that she is capable of experiencing this kind of hostility toward others. Under stress or "in states of diminished consciousness" we may see some extremely aggressive behavior on her part.

Since I scored R20 as a pure C response and there are 2CF and no FC, we must conclude that S does become overly emotional at times. They may be "crying spells" or expressions of the anger indicated in the preceding paragraph which she is unable to control. I scored R8 and R12 as Fc' but they may be Fc. If they are Fc' they support the notion that our S has little control over her feelings. The great variability of her initial reaction times also bespeaks of sporadic impulsivity and feelings of anxiety.

*159 158 The more one thinks about it, the more pathological the picture becomes. F plus percent is only 52 despite the 6 populars; there is a positional response on Card IX; there are a few peculiar verbalizations, e.g., the vertebrae and brain being referred to as "the center of man's being" and "the main part of life and

Fidel quit school because of what he defines as "family trouble," and this failure is probably equally due to his lack of support and training at home, as well as from the mildly hostile, indifferent posture he maintains. He expresses bitter contempt for his family, for the filthy house, for the lack of regular hours, and for the frequent squabbles. His isolation from this group is adequately measured by his lack of knowledge of the interests and affiliations of family members. His contempt for them is balanced by his father's derogatory, competitive attitude towards his son and his mother's indifference. Fidel stands thus, mildly hostile, ambivalent, and infinitely bored, at the brink of independent adulthood.

Rorschach Interpretation

159*

Three aspects of this Rorschach protocol stand out: the absence of color responses; 157 the emphasis on movement (of his 14 scorable responses, 12 involved human or animal movement); and the nature of the movement response on Card VIII (R12): "He looks like he's got a grin — I mean a mean look on his face." The content [156] of this movement response suggests that the subject is strongly ambivalent about his role in human relationships. His immediate response to an interpersonal situation is an open, friendly one, but for some reason he shifts to a more aggressive menacing role. It is as if he tries to conceal his immediately positive response to people behind a "mean look."

On the face of it, the absence of color responses seems incompatible with the hypothesis that this man is involved emotionally — either positively or negatively — with other people. However, when we note that the subject is not indifferent to the color aspects of the cards, the interpretation becomes not inconsistent, but richer. In response to Card II, for example, he states, "How come they put different colored ink in them?" The absence of color responses suggests not that the subject is uninterested in personal relationships, but that, since he is unable or unwilling to integrate the color aspects of the blot with the shape of the blot, he probably reacts to the emotional aspects of interpersonal relationships, but does not make the effort required to integrate his feelings with the demands of reality.

How are we to interpret the fact that of 14 responses the subject has 12 movement responses? We must conclude that he has a rich and extensive inner life; he probably gives much thought to the significance and meaning of a situation without giving any overt indication of this thought. The fact that he waits for the examiner to finish writing, for example, indicates that he is aware of what is going on around him.

Five of this subject's six human movement responses are of the guarded restraint variety: "two girls looking at each other," "a man standing there" and so on. His prototypal role, then, involves watchful waiting and a tendency to inhibit the expression of feeling; this inhibition has apparently generalized to a considerable extent (narrow range of content). Perhaps the most revealing response, though, is the frightening "bug with wings" on Card IV. There is a feeling of dark shock here; he tells us after 33 seconds that he doesn't know "what the heck this is." And, on the basis of the inquiry, "It's reaching for you or something" we would have to conclude that the subject is frightened by the aggression implied here.

On four of the cards — involving eight of his fourteen responses — the subject gives an identical response to the blot when seen upside down as when seen right side up: "That's the way it looks — both ways, upside down and the other way." Although this mode of response does occur on occasion, rarely does it assume

(4) Phobic responses (R6, R12)

Rorschach Interpretation

This adolescent girl — for whom "a smile is rare" — appears to be an intense, introspective person: movement is involved in eight of her thirteen responses. But there is insufficient responsiveness to external stimuli (no color responses with the possible exception of R10) and too much of her fantasy appears morbid or at least phobic ("Dracula" on Card IV and "monster" on Card X). Is she really this terrified of authority? The test suggests "yes," but that she won't admit it readily.

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all aspects of the preceding case studies we intend to pursue some of the implications of certain striking characteristics of Klamath personalities. Aside from this descriptive effort we also intend to derive, hypothetically, an association between these personality attributes and Klamath acculturation experiences. 121

Certainly the most pervasively shared attribute of Klamath personalities is the one we have chosen to call guarded restraint. This label is intended to designate the general attitude towards self and interpersonal relationships which has emerged from the analysis of Rorschach records, life-history materials, and observations of behavior. Guarded restraint, therefore, may be taken to mean the prevalent suspicious and guarded attitude towards life of the Klamath subjects, their wariness as regards significant others, and their apprehensions as regards their environment generally. This attribute, as we conceive it, has many facets. It includes an unconscious as well as a more deliberate muting of responsiveness to the actions and the mere presence of others, a shallow, non-committal attitude towards membership in various social groups and the goals of these groups, and a characteristic which ranges from simple lack of trust to outright fear of the behavioral milieu. 156 157 [12]

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem somewhat ambiguous. The empirical referents on the level of observable behavior are, however, highly visible. They may be observed in a wide variety of behavior settings, from the informal and unstructured relations within a teenage clique or an adult drinking group to the more organized setting of the family and household. 121

The psycho-cultural phenomena we have labeled as guarded restraint over-laps with what others have called Klamath individualism. Seen in this perspective, we may, perhaps, introduce a somewhat richer way of analyzing and gaining insight into the nuances of Klamath behavioral styles. This approach is, we hope, something more than just a different way of looking at the manifest separatism and incohesiveness of family groups, a more fruitful manner of examining the atomistic structure of Klamath reservation sodalities, and a means of appreciating the psycho-dynamic causation of the constant fractionation of Klamath political groupings. The evidence of these case studies, then, suggests that few Klamath are capable of fully identifying with other persons or of committing their loyalties to concerted group action. 121 157 [156]

We feel that this major descriptive conclusion is, in large part, a product of the case study method used in analyzing the Rorschachs. Moreover, it is our belief that this conclusion could not have been obtained from an analysis of a composite psychogram based on formal scores. As anyone who has ever read reports based upon the statistical or modal personality approach well knows, such reports are ridden with dynamic cliches and are largely sterile until filled out with examples of the qualitative features of individual records. In this report Levine has entirely discarded the lumping of group scores and concentrated upon an analysis of qualitative features of individual records buttressed and supported by the use of formal scores and relationships. The importance of this approach is shown by the fact that the reserve and guardedness that characterizes Klamath does not always show up in individual test records in the same form. Most frequently an important clue is had from the presence of restrained, watchful, wary figures in human and animal movement responses. Indeed, this type of movement 125 128 [157]

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

157 One facet of Klamath guardedness and restraint is the general reluctance of
Klamath individuals to reveal or communicate to others their needs, wishes, interests,
156 or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another characteristic
of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath seldom
[125] have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
657 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insulation
[158] of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
In the instance of Slim, for example, we find that a superficially adequate adjustment
158 may simply be the manifestation of an obsessive control over and reduction
[121] of emotional and intellectual processes to the point of a tentative diagnosis
of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are
examples of extremely loose, unrealistic and disorganized thinking with overtones,
in some instances, of an almost paranoid suspiciousness, or a reliance
upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic
role or personna which is very poorly integrated with the rest of the personality
is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's
superficial warmth. We suggest that these more disordered aspects of adjustment
may profitably be seen, in part, as a function of a generally poor contact with
others, reduced insight into the self and others, and extensive social isolation.
The mediating difficulty may well be a relative absence of opportunities to validate
beliefs and convictions. Thus in many respects adaptive, Klamath guarded
restraint probably serves as a precipitating factor in thinking disorders, sociopathic
adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

(311) PO: Is that so? (312) I never heard that.

(313) AC: Then Yainax [from Klamath /ẏayńaks/]—it is a little mountain, there where (Proper name) killed that white man a long time ago, on that little mountain having led him up high there. 539* 124

(At this point the tape came to an end, and the conversation was broken off.)

Introductory Note to Text 39

This text was elicited with the aid of a series of fifty line drawings, prepared under the supervision of Alfred S. Hayes, as described in his article, "Field Procedures While Working with Diegueño" (International Journal of American Linguistics, vol. 20, pp. 185-194, 1954). Each drawing depicts some simple situation, and the informant is encouraged to describe the scene and make some theorizations about what might be going on. The numeration corresponds to the numbers of the pictures. The separate utterances are not otherwise numbered. 125

39. Response to Pictures

(Mrs. Pansy Ohles)

(1) What is he pointing at that tree for? One man seems to be pointing toward that tree, unhealthy [lit. "bad looking"], very thin. And what is this? A road, perhaps, I do not know. 539* 125

(2) These are two men. Perhaps they are walking around to plow or perhaps to cut hay. This one is pointing, one. And this tree stands in the open, alone.

(3) So these are three, four men also. These are four men. And one little boy way over there, but these are large. Again this one is pointing. What are they pointing at? I do not know. However, a road is running along—isn't this a road running along?

(4) Two men, one is running toward the tree. Perhaps he will relieve himself. But this one, I don't know what they are doing. Again he is pointing. What can be over there? And these are two roads.

[TEXT CONTINUED ON PAGE 179]

(5) These are three men again also, the little one is absent in this picture. What is the matter? Maybe he is behind the tree.

(6) This is he again also—perhaps somebody else is running toward there. Yes, he is running. He is going fast. But these are walking. But whatever is this one pointing at, always?

(7) This is a woman. She is pointing too. [Her hair] is not combed.

(8) This man has come now. What is he doing here? This one is pointing again. This man has come now, as I said.

(9) Ya···, [she] has many men, two. [Her hair] is not yet combed. What are they pointing at? Perhaps someone is coming.

(10) This is a mother saying, "Go relieve yourself over there behind the tree! Don't let them see you!"

(11) Could this be the father, his, who is running there, towards the tree, again. Perhaps to relieve himself. This is a road. And perhaps they are saying, "Hide behind over there! Hide behind the tree!" And this is a different tree again. And perhaps this one has messed himself [lit. "relieved himself on himself"]—he has messed himself now. (See, he's bent down a little more, and he must have messed himself.)

(12) And these two men have come. I do not know who they are. Perhaps the father's—what? Older brother, perhaps?

(13) What is this? Perhaps a little girl? Again pointing! Towards there. I don't know why. That is a different tree also.

(14) "Ohhh, father, come and look here, what is this!" Pointing again.

(15) Perhaps there is a magpie's nest there. Perhaps she is pointing up at it. These are two men, and one little girl.

(16) This is a little girl again. Perhaps they are playing something. Perhaps he will hide from her, and she will find him, this little girl. This one is well combed.

(17) This one also is well combed. And this one says, "He is hiding from me there, he goes to hide behind the tree, but I see him." This man is something—possibly the father or perhaps the grandfather [father's father].

(18) These are two now, two children, aren't they? A little boy and a little girl. They are perhaps brother and sister, and [these men] are perhaps [their] father and uncle [mother's brother].

(19) A dog. He is sitting under—under what? Perhaps a chair? Perhaps a table. The dog has a long tail, and perhaps he has a broken back?

(20) This dog keeps jumping up and down, to look out through [lit. "toward" the window.

(21) This one is eating bread, the dog standing on the table. This dog is a thief.

[TEXT CONTINUED ON PAGE 181]

(22) This man is giving [food] to his dog. He's giving something, he's giving food. Not bones. Perhaps he is giving water.

(23) This is some bird—"quail"—perhaps this dog is bringing this quail home in his mouth.

(24) This is a little badger. This is winter—this tree has no leaves. And this dog the badger—no, not a little badger—it is a little rabbit. He is chasing the little rabbit.

(25) This dog is hot.

(26) This is a cow, eating in the open. A mountain, perhaps near a river. The mountain is over there. I don't know which mountain it is.

(27) This one is planting [lit. "putting down plural objects"]—perhaps he is planting corn. And it is very early also—this tree has not yet leafed out. Now it is spring.

(28) How is this, he is leading the horse not having tied it on well. This rope is not well fastened around its neck. Perhaps because the horse is tame.

(29) This is without a saddle, without a rope, without anything. However, he is going home riding it perhaps toward home, perhaps going back to the stable.

(30) This one is climbing to get [apples], this one, perhaps to pick apples. He is climbing to get [apples].

(31) Ya···, isn't this a snake! A woman and two men, and they are saying, "Ya···, there is a snake over there!" Across this divide (Maybe?) They are standing on the edge, and the snake is on that side.

(32) Two snakes. And they are three on this side again. I do not like snakes.

(33) Ya···, now this one is chasing them. One has fallen in, the woman is running, the man too, and he runs with his hands thrown up. This one, being frightened, has fallen in here. Perhaps he is falling into the water.

(34) What is this? The sun is rising. And this something—it is not setting. The sun is rising. Early in the morning they always something—the white man's canoe—"sailboat"—sail. And this is a piece of wood lying here on the edge.

(35) This one is going in a canoe, now at sunset. And he is saying, "Now I'm going back." He came to see the woman. Perhaps his sweetheart.

[TEXT CONTINUED ON PAGE 183]

(36) Now they are visiting. And they have just sat by the edge. However, they didn't go to fish, they have no fishpole. So this is setting, perhaps, just about to set.—Ohhh, I did not see this, a pelican soaring around.

(37) Many, many trees. What are these? "Peaches" perhaps hanging up there? Why didn't they tell it, so I would know what to call them. This is a fence running along—is this someone's land? This is a fence running along.

(38) Now it has grown big, that which they had planted. The corn. I don't see anything else. Now no one is picking any. The corn is not ripe also.

(39) A tree standing on the edge. It is just one tree standing on the edge alone. That is a mountain across there—"Mount MacLoughlin" perhaps?

(40) I only see hands. A thumb. Ugly hands. Perhaps this one is hurt, he has injured hands. One is very fat, one is not.

(41) What is this? Bleeding? Perhaps water is dripping, perhaps blood. Perhaps they cut them off. Perhaps they are washed, in water. I don't know.

(42) This woman is going toward the table, to put something on the plate—perhaps to take away the plate.

(43) She is carrying it along [plate], perhaps taking something back, towards there. She is carrying some plate.

(44) This is a stick lying here. Why is this, the stick here? Will he beat somebody?

(45) Ohhh, he is going outside to beat somebody. He is going, carrying it. Perhaps he will beat somebody outside. Perhaps he will hit his wife.

(46) These are going to church, leading their children, looking nice. Yes, all are well combed, and they are smiling. They are going smiling, and they are not pouting.

(47) Who are these? "Lone Ranger and Tonto"? I don't know what this is, something—they are standing on a cliff. A slope is not thus. This is a cliff.

[TEXT CONTINUED ON PAGE 185]

539 #
125 •

(48) Ohhh, children on the other side. And this one [says], "Come back! Come back! How did you [pl.] cross over the cliff there?" Perhaps he says to them, I don't know.

(49) This one says—how is this? Perhaps this is the father and this is his daughter. And he has taken his daughter across, and that man on that side is angry. "How did they cross over here!" There is no bridge. Will he put his foot across—perhaps Crane will stick out his leg?

(50) "Ohhh, I found a dollar!" So then, "It is mine!" And then this one says, "No, it is mine!" Then this one will pick it up. "I can stoop over better."

[P. 186 is blank]

This is also a man's game played by about six in a row on each side. Two men are each provided with two short bones, one of each pair marked with a black band. These two change the bones from hand to hand as they sway from side to side crossing and uncrossing their arms, their companions accompanying them with swaying and song the while. The opponents guess the hands which hold the unmarked bones. Twelve sticks for counters are stuck upright between the contenders. As with the four-stick game the successful guess wins the right to hide the bones; at each failure the hiding party takes counters from the neutral pile and, when this is exhausted, from the opponent's winnings. Here too the guess is indicated by a particular and characteristic gesture. In the diagram below the bones are represented as in the hands of two men seated side by side; the crosses indicate the marked, circles the plain bones.

Name	*Arrangement*	*Movement*	*Counters taken by hiders*
yo'skis	xoox	Hand edgewise down middle	2
skĕ'tc!ôs	oxxo	Prone hand forward	2
woi'is[118]	xoxo (or oxox)	Forefinger to right (or left for the second arrangement).	1

When each side has six stick counters, it is called ŏtano'ga, now cooked. The side getting all twelve wins.

Dorsey describes the bones as three inches in length, two wound about the middle with buckskin. The wound pair are called skútash, tied around, or hī'ewŏks, men, the others solsas, female (?). The counters he renders kshesh.[119]

My informant reported that the Pit river people have short bones which they roll in grass between their hands, and toss into the air. [184]

The beaver-tooth dice game (sko'sĕ) has its usual simple form. It is played perhaps more frequently in winter than in summer, and while primarily a woman's game, both men and women play together. The dice are the four crescentic incisor teeth of a beaver, ground hog, or ground squirrel, or bits of wood.[120] The upper teeth (called hīc-

---

[118] These names, which are identical with those for the four-stick game, were given by the same informant but on a different occasion. The names given here are probably correct for both games, hence Dorsey, Gatschet, and my own doubtful alternative for D above, are evidently all wrong. Arrangement A cannot occur in the hand game, of course, since each man must have an assorted pair. [114]

[119] Dorsey, *op. cit.*, 22. In 1930 I collected two sets in which one pair was encircled by a carved and painted fillet. [126] •

[120] The Northern Paiute use long sticks for this game, according to this informant. [171]*

LETTER OF TRANSMITTAL.

SMITHSONIAN INSTITUTION,
BUREAU OF ETHNOLOGY,
Washington, D. C., June 25, 1890.

121 SIR: I have the honor to transmit to you my report upon the Klamath
Indians of Southwestern Oregon, the result of long and patient study. It
deals with their beliefs, legends, and traditions, their government and social
life, their racial and somatic peculiarities, and, more extensively, with their
126 language. To this the reader is introduced by numerous ethnographic
124 "Texts," suggested or dictated by the Indians themselves, and accompanied
by an interlinear translation and by "Notes," a method which I regard as
the most efficient means of becoming acquainted with any language. In
121 this report I have given prominence to the exposition of the language,
128 because I consider language to be the most important monument of the
American Indian. Archæology and ethnography are more apt to acquaint
us with *facts* concerning the aborigines, but language, when properly investigated, gives us the *ideas* that were moving the Indian's mind, not only
recently but long before the historic period.

Repeated and prolonged visits to the people of the northern as well as
of the southern chieftaincy have yielded sufficient material to enable me to
classify the language of both united tribes as belonging to a distinct family.
101 In their territorial seclusion from the nearer Indian tribes they show anthropologic differences considerable enough to justify us in regarding them as
a separate nationality.

197 There is probably no language spoken in North America possessed of a nominal inflection more developed than the Klamath, although in this particular, in the phonetic elements and in the syllabic reduplication pervading all parts of speech, it shows many analogies with the Sahaptin

000 they are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can deny."*

THE PREHISTORIC PERIOD.

174 Before the middle of the nineteenth century the Mák̲laks people was unknown to mankind except to the nearest neighbors in Oregon and California. We are therefore justified in beginning its period of documentary history at that time, and in relegating to the domain of prehistorics all that is known of their previous condition. The information upon these points is furnished by three factors: tradition, archæologic remains, and language.

A. TRADITION BEARING UPON HISTORY.

121 Traditional folk-lore, when of the mythic order, generally dates from
773 an earlier epoch of fixation than historic traditions. The remote origin of *genuine* mythic folk-lore is sufficiently evidenced by the archaic terms embodied with it, by the repetition of the same phraseology for ages, and by the circumstance that all nations tend to preserve their religious ideas in an unchanged form. I am laying peculiar stress upon the term *genuine*, for Indians have often mixed recent ideas and fictions with archaic, original folk-lore and with ancient mythic ideas, the whole forming now one inextricable conglomerate which has the appearance of aboriginal poetic prose.

173 The Klamath people possess no historic traditions going further back
769 in time than a century, for the simple reason that there was a strict law
688 prohibiting the mention of the person or acts of a deceased individual by
171 *using his name.* This law was rigidly observed among the Californians no
784 less than among the Oregonians, and on its transgression the death penalty could be inflicted. This is certainly enough to suppress all historic knowledge within a people. How can history be written without names?

[126] Many times I attempted to obtain a list of the former head chiefs of the two chieftaincies. I succeeded only in learning the names of two chiefs recently deceased, and no biographic details were obtainable.

174 This people belongs to the autochthonic nations of America, called so because they have lost all remembrances of earlier habitats or of migrations.

---

* Contributions to Amer. Ethnology, III, p. 253.

124 hold affairs, and terms referring to colors; men more appropriate than women in instructing him about their hunts, fishing, travels, their legal customs, wars and raids, house-building, and similar work. Omit asking them about the deceased, for it makes them angry and sullen. They do not as a rule willfully lead the investigator into error when they see that he is in earnest. Errors often originate in preconceived notions or theories and inappropriate questions of the investigator, sometimes also in the want of abstract terms in the interpreter's language. To insure correctness in an Indian myth, animal story, or any relation whatever, it should first be taken down in Indian, and of this a verbatim translation secured.

114 Ethnographic sketches of both tribes, but chiefly of the Modocs, were published in the newspapers of the Pacific coast at the time of Ben Wright's massacre, but they were not accessible to me; more circumstantial were those written at the time of the Modoc war (1872–'73), and specimens of these may be seen in A. B. Meacham's publications, in the "Overland Monthly" of San Francisco, and in Stephen Powers's "The Modok," in Contributions III, pp. 252–262.

126. Ethnographic objects manufactured by and in actual use among both tribes were purchased at different periods by collectors. The National Museum in Washington owns several of them; but the most complete collection is probably the one made in 1882 by the Swiss naturalist, Alphons Forrer, a native of St. Gall, which was partly sold to the Ethnographic Museum of St. Gall, partly (eighty-five articles) to that of Berne, the capital of Switzerland. Forrer lived several months among the Klamaths, and thus was enabled to secure the best specimens. There are two hänäsish or "magic arrows," an implement which has probably become very scarce now. The majority of these objects are manufactured from wood, fur-
134 skin, and basket material. There is no suitable clay found in the Klamath
323 River Highlands, hence these Indians never made any pottery.

114 The report of Lieutenants Williamson and Abbot contains a large array of astronomic positions and of meteorologic observations made during the expedition, which will prove useful to later observers. The zoölogic, botanic, and geologic reports made by different scientists were considered of high value at the time they were first published. It will be remembered

538 and locutions, repeated from generation to generation, are not always under-
[173] stood at the present day by the young people, who most attentively listen to the aged rhapsodists, when they expound these miraculous stories in the lurid glare of the nocturnal campfire. Nothing in them indicates a migration of these upland tribes from any part of the country into their present homes, and hence the Mák̲laks must have had undisturbed possession of the headwaters of Klamath River for some centuries prior to the advent of the white population.

197 The various texts obtained clearly exhibit the character of the lan-
538 guage actually spoken and the difference existing between the two dia-
124 lects, but they do not all possess the same linguistic value. The texts of Dave Hill and others are worded in the conversational language of the tribe, which in many particulars differs from the more elaborate and circumstantial mode of speech which appears in the mythic tales given by
124 Minnie Froben. The "Modoc War" and some of the shorter pieces could be
126 obtained only by putting down the English first and then getting sentence for sentence in the dialect, whereas the best worded stories and specimens were written in continuous dictation. All texts obtained were carefully revised first with the informants, then with other natives, and all the necessary explanations added at the time.

533 From a purely linguistic view the popular songs or song-lines are the most valuable contributions. The melodies of some of their number deserve to be called pretty, according to our musical taste. To the natives all of them appear harmonious; but when the Western Indian calls some melody "pretty," guided by his musical principles, he very frequently does so in opposition to what our ear tells us to call by this predicate.

124 The Klamath Lake dialect was spoken by the majority of the con-
191 tributors to my linguistic anthology. I obtained these specimens, with the exclusion of the Modoc texts, in the autumn of 1877, at the Klamath Reservation, Lake County, Oregon. Though many of these natives speak the Chinook jargon more fluently than English, I never availed myself, for obtaining any information whatever, of that imperfect and hybrid medium, through which the Indians of the Northwest carry on so much of their intercourse.

9: Barker L-5 (1955-1957) 1963
NR10 Klamath NR10

INTRODUCTION

114 The texts presented here were collected during the summers of 1955,
1956, and 1957 which were spent among the Klamath Indians at Chiloquin,
122 Oregon. The field work was carried out under the auspices of the Survey
of California Indian Languages, Department of Linguistics, University of
115 California, Berkeley. The narrators of the myth texts were Mr. Robert
David, Mrs. Pansy Ohles, and Mr. Grover Pompey; the ethnographic materials were obtained from the first two of these and from Mrs. Aggie Butler, Mrs. Grover Pompey, and Miss Irene Skellock.

126 Most of these texts were recorded directly on tape, but some were taken down first in dictated form and were taped later. Of the myths, only Texts 1 and 7 were not recorded on tape. Of the ethnographic materials, Texts 24, 25, 29, 30, 31, and 35 were dictated only.

[124] No really exhaustive attempt was made to obtain a complete collection of Klamath myth texts. Instead, the author aimed at a representative collection of materials, including myths told by several informants, autobiographical experiences, ethnographic texts, historical incidents, conversation, and also the responses to a series of elicitation pictures (Text 39). It was felt that these texts would provide, on the one hand, good illustrative material for further linguistic studies in Klamath, and, on the other hand, a representative sampling of myths and ethnographic material of interest to the folklorist and ethnologist.

114 The collections of Klamath myths so far published are limited to A. S. Gatschet's "The Klamath Indians of Southwestern Oregon (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890) and some brief song and medicine texts in Leslie Spier's "Klamath Ethnography" (University of California Publications in American Archaeology and Ethnology, vol. 30, 1930). More recently, Dr. Theodore Stern of the University of Oregon has collected a large number of Klamath myths. The author understands that Dr. Spier also possesses a collection of myths. It is urgently hoped that both of these will be published in the near future.

128 The present collection is divided into two major parts: Myths, and
773 Ethnographic Texts. The former contains tales about the inhabitants of

Introductory Note to Text 4

124 After giving the foregoing three texts, Mrs. Ohles was strongly hesitant about giving more. She felt that she had forgotten too many of the details which make the text "correct" to a good Klamath storyteller. She pointed out that she could neither recall the names nor the kinship relationships of the lesser characters, and she felt that she was omitting incidents and garbling the action.

At last, however, Mrs. Ohles kindly agreed to relate all she could remember of the story about the red-haired woman of Sprague River. She had previously narrated this in English to the author, up to the point where Gmokamč enters the story. She began the myth with the [126] author recording it in his notebook only (she felt the tape recorder might confuse her), but after she had gained confidence, the remainder of the myth was tape-recorded. When she reached the end of her previous English narration, she continued with incidents leading into the Gmokamč myth—much to the surprise of the author, who had not seen versions of the Gmokamč story beginning in this fashion anywhere else. The stimulus for this may have been provided by Gatschet's recorded texts,[19] which the author had shown her some days previously. At that time she had recalled these myth incidents easily as part of the corpus of material she had heard in her childhood and since forgotten. With this as a crutch to memory, she produced the text given here. She felt that her version was more generally correct and that Gatschet's texts were only short incidents taken from a long cycle of connected [538] incidents. This cycle, she said, might take three or four days in the telling by a really proficient storyteller. The action and final conclusion of her version she felt to be correct, but she was sure that many minor incidents and characters had been omitted.

This text differs from her previous ones in that it is more conversational and less formal in style. She comments in English and Klamath on her story, makes side remarks to the author and jovially berates him for getting her to tell a story she only partially remembers, and breaks into English at difficult points to supplement half-remembered "hard words." Mrs. Ohles' style in this text is valuable as a sample of less formal Klamath discourse. She contrasts strongly

here with her previous impersonal narrations and with the even less personal text styles of other informants, whose stories and ethnographic material were always given as objective verbal "essays." 124

---

[19] Gatschet, "The Klamath Indians of Southwestern Oregon" (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890), pp. 99-123, 142-148. The present author read some of Gatschet's texts to Mrs. Ohles, and she was able to recall other incidents and versions.

Some time after the text was recorded and analysed, the author felt the need of having the entire myth on tape, rather than half in notebook form and half on tape. Mrs. Ohles kindly agreed to begin the story over again and told it right up to the point where she had switched to the tape-recorder before. This second tape-recorded beginning is appended to the text and serves for a comparison between pen and notebook dictation and tape-recorded discourse. [126]

Mrs. Ohles felt that material irrelevant to the story should be stricken, since it made the story "incorrect." The author feels, however, that such side remarks illustrate Klamath conversational style and give insight into her attitudes toward the myths and towards other facets of semi-acculturated Klamath culture. This material is, therefore, reproduced within parentheses both in the Klamath text and in the translation. Her English remarks are conventionally spelled but otherwise unchanged. [128]

(12) ćasga·y honk ʔat siwga, ʔi·metga.

---

[126]
[124] [41] This text was not taken on tape, but only by dictation. Mr. Pompey stated that this incident was but a small part of a longer myth cycle, though he could not recall more than fragments of the rest of it. Cf. Mr. David's text in which Qalo·qa·qaqs appears (Text 17).

[196] [42] The sequence /suksuksuksuksuk/ is almost voiceless, and the syllables are uttered at a rapid rate of speed. This and whistling were said to be the commonest methods of calling a dog in ancient days.

[231]
[193]
[196] [43] The use of (se̲) "reflexive-reciprocal action" (2pv) is not clear here. ‖se̲delwga‖ means "attack each other" or "attack oneself," but the utterance contains an "accusative" /ćasga·yas/. Utterances in which (se̲) has reciprocal meaning invariably have all parties to the action as subjects.

539*
861

will be that way too, sometime. (41) All of us will be thus, we will grow old." (42) Thus my old man [father?] told us—often to us in the evening—even in the evening he spoke to [us] thus. (43) In the evening, [as] we were sitting around the fire, in our house.

(44) And he always advised me thus, "Living like that is good," he said. (45) "If you do anything [wrong] like that, then you will never be able to live here—if you would be a trouble-maker—no. (46) Everything would hem you in, evil. (47) And the law would also follow you. (48) They will always catch you," he said. (49) "[You] can never hide from the law today. (50) The white men have brought us the law. (51) So we will do thus—now we follow it, we have with them—divided it recently—since we divided up the country with them—so we will do thus. (52) We will live as they have told us, having laid down the law on this reservation. (53) And they want us to live in this way, as long as we do not do thus, evil. (54) Then they would take us there, and they would put us inside, there where you do not come back out." (55) Thus they told us, long ago. (56) That's as far as [I will tell it].

[177]

Introductory Note to Text 38

The informants for this text were Mrs. Amanda Cowan, Mrs. Pansy Ohles, and Mrs. Cowan's son, Ransome. Mr. Andrew Ortiz, Jr., a young Klamath friend who does not speak the language but who has a great interest in the old ways, was also present.

Mrs. Cowan is reputed to be the oldest living member of the Klamath tribe, and her age was variously reported as 100, 102, and 104. She retains all her faculties, and the day the author's party visited her, she was spry and cheerful and delighted to help the author understand her language.

Mrs. Ohles began the conversation by describing one of Mr. David's myths (Text 13), which she had heard on the author's tape recorder, to Mrs. Cowan. The machine was turned on at this time, and the conversation was left to run more or less freely thereafter. Later, the author asked about various Klamath forms whose meaning he was unsure of, and also about animals and plants, hoping to add to the corpus. Near the end of the session, Mrs. Ohles discussed kinship relationships and

[126]

[TEXT CONTINUED ON PAGE 157]

127 formerly it was not set on stakes. He referred to mention in a myth of its use as a hand net. At any rate, of recent years it is set on stakes in the lake or rivers. It has a small mesh, is forty or more feet in length, three feet in width, and provided with sticks or dry tule stems in order to float the upper edge, and sinkers in order to weight down the lower. The sinker (lĕ'mdi'as) is a pebble three to four inches long, grooved about its middle through pecking it with a hard pointed stone.

284 462 Nets are manufactured by men, although a few women also make them. They have meshes of several sizes. A net gauge (tŏŋks) of bone or wood is used with a slender shuttle (tcŏ'mdlĭkŭs) wound end over end.[230] Nettle bark cord is used, from either brown or gray nettles (slĕ'ĕts). Coville notes the use of Rocky mountain flax fibers.[231]

The fish traps used by the Klamath are strictly speaking not traps at all, since there is no closing device to prevent the escape of the fish. They are very little used. I was told of only one place where the device is used, a little stream above Spring creek on Williamson river, where the water is so clear that the actions of the fish can be watched in detail. There it is used only in winter to take trout. The trap (spuwɛm) is a cylindrical basket of willow branches, woven in open twine, six feet long and two in diameter, closed at one end. The opposite end is open and not provided with reversed barbs or other device to prevent the fish leaving the trap. Cords are tied to it so [114] that it may be hauled up when the fish is seen to enter. A trap of this sort figured by Barrett,[232] but of only half this length, has one side extending somewhat beyond the mouth. Meacham describes a trap of somewhat different shape:

> 226 The Klamath mode of taking fish is peculiar to the Indians of this lake country. A canoe-shaped basket is made, with covering of willow work at each end, leaving a space of four feet in the middle top of the basket. This basket is carried out into the tules that adjoin the lakes, and sunk to the depth of two or three feet. The fishermen chew dried fish eggs and spit them in the water over the basket, until it is covered with the eggs, and then retire a short distance, waiting until the whitefish come in large numbers over the basket, when the fishermen cautiously approach the covered ends, and raise it suddenly, until the upper edge is above the water, and thus entrap hundreds of fish, that are about eight inches in length. These are transferred to the hands of the squaws, and by them are strung on ropes or sticks and placed over fires until cured, without salt, after which they are stored for winter use.[233]

114
122 search under a separate grant, and provided facilities for other students, Miss Deanne Rasmussen, who studied child-rearing practices, and Dr. and Mrs. Brian A. DuToit, who made a brief survey of the small community of Beatty, to amplify our observations in Chiloquin.

000 In addition to all of these, others who were carrying on studies at the same time provided many insights. Here may be mentioned Dr. and Mrs. Robert F. Spencer, Dr. William N. Fenton, and Dr. M. A. R. Barker. Similarly, my colleagues in the department of anthropology have been an unfailing source of stimulation. Among them, Drs. Luther Cressman, H. G. Barnett, and Vernon Dorjahn have made the greatest contribution. Drs. Cressman, Dorjahn, and Martin Schmitt, during my temporary absence from the country, undertook to oversee the drawing of several of the maps and the assembly of photographs.

128

127 Archival materials have come from several sources. I am indebted to officials of the Bancroft Library, University of California, Berkeley, for certain manuscripts in the Bancroft Collections; to the Robert H. Lowie Museum, of that University, for use of materials from the collection of C. Hart Merriam; to Dr. Thomas Vaughan and the Oregon Historical Society for use of the typescript copy of Joel Palmer's pocket diary; and to Martin Schmitt, Elizabeth Findley, and the Library of the University of Oregon for use of the Lindsay and O. C. Applegate Papers, and for many kindnesses.

The General Services Administration Records Center in Seattle provided archival materials from Klamath Agency reports, while the Portland Area Office of the Bureau of Indian Affairs, under Don C. Foster and Martin B. Holm, placed at our disposal many official files. Likewise, officials of the Klamath General Council and the Tribal Executive Committee gave us every courtesy and made available back files of tribal minutes. Finally, it would be remiss not to acknowledge the assistance given the study by the Klamath Management Specialists, the city officials of Chiloquin, and officers of Klamath County agencies.

000

128 Above all, the Klamath people and the residents of Chiloquin have provided us with the individual perspectives which here I have sought to place within a larger frame. Several have kindly read the resultant manuscript on Chiloquin and have suggested

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

157 One facet of Klamath guardedness and restraint is the general reluctance of
Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another character-
istic of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
657 the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
In the instance of Slim, for example, we find that a superficially adequate ad-
158 justment may simply be the manifestation of an obsessive control over and reduc-
[121] tion of emotional and intellectual processes to the point of a tentative diag-
nosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

analysis of 53 Klamath Rorschachs and 33 Thematic Apperception Tests, with additional evidence derived from participant observation and life history data (Clifton 1960). Moreover, the assessment agrees, in large part, with the observations and conclusions of other field workers working independently. The significant point is that Levine, working blind from records of persons he has never observed has reinforced and expanded upon previous evaluations of Klamath character. 128 [127]

A second hypothesis about the Klamath which arises from our study — an hypothesis of which we are less certain when compared with the observation that they are a people who may be viewed as guarded and restrained — is the finding that "in the total kin network the influence of the male is weak..." and "whether or not there is a male attached to the household group, the wife-mother is usually the power figure." This finding, based on the anthropological data, is theoretically congruent, almost startlingly so, with the fact that the more imaginative, creative, rich — healthy, if you will — Klamath Rorschach records were produced by the women in the sample, while the men's records were typically stereotyped and constricted, and often unrealistic, disorganized or suspicious. The statistical comparisons (Clifton 1960) as well as the individual Rorschach analysis (Chapter III) convey this impression very clearly. 121 157 562 [156] [127] [128]

The importance of these findings can be viewed profitably in the light of contemporary psychoanalytic theory, especially in relation to the concepts of identification and modeling in child development. The theory holds that the child identifies with, i.e., adapts the characteristics, attitudes, and values, of his parents because he envies them; they are the powerful people who receive the rewards and gratifications which he is denied. In classical psychoanalytic theory, the boy is said to identify with the father because the father is the power figure in the family and receives the love of the mother. Although Freud never was as content with his psychology of women as he was with the Oedipus Complex, presumably similar processes account for feminine psychology. The classical Oedipus Complex has been modified in order to integrate more satisfactorily with cross-cultural data, and it is in this more flexible framework that the present results can be understood best. 121 [128]

In those societies in which the father is not a stable, respected member of the family the process of identification is not as straightforward: the growing boy does not want to be like his weak father; he cannot identify with an absent father figure; yet he is biologically unable to be like his mother. The theory holds that his identification as a person will not be well integrated or complete. In the Klamath family, the mother is the stable figure, the one who commands the boy's respect. Since a consistent and integrated identification is needed for a healthy development of the ego, we are not surprised to find that the males in our Klamath sample show signs of poor ego structure. The women, on the other hand, come off much better and one may hypothesize that they are able to make a more integrated identification with the wife-mother figure in the Klamath family. 121 121 156 562 593

It may be necessary for a well-stated theoretical position to distinguish between two qualities of the parent which are confounded in the present discussion: stability of the model on the one hand and the extent to which the parent receives rewards, on the other. The general theoretical position, however, states that those societies in which the father is more stable, receives more of the respect and material reward, or is more powerful will be societies in which the boys can establish their roles more readily. On the other hand, in groups like the Klamath, in which the father is weak or absent, we can expect to see signs of role conflict, 121 121 156 562 593

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

802 171 The numeration system of a people is a relic of a remote age, and therefore of importance for tracing the ancient connections of tribes. The quinary system is the most frequent counting method in America, and often combines with the vigesimal. The pure quinary system prevails in Ara, in the Chimaríko, Yuki, and in the Shasti-Pit River family, in Sahaptin and Wayíletpu, and it is also the system found in Klamath. Curiously enough, the Maidu Indians count by fifteens, and the decimal system forms the basis [801] of the Wintún, Mutsun, and Selish dialects. The mystic or "sacred" number occurring hundreds of times in mythologic stories is *five* among all the Oregonian tribes.

197 To sum up the result of the above linguistic inquiry, it may be stated that our present knowledge does not allow us to connect the Klamath language genealogically with any of the other languages compared, but *that it stands as a linguistic family for itself.* It has adopted elements from the tongues spoken in its neighborhood; and a common element, chiefly pronominal, underlies several of these and the American languages in general.

THE HISTORIC PERIOD.

Ἐκ δὲ τοῦ καὶ πιστὰ πάντα κἄπιστα γίγνεται.

174 175 127 On account of the superstition previously alluded to, the traditional historic lore which forms so attractive a feature in the unwritten literature of the nations east of the Rocky Mountains and of Mexico is wanting entirely among the Máklaks, and we have to rely upon the meager reports of travelers and Government agents for accounts of the condition of the tribes in the earlier part of this century. Such notices of historic events are as follows:

000 According to a tradition recorded by Stephen Powers, an epidemic of small-pox broke out among the Modoc Indians in 1847, by which one hundred and fifty individuals perished.

The earliest historic conflict which can be ascertained with some chronological accuracy is the massacre of eighteen immigrants to Oregon by individuals of the Modoc tribe, and Ben Wright's massacre, consequent upon that bloody deed. The massacre of the immigrants occurred at a place on Tule or Rhett Lake, since called Bloody Point. Undoubtedly this was only

121 more useful dates and facts. Such results as these may be confidently looked for when several dialects of one linguistic family can be compared; and a careful comparison of one language with others spoken in the vicinity, belonging to the same or a different family, will always be attended with beneficial results for the increase of our scientific knowledge.

124 127 The aboriginal literary monuments printed below are authentic national records of a brave and industrious mountain tribe of Indians. Ethnologic notices have at a comparatively early period been gathered concerning the Modocs and Klamath Lake Indians, but most of them were of doubtful scientific value, because the information was gathered from them in the English language, which they understood but very imperfectly. Even now, the dates and facts recounted by them, as well as by Indians of many other tribes, in English, are so extremely confused, that only texts written in their own language can give us a clear insight into their traditions, myths, and mode of thinking.

538 No Indian tribe possesses a history of itself reaching back further than two or three generations, unless it has been recorded by whites at an early date, and what goes beyond this limit is tradition, on which we must be careful not to place any implicit reliance. But mythology records in a certain sense the intellectual history as well as the metaphysical ideas of a people, and thus by the gathering of the numerous mythic tales and legends of the Máklaks a start at least is made for the investigation of their intellectual development. A very moderate estimate puts at several hundred the more generally circulated myths of the Klamath Lake or É-ukshikni alone, and the number of their popular song-lines, so interesting and unique in many respects, may be called infinite, for their number is increased every day by new ones. The bulk of their mythic folklore is of great poetic beauty, freshness, and originality, and, like that of other tribes, full of childlike "naïveté." This latter characteristic forms one of their greatest attractions, and the animal myths of every uncultured people will prove attractive, because they were invented for religious or poetic and not for [173] didactic purposes. To some of the myths given below we may confidently ascribe an antiquity of over three centuries, for their archaic terms

APPENDIX

KLAMATH PLACE NAMES WITH MAP

128

The accompanying map of place names has been largely adapted from 127•
Leslie Spier, "Klamath Ethnography" (University of California Publica- 103
tions in American Archaeology and Ethnology, vol. 30, 1930. The present 114
writer has checked and retranscribed most of Spier's forms: only seven [124]
of Spier's place names could not be obtained from the author's informants. No attempt was made to recheck Spier's supporting geographical and ethnographic data, however.

Ninety-two new place names have also been added to the map. Many of these are not settlements (as Spier specifies for his list), but are places used for food gathering, places named for some outstanding natural feature, places named after some mythological person or event, etc. The author has appended what descriptive material he could obtain to each new place name in the list.

Forty-five additional place names are not shown on the map but are 128
included in the Dictionary. These are either uncertain as to location or 103
are places not found within the limits of the map.

The map has been renumbered to accomodate the new place names, [127]
but Spier's original numbers are given after each entry for purposes of
comparison. It must be noted that geographical locations on the map are [124]
only approximate and in some cases quite hypothetical (e.g., where the informant could only recall that a given place was "about two or three miles over that way").

Forms are given in phonemics only and are translated wherever possible. The morphophonemic forms of these names are listed under "place names" in the English-Klamath section of the Dictionary, along with some indication of their morphemic content.

74. /ba·go·lsam bani·gis/ "Muledeer's-Wading-out."
75. /hiwwas/ "Spread-out-in-Water." A swampy island just offshore.
76. /toq̓asksi/ "Willow-Place."
77. /ya·s ksaw̓a·l̓s/ "Willow-on-the-End."
78. /qdayksi/ "Rock-Place." Spier 45.
79. /sohi·yagye·ks/ "Jumping-Over-for-Fun." Spier 46.
80. /ˀiwli·wa/ "On-the-Very-Edge." Spier 47.
81. /čalčal̓a·ks/. A spring near /diwi·ˀa·ks/.
82. /diwi·ˀa·ks/ "Little-Rapids-Place." Spier 48.
83. /wilwaldi/. A spring north of /gawammat/.
84. /gawammat/ "In-the-Spring." Spier 49.
85. /ditq̓aks/ "Boiling-out." Spier 50.
86. /ni·Laqs/ "Sunrise." A place near Barclay Springs.
87. /w̓awˀa·qk̓alamksi/ "Little-Ears-Place." A cove that has the shape of an ear.
88. /kalw̓a·l̓/ "Sharp-on-the-End." Spier 51.
89. /wq̓ol̓was/ "Knotted-in-Water." Buck Island; Spier 52.
90. /lam̓a·č/ "Round-Object-on-the-End." Spier 53.
91. /watanks/. A hill east of /lam̓a·č/.
92. /ˀiWLi/ "Is-Inside." A cove north of /ksonksi/.
93. /ksonksi/ "Grass-Place." Spier 54.
94. /wl̓i·č/. A hill north-east of Klamath Falls.
95. /mp̓aq̓wals/ "Dry-on-Top." A hill northeast of Klamath Falls.
96. /diwi·ˀa·ks/ "Little-Rapids-Place."
97. /ˀiWawn̓a/ "Propped-up-against." Spier 55.
98. /gitba·tanks/ "Poured-up-on-Shore." A narrow channel where the wind was reputed to blow the water back upstream.
99. /qday ginqis/ "Hole-Through-Rocks." A camping ground and a village site.

100. /ʔiWLaLLo·nʔa/ "All-along-the-Top." Klamath Falls; Spier 56. 103
101. /lalawq̓at/. 127
102. /č̓ews hollamnas/ "Yellowhammer-Flying-along-the-Side." 102
103. /weqwe·Las/ "Falling-Downhill." Spier 57. 133
104. /lewsi/ "Round-Object-in-Water-Place." A small hill.
105. /tan̓aq̓aksi/. Spier 58.
106. /ʔiWba·tanʔa/ "Right-up-against." Spier 59.
107. /woksalks/ "Wokas-Getting-Place." Spier 60.
108. /dekčanks/ "Netting-Place." Skillethandle Point; Spier 61.
109. /hesle·ks/ "Apparition-Place." A place where spirit-otters appear and swim around one's canoe.
110. /č̓ayankedi/ "Berry (sp.)-Place."
111. /njaqjaqk̓is/ "Ringing-Instrument." A large rock with a depression in it. When this depression was pounded with another rock, a wind arose.
112. /sesti tgaw̓a·l̓s/ "Shasta-Standing-on-the-End." Squaw Point; Spier 62.
113. /no·galks/ "Roasting-Place." Roots were roasted in pits here.
114. /č̓a·q̓y̓a·k ksalamnas/ "Little-Boy-Lying-on-the-Hillside."
115. /qe·Yqe·Y̓lant/ "Where-It-Is-Rough." A campsite.
116. /ʔawsmi/. Bare Island.
117. /č̓eqs dawals/ "Blackbird-Standing-on-Top."
118. /stakm̓a·č/ "Projecting-on-the-End." Eagle Point; Spier 43.
119. /qčo·lʔam n̓iwl̓aqs/ "Star's-Fall." A place on the beach near Eagle Point where a meteor fell. The informants reported that a glow was visible at the spot for some time afterwards.
120. /ge·lalks/ "Land-Place." Spier 42.
121. /čak lali·ks/ "Serviceberry-on-the-Bank." A serviceberry patch.
122. /q̓aji/. A small settlement.
123. /waq̓a·qksi/. Spier 41.
124. /wačksi/ "Horse-Place."

INTRODUCTION

The present study is based on information gathered among the Klamath for the University of California during two visits, each for a month, in 1925 and 1926. Klamath material culture was partly known from Barrett's description of his collection made twenty years ago. The immediate need appeared to be a study of their religion and social organization. Gatschet's account of The Klamath Indians published in 1890 contains many data on shamans' songs and allied topics, but it does not provide any systematic notion of their meaning. 114

The Klamath still live in their old home in southern Oregon, but their ancient culture exists only in their memories, save as the older people keep up domestic pursuits. Yet even middle-aged people have a very good knowledge of it. My elderly informants had all participated in the old life in their youth. These were Nancy Phillips, Pat Kane, and Coley Ball, all three about seventy, and Thomas Lang, about fifty-five. With the exception of Mrs. Phillips they gave information in English: in her case (the most valuable material) Mr. Lang and his son Delford acted as interpreters. 131 178 115

The social life of the Klamath is so much a thing of the past that only its formal aspects can now be recovered. An intimate picture is impossible. But to avoid a stilted expression I have written the account in the historical present. The description of material culture and economic life is not complete. It is still partly extant among the Klamath and well worth investigating. 128

In a final section I have attempted to place the Klamath in a setting of western cultures as a whole. This has been difficult because of the lack of comparative data from much of the northwest; further, only a fraction of the published accounts is available to me at this writing (in Norman, Oklahoma).

The phonetic scheme is the simpler system of the Phonetic Transcription of Indian Languages (Smithsonian Misc. Coll., 66, no. 6, 1916), modified as:

ä as in *A*llen, pronounced more like *E*llen.
ŋ as in si*ng*.
ᴇ indefinite, obscure vowel; very short duration.
ḳ very far back.
k̢ cerebral; tongue tip probably turned back as Gatschet states (the sequence kr also occurs).
g̢ cerebral; may be the same sound.

128 A number of observations were made by my Klamath informants on the cultural habits of Molala, Northern Paiute, Upland Takelma, Modoc, and Achomawi-Atsugewi. I have included these as they demonstrate the sort of resemblances and differences of interest to my informants, and also because so few data are in print concerning these peoples. They will be found on the pages indicated:

Molala, pp. 4, 9, 24, 41, 59, 107, 156, 194, 214, 215.
Northern Paiute, pp. 58, 79, 81, 86, 90, 106, 158, 188, 190.
Upland Takelma, pp. 4, 24, 28, 29, 32, 35, 58, 59, 71, 177, 217.
Modoc, pp. 41, 42, 58, 81, 120, 158, 164, 175, 178, 190.
Achomawi-Atsugewi, pp. 59, 79, 190, 194.

524 vided with notches at the narrow end in which the cord is tied. It is not ornamented.

The sling (ske'wic) is used only in sport. It is wholly of buckskin; a wide piece to which thongs are attached. One is provided with a loop to slip over the finger. This is an aboriginal device.

As a mere plaything hummingbirds (p'i'uas) are fashioned from the hard interior of the tule. These are hung up in the earth-lodge.

String figures or cat's cradles (sōpķō'ptculĕ'as, from ķ!ō'pte!a, little finger ?) are for amusement. Yet if played in winter the months will grow longer. Their number is legion. I was told of a few; the stolen baby, Tca'ķiaķ, sunrise, owl's nest, sick Coyote's knees, the girl who fetches water, a bundle of arrows, the abandoned boy who grows, and two coyotes who run from each other. The interesting feature of these figures is that they depict moving scenes; thus sick coyote sticks up his knees; the girl goes to fetch water crying ōmdja, ōmdja, water, until she spies an Indian when she cries maķlaks, human, and flees to the other hand to begin again. Three of the figures were recorded.

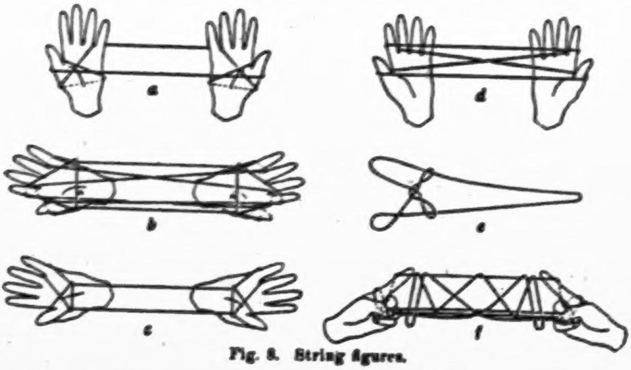

Fig. 8. String figures.

The figure of the stolen baby is called swĕnsowa'tķeas, taking from the cradle. Put each hand through the loop so that it lies on the back of each wrist. Lift the radial[131] string with each little finger from the ulnar side and the ulnar string from the radial side with each thumb, so as to form a loop on these four fingers (fig. 8a). Insert each

---

[114]
[128]

[131] Following the terminology of Rivers and Haddon (String Figures, 147) the thumb-side of the hand or finger is called radial, the little finger-side ulnar. Hence strings on these sides are called radial and ulnar strings. A loop near the butt end of a finger is proximal, near the tip distal. Loops may lie on the palmar or dorsal side of each finger.

index finger under the intersection on the opposite palm. Using the lips, lift the loop from the back of each wrist so that it rests in front of all the fingers (fig. 8*b*). With each index catch the strings at A and pull them through the loops on each index while allowing the latter to slip off the dorsal side of the index. This forms a horizontal rectangle at the center which represents the cradle. This is narrowed by bunching the fingers of each hand. A little stick is thrust through this with the lips; this is the baby. Let slip the loops from each index finger. Pull the hands apart and the stick will fly toward one of them. (The resulting figure is shown in fig. 8c.) The hands represent two Old [776] Women spirits (wlle'aḳak) fighting over the baby; the one who gets the stick wins.

A second figure forms Tca'ḳiaḳ, Little Boy spirit. The loop is placed over the right thumb and the left thumb and index finger. Hold both strings against the palm with the three other fingers of the left hand. Insert the right index under the loop over the left thumb and index from the dorsal proximal side (i.e., from the direction of the wrist). Release the strings held by the other fingers of the left hand. This gives figure 8*d*.[188] . . . . The final figure showing Tca'ḳiaḳ is given by figure 8*e*.

The third figure, sunrise (sa'basdIni'gi), is shown in figure 8*f*. Pulling the hands apart makes the middle loop stand as a triangular figure, representing the appearance of a mountain peak gradually emerging against the dawn. This construction is begun with the loop passing across the dorsal side of the left thumb and little finger and the palmar sides of the other three. Give the loop one complete twist (so that the ulnar string, e.g., of the left hand, is on the ulnar side at the right) and insert the thumb and little fingers of the right hand similarly. Pick up the palm loop of each hand from the proximal side with the opposite index. Hold the radial string on each index against the palm with the middle and ring fingers. Insert each index under the ulnar strings of each thumb from the proximal side, lifting the thumb loops off onto the indexes. Care must be taken to keep these loops at the tips of the indexes. Release the strings held by middle and ring fingers. With each thumb carry the radial string of the proximal loop on each index under (past the proximal side) the ulnar string on the little fingers. Bring back the thumb bearing a loop of this ulnar string. Slip little fingers out of the loops. (At this point my notes fail.)

---

[188] Unfortunately my field notes play me false: I cannot give the intermediate stages for either this or the following figure. [128]

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

539 What is coming out of my mouth? Black substance is hanging down from my mouth (158, 56).
What do I suck [bite] out? The disease I am sucking out[213] (155, 17).

I have recorded several songs the use of which I do not know. A shaman's song is about a mythical hero, Wawiwŏ'ķ!os, who is represented as singing.

ga'no wawi'awŏk
I am Wawiwŏ'ķ!os.

Nancy dreamed a song about the pole and pendant (wa"lasdŭ'pka) which stands before a shaman's earth-lodge.

wa" li'sasa nos nos
shaman's pole I I
nisowa'lis tu'ntani
shaman's pole hanging on.
I am the pole and the cord hangs from me.

[821] The rainbow is the spirit of Wile'aķaķ, Dwarf Old Woman. In a song she says that she swallows it like a sword.

wile'aķaķni	wile'aķaķni	stŏ'ngi	wi"teliŏķ
Dwarf Old Woman	something long	swallowed	rainbow

MISCELLANEOUS BELIEFS

128 In addition to omens and miscellaneous beliefs that have no proper place elsewhere in this account I have resuméd below all cases of beliefs which have their setting in the social and economic life of these people. I have not repeated here beliefs touched on in other parts of this section on shamanism.

763 The omens of death or disaster are varied. The thrush tells of an approaching enemy: wī'mpis ᴇgɛ'pkwa, they are coming. The horned owl also warns; mm, mm, mm, kŏkdᴇlŏ'n skiu'klu, who sent me? Or he predicts: ma'ķlaķs gᴇlĕķ gᴇlĕķ gᴇlĕķ, someone will die. Gatschet recorded similar constructions of the call of a crow, the howling of coyote or dog, a cat's mewing, or a hen's clamor just after sunset.[214] One may suggest that these associations are derived from the association of the sunset with the land of the dead which lies in the west. On the other hand the call of the loon at early dawn is a sign that someone will kill another. Yet this may really be a case in point, for then the general association would be with any night cry, since night is the time when the dead arise and roam.

---

[213] Chorus while the shaman bites and sucks the patient.

IV. THE KLAMATH AND WESTERN CULTURE

THE PLACE OF KLAMATH CULTURE

101 128 The place of the Klamath in western culture has been obscure and has, I think, been mistakenly appraised. In this section I have gone beyond the immediate task of defining it in order to build out on its northern border the synthesis of Californian cultures furnished by Kroeber.

101 114 Any attempt at placing the Klamath is rendered difficult by the paucity of information for large areas in the northwestern states. There is little enough on western Washington, but even less for the region east of the Cascade range, and practically nothing for the whole of Oregon. The southern Plateau is unknown save for the Nez Percé; its eastern section (Kutenai to Flathead) is another complete blank. Satisfactorily complete accounts now available can be numbered on the fingers: Gunther's Klallam, Haeberlin and Gunther's southern Puget Sound groups, Olson's manuscript notes on the Quinault, another manuscript on the Wishram by Sapir and the present writer, Teit's slight but highly suggestive notes on the Middle Columbia Salish, Spinden's Nez Percé, and the valuable collection of historical references gathered by Lewis. The situation is better for the Fraser river section of the Plateau, thanks to Teit's several accounts of the interior Salish. The stock of information on the Basin is slender and that for northern California none too voluminous. Nevertheless it seems possible to place the Klamath by a cautious use of these fragmentary data.

The present section will attempt to summarize the situation, with particular reference to material culture. The sections that follow analyze the shamanistic complex, social organization, and the girls' rites in greater detail.

*171 101 The food habits of the Klamath, and in fact their general material culture, places them squarely with the Plateau peoples. They are as much a river people as the Thompson, Lillooet, and Shuswap, although the river in their instance is a minor stream (the Williamson river) and substituted in part by flooded marshes. As a river people, their primary foodstuff is fish; vegetal foods, water-lily seed, roots, and the like, form a considerable part of their provender, yet a lesser one.

shaman who seeks to recover the soul of a sick man uses "a manikin 171* made of wood and cedar bark. When a conjurer wants to make use of 755 this manikin he gives it to a person who has no guardian spirit, who shakes it for him, and they two go to the country of the ghosts." 756 Boas states that this type of cure was derived by the Chinook from the Chehalis. Such sticks, carved and painted with reference to their guardians, and here described as manikins, are common property to those with spirit helpers from Oregon northward. When a Quinault shaman goes to cure, he is regularly accompanied by an aid who holds and rattles his carved stick. Here again illness is due to soul loss but there is no journey to the land of the dead.[485]

In quite another direction the Pomo appear with an assistant for the curing shaman. He shakes the shaman's rattle and sings his songs. As Kroeber remarks, the appearance of an assistant in this [114] quarter is unusual, and in the present state of our knowledge not connected by distribution with the instances cited above.[486]

One cannot escape the impression that this provision of a speaker for the shaman is linked with the chief's spokesman of many tribes of the west. The Northwest Coast type of spokesman is known as far south as the Wishram on the Columbia and perhaps in coastal Oregon. In the Basin, from eastern Washington to northern Arizona, there is word-for-word repetition of formal speeches. There is no chief's speaker in the intervening area from Wishram to Maidu, but there is for the shaman. When we realize that in this region, chiefs are socially eclipsed by shamans, we may well argue that a substitution has taken place. Objection may be made, however, that this is equally true in the Basin, where, so far as we know, shamans do not have speakers.

Accessory Elements

The distribution of analogues of the Klamath shamans' feats is 128 quite irregular, to judge by the few notes I have collected, but this is 756 undoubtedly due to incompleteness of information. Merely to put these on record, I present them here.

The Klamath shaman swallows fire; so does the Lillooet and 171* Thompson. Live coals are eaten by Quinault secret society performers, 756

---

[485] Boas, Doctrine of Souls, 40, Chinook Texts, 207; Olson, Quinault field notes, 1925.

[486] Handbook, 258.

selves the superiors of those among whom they are resident. Once the 171*
sentiment had become lodged in the group its fruition was made inev- 174
itable by the imitation of others. 583

With Kroeber, who has so expressed himself on the subject of the 554
Yurok,[559] I do not believe that the levirate and sororate were born of 556
this special development of purchase. Both customs have a nearly universal distribution in North America. It seems rather that such existing practices were drawn into the developing marriage complex of this area.

SOCIAL STRATIFICATION

The background for a study of social stratification has been laid 128 •
in the preceding section. I will here deal with chieftainship, its relations to wealth and heredity, and related topics.

Social stratification was but weakly developed among the Klamath. 554
Social standing did not depend directly on heredity and there was 556
apparently little difference in wealth from richest to poorest. Since wealth was inherited there was at least some stability to family standing. The marriage purchase gave respectability to the union; it did
not fix the standing of the couple by reason of the amount paid. Yet [56]
there was some differentiation based on wealth, a continuous gradation from the wealthiest to the slaves.

The wealthiest individuals were called lō'ki, rich men. This was 556
also the term by which chiefs were styled. My interpretation of the
Indian's statements is that those prominent individuals, who exer- 622
cised functions which would elsewhere have led to their being called chiefs, were at the same time the wealthiest. A chief became such primarily by successful leadership in war, coupled with some background of spirit power, wealth, personal qualities, especially ability as an advisor, with some suggestion of hereditary interest.

The chiefly functions emphasized were leadership in war and 622
haranguing the people. The chief could not issue injunctions, he re- [701]
ceived no tribute, and was in no way responsible for the conduct or debts of his people. Just prior to reservation days there was intro-
duced from Columbia river the practice of chiefs sitting as judges. [565]
While chiefs were set off from the mass, this did not imply any sense of caste stratification. Their wives and children were not known by a distinctive class term.

114
122 search under a separate grant, and provided facilities for other students, Miss Deanne Rasmussen, who studied child-rearing practices, and Dr. and Mrs. Brian A. DuToit, who made a brief survey of the small community of Beatty, to amplify our observations in Chiloquin.

000 In addition to all of these, others who were carrying on studies at the same time provided many insights. Here may be mentioned Dr. and Mrs. Robert F. Spencer, Dr. William N. Fenton, and Dr. M. A. R. Barker. Similarly, my colleagues in the department of anthropology have been an unfailing source 128 of stimulation. Among them, Drs. Luther Cressman, H. G. Barnett, and Vernon Dorjahn have made the greatest contribution. Drs. Cressman, Dorjahn, and Martin Schmitt, during my temporary absence from the country, undertook to oversee the drawing of several of the maps and the assembly of photographs.

127 Archival materials have come from several sources. I am indebted to officials of the Bancroft Library, University of California, Berkeley, for certain manuscripts in the Bancroft Collections; to the Robert H. Lowie Museum, of that University, for use of materials from the collection of C. Hart Merriam; to Dr. Thomas Vaughan and the Oregon Historical Society for use of the typescript copy of Joel Palmer's pocket diary; and to Martin Schmitt, Elizabeth Findley, and the Library of the University of Oregon for use of the Lindsay and O. C. Applegate Papers, and for many kindnesses.

The General Services Administration Records Center in Seattle provided archival materials from Klamath Agency reports, while the Portland Area Office of the Bureau of Indian Affairs, under Don C. Foster and Martin B. Holm, placed at our disposal many official files. Likewise, officials of the Klamath General Council and the Tribal Executive Committee gave us every courtesy and made available back files of tribal minutes. Finally, it would be 000 remiss not to acknowledge the assistance given the study by the Klamath Management Specialists, the city officials of Chiloquin, and officers of Klamath County agencies.

128 Above all, the Klamath people and the residents of Chiloquin have provided us with the individual perspectives which here I have sought to place within a larger frame. Several have kindly read the resultant manuscript on Chiloquin and have suggested

3:Stern E-4,5 (1949-1957) 1965 NR 10 Klamath NR 10

revisions of no small merit. They include the late William C. Lorenz and his wife, Claudia, Mr. and Mrs. LeRoy Gienger, Seldon Kirk and his daughter, Lelia, and Mr. and Mrs. Joe Ortis. 128

A quiet, though indispensible role has been played by my wife, and a number of her insights have found their way, unacknowledged, into these pages. 000

The Klamath research, through the years, has received support now gratefully acknowledged, from the Social Science Research Council, the American Council of Learned Societies, the Fund for the Republic, and the Faculty Research Program of the University of Oregon. 122 Two chapters of this volume have previously been published: Chapter Two appeared as "The Klamath Indians and the treaty of 1864," *Oregon Historical Quarterly,* 57 (1956 : 229-73; and Chapter Seventeen as "Livelihood and tribal government on the Klamath Indian reservation," *Human Organization,* 20 (1961-62): 172-80. They are reprinted here by permission. 128

KLAMATH CHILDHOOD AND EDUCATION[1]

By

MARION PEARSALL

INTRODUCTION

The communication of knowledge from one generation to another is a subtle process in any culture, and especially so among primitive groups with no clearly defined and well formulated educational system. Any study of primitive education is, therefore, difficult to demarcate. In its broadest sense, education might be defined as the formation of manners and habits by means of instruction, by both physical and moral discipline. The acquisition of all attitudes, knowledge, and skills can be included in education. A thorough investigation would have to answer the question of where, when, and how the individual acquires each item of his adult personality. 121

Obviously, no complete picture of education in any primitive group can be drawn after a single season in the field. The present study makes no pretense of being definitive. It is our intent to show the gradual development of the Klamath child from infancy to adulthood as he receives physical, religious, and moral training, as well as instruction in the food gathering techniques and skilled crafts of his culture. Undoubtedly many phases of the culture have been slighted, but we have tried to show in a general way the type of instruction and encouragement given the maturing child. 114 Klamath ethnography has been well known for years through the works of Gatschet (1890), Coville (1898, 1904), Dorsey (1901), Barrett (1910), Spier (1930), Voegelin (1942), and others. 128 For that reason, the details of language, material

[text continues on top of p. 339-B]

BIRTH AND INFANCY

Parenthood with its attendant responsibilities is not taken lightly by the average Klamath. 581 593 One gets married for the express purpose of raising a large family, and the couple with several strong sons and hardworking daughters is highly respected in the community. 842 A childless couple, on the other hand, is looked upon with contempt and pity. Barrenness is sometimes con-

---

[1] The present study is based on data collected for the University of California during a two-month stay on the Klamath Indian reservation in southern Oregon in the summer of 1947. Much of the material presented in this paper was gathered by Mrs. Betty T. Dasey, and the research represents our joint efforts. [122]

KLAMATH CHILDHOOD AND EDUCATION[1]

By

MARION PEARSALL

INTRODUCTION

128 culture, social and political organization are
not described here except in their effect on
124 education. Wherever particular items are mentioned,
we specifically asked our informants for
a description, even though they had been described
in previous ethnographies. Such accounts
may thus be taken as corroborating
earlier evidence unless otherwise specified in
the text.

131 The Klamath reside in their old territory
in southern Oregon, but the aboriginal way of
178 life has long since disappeared. Today they are
241 farmers and ranchers, but a considerable part of
the earlier culture remains alive in the memories
233 of a few oldsters. Our seven informants
(4 men and 3 women) were all in their late
178 seventies or eighties and had participated in
the last phases of the aboriginal culture as
115 children. It is regrettable that it was necessary
to reconstruct childhood training from the
reminiscences of elderly individuals. Doubtless
much of the material represents the ideal rather
than the actual pattern of education. The
ideals do, however, give a definite insight into
what was considered important in the upbringing
of children, whether these standards were always
maintained or not. Since there is little or
nothing in the early literature on this subject,
there is no way of comparing impressions received
from old people who are admittedly looking
back to "the good old days" with impressions
of objective eyewitnesses to the old ways as
they were really practiced.

BIRTH AND INFANCY

Barrenness is sometimes considered
cause for divorce. Since the blame
842 seems to fall most commonly on the woman, her
husband's parents may suggest that he send her
586 away and get a wife who can provide him with
children. Ordinarily, though, the parents-in-
606 law are more lenient with a barren woman.
Most Klamath express a preference for boys. A
842 variety of reasons are offered, the most common
being that boys are less bother than girls.
"Girls are always getting into trouble, and you
just raise them for someone else because they go
off to their husbands when they get married."
Once the child is born, however, there seems to
be no special favoritism shown to boys. One

M
K situated about upper Klamath Lake and in the mountains to the
101 east; except for a part of the Modoc in Oklahoma. It is the
131 object of the present paper to discuss briefly the conditions of
M aboriginal life among these people, due consideration being given
K their natural environment and the influence of surrounding
128 peoples upon them.

TERRITORY.

M The territory occupied by the Klamath Lake and Modoc
K Indians lies chiefly in the drainage basins of Upper and Lower
101 Klamath lakes and Tule or Rhett lake. From a point near the
131 confluence of Keen creek with Klamath river the western boundary
of their territory probably extended along the watershed
separating the Klamath lake and Rogue river drainages, to the
K foothills of the mountain in which Crater lake is situated. It
823 should be noted, however, that the Klamath, while they feared
Crater lake, did go upon certain occasions to the lake and seem
not to have been molested there by other Indians. It would seem
that the lake was looked upon as a sort of territory of mutual
rights by the peoples in its vicinity. They visited it when they
desired to acquire great merit in hunting or other pursuits in
which supernatural power was necessary. To go and bathe in
this wonderful lake was a brave thing to do, and made a man
lucky for hunting or other similar pursuits and made him very
K strong for war. It would appear that the relations formerly
131 existing between the Klamath and the people of the Rogue river
648 drainage were not at all friendly, so that the Klamath seldom
ventured as far west as the crest of the range. They did on
occasion make up large parties and go up to the crest of the
range for the purpose of hunting, but small parties rarely ventured
so far. The region for some distance to the west and
northwest of Crater lake was also visited by the Klamath for the
purpose of gathering berries in season.

K
101 On the north the boundary extended as far as to the headwaters
131 of Deschutes river, thus including the whole drainage
133 basin of Klamath marsh.[1] On the east the boundary probably

---

[101] [1] The Bureau of Ethnology's map in Bulletin 30 gives to the Lutuami
[114] territory as far north in the Deschutes drainage as latitude 44. See also volume I of this Bulletin, 779, 1907.

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it became
[154] apparent that a particular style of personal adjustment was by no means
characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to
characterize the confused orientations, the value conflicts, and the disorganized
family life of persons early in their life arc, but the same persons frequently
settled down to a respectable, stable "Elite Acculturated" mode of existence
in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
123 many refusals among the samples. That such a reaction might reflect important
variables and hence prejudice the reliability of the consequent approach was
considered, but it was apparent that the major cause for refusal was the absence
of an existing friendship relation between subjects and field-worker
(or some influential intermediary). Moreover, an analysis of the status of those
who refused indicated that this reaction was neither confined to nor clustered
within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a deliberately
representative sample of the reservation population. The criteria of
representativeness included variations in social roles assumed by the subjects
(occupation, sex, leadership, and so on), variations in role performance, differences
[123] in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently,
approached through the recommendations and aid of an intermediary, or, finally,
a direct effort was made to become acquainted with a suitable subject. In all
instances, an existing friend relationship proved the more successful mode of
approach. For reasons to be suggested in the next section, there are few Klamath
persons whose influence is both high and extensive, and, conversely, few who
[123] can easily accept external imposition of controls. Thus intermediaries, whatever
their manifest status, rarely could elicit the cooperation of more than one
suitable subject. The result of this effort was a set of Rorschach and Thematic
Apperception Test Records, and short life-histories on a sample of fifty four
persons, which sample could for the purposes of the research be considered as
●[128] reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety
as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there
is another aspect of the field method used in the Klamath study which may be of
[123] some interest. In each instance the potential subject was made aware of the intentions
of the field worker and the purposes of testing and interviewing. It
[181] will be clear from the next section that the contemporary Klamath are in no relevant
sense "primitive," nor are they an isolated population. Indeed, many subjects
125 were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the
clouds" or figures in rock formations. Further, most Klamath under fifty years
of age are sufficiently experienced in the practices of American culture to
have some personal familiarity with the "test situation," whether personality,
aptitude, vocational, or intelligence. Thus there was a shared basis for this
peculiar form of interaction.

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common
experience and status as Indian in contrast to White, the contemporary Klamath 101
may be considered as one people. This section consists of a sketch of today's 177
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 13
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological
aspects of these water courses were essential to the aboriginal Klamath economy, [184]
as they are essential to the recreational hunting and fishing of the present [224]
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly 648
White culture. For nearly a century they have maintained multiple loyalties:
to the Agency, which represents the Government, to the Tribe, which was an artificial
construct and has seldom been a viable corporate group, to the local [829]
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet 178
in the same years the Klamath have also acquired and learned much, and it would
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-residence
with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White
men of the Klamath. Instead, there has developed a variant socio-cultural [181]
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been transferred 648
to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber industry
has been the mainstay of the local economy, but relatively few Klamath have [511]
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

121 125 114

Piotrowski's stress on analyzing the percept, rather than the verbalized response (hence, perceptanalysis) is an example of his emphasis on a careful scrutiny of the manner in which *the subject* is approaching the task presented by the Rorschach examination. The errors resulting from a too hasty reliance on the subject's verbal report range from assuming the response "bat" to Card I is a W, when it might have been a rare detail to scoring an F- for any statistically infrequent response when a careful inquiry might have revealed an accurate, original, and well-organized percept. Ultimately, of course, we are dependent on the subject to tell us what he sees and how he is seeing it, but a sensitive, careful inquiry can help the subject communicate in words the images he has created. When our goal is an understanding of the adjustment of an individual Klamath, this attempt to see the blot as the subject sees it enables us to approach — with empathy, if you will — the subject's own manner of perceiving the blot stimulus.

However, Piotrowski's method of interpretation rests on firmer footing than this perhaps vague statement that an attempt is made to empathize with the subject. Piotrowski has stated, in explicit principles and definitions, the interpretive significance which he attaches to the various kinds of responses. Although these principles were used as guidelines, they were not adhered to in a dogmatic fashion.

125 128•

For example, the Rorschachs were scored carefully, but not rigidly. An illustration of this distinction is the scoring of form level. Much has been written about this pseudo-problem; the Beck-Klopfer controversy concerning a statistical versus an evaluative basis for form-level scoring has generated much heat. The present approach may seem at first blush to beg the question, but a moment's analysis indicates that the scoring is always done keeping in mind that the ultimate purpose of the test is interpretation. Thus, if a response is clearly an F+ response, i.e., the form of the image corresponds without question to the blot area, there is no scoring difficulty. However, if the subject gives a response which is neither clearly F+ nor F- (and for Beck, is statistically infrequent), but rather gives a response which might almost be justified, but not quite, the scorer need not sit in a quandary; to my way of thinking he need indicate merely that the subject has produced a response with this kind of borderline form level. (More detailed analyses of various approaches to form level have been described by Phillips & Smith, 1954; Klopfer, 1954). If the subject produces this kind of response often, we conclude that he often responds to life in a manner which does not include a careful evaluation of the situation, but that he does not behave in an obviously idiosyncratic manner. More precise interpretations may be formulated in the specific instance, of course. Piotrowski's scoring F± for vague responses such as "clouds," "rocks," or "bays," is an example of his attempt to formalize this approach to scoring borderline responses.

121 125 [128]

As a corollary to the emphasis on Ego interpretations, an attempt was made to evaluate the adequacy of the subjects' adjustment, and in the attempt, to uncover the person's strengths and assets, as well as his flaws and weaknesses. The task consisted, in part, of gauging the extent to which his particular adaptive mechanisms enable him to cope adequately with his impulses and feelings in the context of his environment — to what extent his life style meshed satisfactorily with his life space. Since the Rorschachs were interpreted by the psychologist initially without information concerning the subject's life history, this entailed a careful examination of the balance of components in the protocols themselves. In this process much emphasis was placed on the organizational quality of the responses. The research on genetic-level scoring of the Rorschach

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all aspects of the preceding case studies we intend to pursue some of the implications of certain striking characteristics of Klamath personalities. Aside from this descriptive effort we also intend to derive, hypothetically, an association between these personality attributes and Klamath acculturation experiences. 121

Certainly the most pervasively shared attribute of Klamath personalities is the one we have chosen to call guarded restraint. This label is intended to designate the general attitude towards self and interpersonal relationships which has emerged from the analysis of Rorschach records, life-history materials, and observations of behavior. Guarded restraint, therefore, may be taken to mean the prevalent suspicious and guarded attitude towards life of the Klamath subjects, their wariness as regards significant others, and their apprehensions as regards their environment generally. This attribute, as we conceive it, has many facets. It includes an unconscious as well as a more deliberate muting of responsiveness to the actions and the mere presence of others, a shallow, non-committal attitude towards membership in various social groups and the goals of these groups, and a characteristic which ranges from simple lack of trust to outright fear of the behavioral milieu. 156 157 [12]

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem somewhat ambiguous. The empirical referents on the level of observable behavior are, however, highly visible. They may be observed in a wide variety of behavior settings, from the informal and unstructured relations within a teenage clique or an adult drinking group to the more organized setting of the family and household. 121

The psycho-cultural phenomena we have labeled as guarded restraint over-laps with what others have called Klamath individualism. Seen in this perspective, we may, perhaps, introduce a somewhat richer way of analyzing and gaining insight into the nuances of Klamath behavioral styles. This approach is, we hope, something more than just a different way of looking at the manifest separatism and incohesiveness of family groups, a more fruitful manner of examining the atomistic structure of Klamath reservation sodalities, and a means of appreciating the psycho-dynamic causation of the constant fractionation of Klamath political groupings. The evidence of these case studies, then, suggests that few Klamath are capable of fully identifying with other persons or of committing their loyalties to concerted group action. 121 157 [156]

We feel that this major descriptive conclusion is, in large part, a product of the case study method used in analyzing the Rorschachs. Moreover, it is our belief that this conclusion could not have been obtained from an analysis of a composite psychogram based on formal scores. As anyone who has ever read reports based upon the statistical or modal personality approach well knows, such reports are ridden with dynamic cliches and are largely sterile until filled out with examples of the qualitative features of individual records. In this report Levine has entirely discarded the lumping of group scores and concentrated upon an analysis of qualitative features of individual records buttressed and supported by the use of formal scores and relationships. The importance of this approach is shown by the fact that the reserve and guardedness that characterizes Klamath does not always show up in individual test records in the same form. Most frequently an important clue is had from the presence of restrained, watchful, wary figures in human and animal movement responses. Indeed, this type of movement 125 128 [157]

125
128 response provided some of the first clues as regards this important personality
attribute (Clifton 1960). But other test evidence, as well as life history and
[157] observational data, leads to the same conclusion, regardless of the presence or
absence of a restrained movement response.
[124]

157 One facet of Klamath guardedness and restraint is the general reluctance of
157 Klamath individuals to reveal or communicate to others their needs, wishes, in-
156 terests, or concerns. This may, in part, be seen as a function of suspicion,
of fearful concern with the possible reactions of others, but another character-
istic of Klamath persons may be associated with this reserve. The reference here
is to a general, overt, and conscious devaluation of the self. The Klamath sel-
[125] dom have much good and often much that is bad to say of themselves. Although
this characteristic is not directly manifested in the Rorschach records, these
records do indicate the presence of multiple and conflicting, or unacceptable
prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 The analysis so far points to a general isolation of Klamath individuals from
156 significant, durable human associations. Given the facts of Klamath reservation
culture we consider that this characteristic is probably adaptive, although it
155 might not seem so if measured against an ideal model of mental health based upon
65[the functioning of west European, urban, middle-class persons. Considering the
[171] realities of the Klamath situation, guarded restraint in itself may hardly be
considered as pathological. Yet so great a reserve and so extensive an insula-
[158] tion of the self from important human transactions may be a major source of stress
and may predispose Klamath individuals to variant forms of mental illnesses.

157 Several of the cases contained in this report provide evidence for this hypothesis.
In the instance of Slim, for example, we find that a superficially adequate ad-
158 justment may simply be the manifestation of an obsessive control over and reduc-
[121] tion of emotional and intellectual processes to the point of a tentative diag-
nosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 The validity of this assessment does not depend upon these ten case studies alone.
127 Very similar if more limited conclusions were obtained in a previous, independent

analysis of 53 Klamath Rorschachs and 33 Thematic Apperception Tests, with 128
additional evidence derived from participant observation and life history data [127]
(Clifton 1960). Moreover, the assessment agrees, in large part, with the ob-
servations and conclusions of other field workers working independently. The
significant point is that Levine, working blind from records of persons he has
never observed has reinforced and expanded upon previous evaluations of Klamath
character.

A second hypothesis about the Klamath which arises from our study — an hypothesis 121
of which we are less certain when compared with the observation that they are
a people who may be viewed as guarded and restrained — is the finding that "in 157
the total kin network the influence of the male is weak..." and "whether or not 562
there is a male attached to the household group, the wife-mother is usually the
power figure." This finding, based on the anthropological data, is theoreti- [156]
cally congruent, almost startlingly so, with the fact that the more imaginative,
creative, rich — healthy, if you will — Klamath Rorschach records were produced
by the women in the sample, while the men's records were typically stereotyped
and constricted, and often unrealistic, disorganized or suspicious. The statis- [127]
tical comparisons (Clifton 1960) as well as the individual Rorschach analysis
(Chapter III) convey this impression very clearly. [128]

The importance of these findings can be viewed profitably in the light of con- 121
temporary psychoanalytic theory, especially in relation to the concepts of iden-
tification and modeling in child development. The theory holds that the child
identifies with, i.e., adapts the characteristics, attitudes, and values, of his
parents because he envies them; they are the powerful people who receive the
rewards and gratifications which he is denied. In classical psychoanalytic theory,
the boy is said to identify with the father because the father is the power figure
in the family and receives the love of the mother. Although Freud never was as
content with his psychology of women as he was with the Oedipus Complex, pre-
sumably similar processes account for feminine psychology. The classical Oedipus [128]
Complex has been modified in order to integrate more satisfactorily with cross-
cultural data, and it is in this more flexible framework that the present re-
sults can be understood best.

In those societies in which the father is not a stable, respected member of the 121
family the process of identification is not as straightforward: the growing boy
does not want to be like his weak father; he cannot identify with an absent
father figure; yet he is biologically unable to be like his mother. The theory
holds that his identification as a person will not be well integrated or complete.
In the Klamath family, the mother is the stable figure, the one who commands the 121
boy's respect. Since a consistent and integrated identification is needed for a
healthy development of the ego, we are not surprised to find that the males in 156
our Klamath sample show signs of poor ego structure. The women, on the other 562
hand, come off much better and one may hypothesize that they are able to make a 593
more integrated identification with the wife-mother figure in the Klamath family.

It may be necessary for a well-stated theoretical position to distinguish between 121
two qualities of the parent which are confounded in the present discussion: sta-
bility of the model on the one hand and the extent to which the parent receives
rewards, on the other. The general theoretical position, however, states that
those societies in which the father is more stable, receives more of the respect
and material reward, or is more powerful will be societies in which the boys can
establish their roles more readily. On the other hand, in groups like the Klamath, 121
in which the father is weak or absent, we can expect to see signs of role conflict, 156

LETTER OF TRANSMITTAL.

Smithsonian Institution,
Bureau of Ethnology,
Washington, D. C., June 25, 1890.

121 Sir: I have the honor to transmit to you my report upon the Klamath
Indians of Southwestern Oregon, the result of long and patient study. It
deals with their beliefs, legends, and traditions, their government and social
life, their racial and somatic peculiarities, and, more extensively, with their
126 language. To this the reader is introduced by numerous ethnographic
124 "Texts," suggested or dictated by the Indians themselves, and accompanied
by an interlinear translation and by "Notes," a method which I regard as
the most efficient means of becoming acquainted with any language. In
121 this report I have given prominence to the exposition of the language,
129 because I consider language to be the most important monument of the
American Indian. Archæology and ethnography are more apt to acquaint
us with *facts* concerning the aborigines, but language, when properly investigated, gives us the *ideas* that were moving the Indian's mind, not only
recently but long before the historic period.

Repeated and prolonged visits to the people of the northern as well as
of the southern chieftaincy have yielded sufficient material to enable me to
classify the language of both united tribes as belonging to a distinct family.
101 In their territorial seclusion from the nearer Indian tribes they show anthropologic differences considerable enough to justify us in regarding them as
a separate nationality.

197. There is probably no language spoken in North America possessed
of a nominal inflection more developed than the Klamath, although in
this particular, in the phonetic elements and in the syllabic reduplication
pervading all parts of speech, it shows many analogies with the Sahaptin

197 dialects. The analytic character of the language and its synthetic character balance each other pretty evenly, much as they do in the two classic languages of antiquity.

128 Concerning the ethnography of both chieftaincies and the mythology of the Modoc Indians, I have gathered more material than could be utilized for the report, and I hope to publish it at a later day as a necessary supplement to what is now embodied in the two parts of the present volume.

Very respectfully, yours,

Albert S. Gatschet.

Hon. J. W. Powell,
Director of the Bureau of Ethnology.

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

By Albert S. Gatschet.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

● 128 The topography of these highlands, which contain the headwaters of the
Klamath River of California, will be discussed at length after a mention of
the scanty literature existing upon this comparatively little explored tract of
land.

773 times over them or by blowing at them, an act which is supposed to impart
776 life.

CONCLUDING WORDS.

● 128 The limited space allowed for this ethnographic sketch forces me to
suppress the larger part of the matter for the present and to relegate it to a
future volume. A few points characteristic of the two tribes may, however,
be added on the last page of this Report.

614 The Klamath Indians are absolutely ignorant of the gentile or clan
171 system as prevalent among the Haida, Tlingit, and the Eastern Indians of
582 North America. Matriarchate is also unknown among them; every one is
free to marry within or without the tribe, and the children inherit from the
595 father. Although polygamy is now abolished, the marriage tie is a rather
581 loose one. This tribe is the southernmost one of those that flatten their
304 infants' skulls, this practice continuing about one year only after birth.

764 Cremation of the dead has been abolished since 1868, though during
the Modoc war these Indians burned several of their dead. The custom of
suppressing the personal names of the dead is rigidly kept up at the present
178 time. Art never had any encouragement or votaries among the Klamaths,
769 and the only objects seen that could be regarded as art products were a
531 few rock paintings and a head-board on a grave near the Agency buildings,
532 which was painted in the Haida style and represented a human face
flattened out to the right and left. Some baskets are artistically formed.
285 As there is no clay to be found on or near the reservation, pottery could
323 never become an art among these Indians. Their songs and poetry are also
artless, but nevertheless instructive, and several songs have beautiful tunes
533 that should be preserved. The musical and sonorous character of the language
538 fits it well for poetic composition; but a national poetry, to be of
success, would not have to adopt the rhyme as a metrical factor. Alliteration,
assonance, or the prosody of the ancients would be more suitable to
this upland language, with its arsis and thesis, than the artificial schemes
which poets are devising for the modern European tongues. Who will be
the first to teach the Muses the Klamath language?

115 she has succeeded in acquiring more mental training than Indians usually acquire on reservations.

4. *Charles Preston*, a pure-blood Klamath Lake Indian, born about 1840, is now stationed as interpreter at the subagency of Yaíneks. Preston had previously sojourned five years at Oregon City on the Willámet River and vicinity, and there he learned to converse in English quite fluently, acquiring also the idiom of the Wasco Indians, of which he has furnished me over three hundred of the most usual terms. During a stay of three weeks which he made at the Klamath Lake Agency, I obtained from him valuable grammatic and lexical information, texts, popular songs, and proper names, and revised with him the Modoc dictionary.

5. *Sergeant Morgan*, a pure-blood Indian, living at Koháshti, born about 1830, and jocosely called "*Sergeant*" on account of his wearing an old sergeant's uniform which he had obtained from soldiers at Fort Klamath. From this good-natured, intelligent old Indian I obtained a few short texts and some ethnologic information especially relating to mythologic and shamanic subjects.

6. "*The Captain*" or "*Captain Jim*", a pure-blood Indian, living at the junction of Sprague and Williamson Rivers, about five miles from the Agency buildings. When I saw him he was about fifty years old, and as he spoke but Klamath and Chinook jargon, all the mythology which he remembered was obtained through Minnie Froben. He received his nickname "*Captain*" from having been a help on a steamboat plying on the Willámet River, Oregon.

7–11. Other informants of whose assistance I have availed myself are mentioned at the head of the texts. They were *Johnson*, the head chief of the Modocs at Yaíneks; the conjurer *Kákash* or *Doctor John*; and several young Indians then scarcely over twenty-five years of age: *Pete*, *Frank*, and *Long John's Ben*. All of them are pure-blood Indians.

128 To facilitate the study of the Klamath language, and to increase the popular interest in the acquisition of Indian languages in general, I have inserted with the texts an interlinear translation, and subjoined to them a variety of commenting notes of linguistic, ethnographic, and historic import. The large majority of the Indian words could be rendered in their literal meaning; but in some instances, where literal translation was nearly

128 impossible, the *sense* of the word or phrase was reproduced as faithfully as could be done within the narrow space allotted. Words in brackets were inserted only to render the sentence complete.

But to the student striving after a thorough understanding of the texts all these helps will prove of partial assistance only. A thorough study of the Grammar ought in fact to precede their perusal, and reference to all the three portions of the work will frequently be necessary.

The material portion of a language can be faithfully conveyed to our understanding only by the correct pronunciation of its words, sentences [194] or texts. Hence all that is said of Klamath *phonetics* must be studied first, and more especially the alternating processes, the proclisis and enclisis, the sounds not occurring in English (as the linguals, the aspirate χ, the vowel ü), and first of all the pronouncing list of alphabetic sounds, which is subjoined. To initiate readers into the distinction, empirically obtained from the mouths of the natives, between the clear vowels *a*, *e*, *i*, *u*, and the dumb or deep-sounding *á*, *é*, *í*, *ú*, the earlier pages of the texts contain more indications than are given in the later. In certain terms long vowels can turn into short, and short into long ones. Special attention must be paid also to the study of elisions, apocopes, metatheses, etc.

[193] In the *morphologic* part of the Grammar, the verbal and nominal paradigms are particularly recommended to the student's attention, and a previous knowledge of the mode of forming the distributive reduplication from the absolute form is indispensable to the reader of my Texts, not only for their full comprehension, but even for the use of the Dictionary. The suffix of the future tense is written *-uapka*, to distinguish it from a homonymous form *-wapka*, of different signification. The apocopes occurring in the conversational style of language will soon be recognized as such by the reader; for example, *-tk* for *-tko*, *-ks* for *-kshi*, dropping of *-a*, *-ash*, etc.

To make the study of the Texts too easy by a flood of notes would be as obnoxious to the true interests of science, as to present unsolved too heavy grammatic difficulties to intellects yet untrained in the modes of Indian speech. Scholars may decide to what degree I have succeeded in avoiding both extremes.

NOTES.

[128] My efforts towards obtaining exhaustive texts from the natives concerning their belief in the transmigration of human souls were not crowned with entire success. Of the two items obtained, No. II is intended as a commentary of No. I, both treating [262] of the presence of human souls in fish. The cause why so many Indian tribes shun the flesh of certain fish lies in the fact that these species were seen feeding upon the bodies of drowned men and swimming around them. This induced the belief that man's soul will pass into the organisms of these finny inhabitants of the wave, even ×539 775 787 192 when death has resulted from other causes than from drowning. According to Hill, the Mák̲laks believe that the souls or spirits of the deceased pass into the bodies of living fish; they become inseparably connected with the fish's body and therefore cannot be perceived by Indians under usual circumstances. But in *one* status only they become visible to them; when Indians are bewitched by the irresistible, magic spell of a conjurer or of a wicked genius. Then they enter into a tamánuash-dream, and when they see a dead person's spirit in such a dream, they are almost certain to [755] die from it. Only the intervention of the conjurer and of his song-medicine can save them from perishing; rigorous fasting and ascetic performances cannot be then dispensed with, and with all that no certitude of his final rescue is to be had.

[769] Here as elsewhere the pronouns hûk, húnkiash etc., are inserted instead of the unpronounceable name of the deceased, and mean: *dead person, spirit.*

129, 2. pil mák̲laks; only dead Indians, not dead white men, because during their life-time these did not believe in the skû'ks; this belief is a privilege of the Indians.

129, 2. Hushti'χak etc. This sentence runs as follows: Tchē'ktoks hushti'χa ak nish, hûk tchē'k nish síuksh shanahō'li, wakiánhua tchēk p'násh (or pû'sh) nû'sh shuíshaltki gíug shanahō'li: "if he (the bad genius) makes me only dream in that manner, then he intends either to kill me, or perhaps he wants me to keep the song-medicine [756] for myself." To keep the song-medicine, shuíshli, is to undergo fasts and ascetic performances under the supervision of some conjurer for an almost unlimited time, five years at least.

129, 3. 4. Hä'toks ni' shläát etc.: if I should see (the dead) while I am *awake.*

[193] 129, 4. Skû'ks-kiäm, a compound word, may be rendered by spirit-fish, letiferous fish.

130, 1. Kiä'm k̲'leká etc. The rather obscure sense of this statement may be made comprehensible by the following: "When fish are dead, they are dead forever; hence

NR10 Klamath NR10

FOREWORD

The Survey of California Indian Languages, Department of Linguistics, 114
University of California, Berkeley, was fortunate to have Mr. M. A. R. 12
Barker as one of its field workers during the summers of 1955, 1956, and 1957. He had come to us from the University of Washington where he had had good training under Professors Melville Jacobs and Fang-Kuei Li and, after a year's further training at the University of California, he chose Klamath as his field language. Having located some good informants living in Chiloquin, Oregon, he was able to make an intensive study of the language and to obtain full materials for a grammar, a set of texts, and a dictionary.

Since 1957 Barker has been connected with the Institute of Islamic 114
Studies, McGill University, Montreal, Canada, where he teaches Urdu, Arabic, and general linguistics. In the midst of these many other duties, 128
Barker has found time to write up and send to the Survey a series of Monographs on the Klamath language. The present work, Klamath Texts, was sent to us first, but after the morphemic analysis was complete and the dictionary had been prepared, he sent us a list of corrections which he wished to have inserted in the typescript of the Texts. Working under our direction, Mr. Haruo Aoki, advanced graduate student and research assistant in linguistics, has carefully incorporated the necessary corrections. A few other minor changes have been introduced by the Survey's unofficial editor. For the most part these were dictated by the necessity of presenting the Klamath materials in more than one volume—the typescript of the Dictionary alone is nearly a thousand pages long! The changes are as follows: (1) What was originally an appendix to the Dictionary, namely Klamath Place Names with Map, has been removed from that position and included as an appendix to the present, shorter volume, the Texts. (2) The first paragraph of the Introduction to the Texts has been rewritten to include the names of the Klamath informants for the texts, since these do not otherwise appear except in the Introduction to the Grammar. (3) Bibliographic references are given in full wherever needed, since the Bibliography does not appear in the present volume but is included with the Grammar.

FOREWORD

128 The plates contain prints of black and white negatives produced from Kodachrome slides taken by Barker. It was regrettably not possible to include pictures of all of Barker's informants; some of the slides had too many deep shadows to make satisfactory black and white copies.

Mary R. Haas

9: Barker L-5 (1955-1957) 1963
NR10 Klamath NR10

INTRODUCTION

114 The texts presented here were collected during the summers of 1955,
1956, and 1957 which were spent among the Klamath Indians at Chiloquin,
122 Oregon. The field work was carried out under the auspices of the Survey
of California Indian Languages, Department of Linguistics, University of
115 California, Berkeley. The narrators of the myth texts were Mr. Robert
David, Mrs. Pansy Ohles, and Mr. Grover Pompey; the ethnographic materials were obtained from the first two of these and from Mrs. Aggie Butler, Mrs. Grover Pompey, and Miss Irene Skellock.

126 Most of these texts were recorded directly on tape, but some were taken down first in dictated form and were taped later. Of the myths, only Texts 1 and 7 were not recorded on tape. Of the ethnographic materials, Texts 24, 25, 29, 30, 31, and 35 were dictated only.

[124] No really exhaustive attempt was made to obtain a complete collection of Klamath myth texts. Instead, the author aimed at a representative collection of materials, including myths told by several informants, autobiographical experiences, ethnographic texts, historical incidents, conversation, and also the responses to a series of elicitation pictures (Text 39). It was felt that these texts would provide, on the one hand, good illustrative material for further linguistic studies in Klamath, and, on the other hand, a representative sampling of myths and ethnographic material of interest to the folklorist and ethnologist.

114 The collections of Klamath myths so far published are limited to A. S. Gatschet's "The Klamath Indians of Southwestern Oregon (Contributions to North American Ethnology, vol. II, pts. 1 and 2, Washington, 1890) and some brief song and medicine texts in Leslie Spier's "Klamath Ethnography" (University of California Publications in American Archaeology and Ethnology, vol. 30, 1930). More recently, Dr. Theodore Stern of the University of Oregon has collected a large number of Klamath myths. The author understands that Dr. Spier also possesses a collection of myths. It is urgently hoped that both of these will be published in the near future.

128 The present collection is divided into two major parts: Myths, and
773 Ethnographic Texts. The former contains tales about the inhabitants of

128 the prehuman world, when everything spoke and had life (as Mrs. Ohles
773 put it). The primordial human inhabitants of this world (the /psewdiwa·s/)
[776] are only casually mentioned, and the main figures are the mighty culture-transformers Gmoḱaḿč, ćečte·sis, and Sqeĺaḿč. The last two may be alternate names for the same figure, and the informants translated both
128 freely as "Old Marten" or "Old Mink." These beings travel through the
776 world, meeting monsters and inimical beings and destroying them, teaching the /psewdiwa·s/ how to live, and aiding those in trouble. Texts 19 and 20 contain incidents involving hostile, powerful beings and modern humans. Text 21 seems to involve modern humans also, but may refer to the /psewdiwa·s/.

128 The second part of the Texts contains material on food-gathering, historical occurrences, ethnographic descriptions, autobiographical incidents, etc. Text 38 consists of a free conversation between two informants and the author.

The translation of these texts presented considerable difficulties. To render the Klamath morpheme by morpheme—or even word by word—is, of course, impossible. This necessitated the addition of whole new phrases, at times, in order fully to cover the Klamath meaning. An attempt was made to keep the Klamath phrase junctures (/,/, /./, etc.) intact, although this has sometimes produced sentences which are thoroughly un-English.

Some of the Klamath material has been translated with great freedom. This is particularly true of the series of particles (sentence-connectives, etc.). Such sequences as /čoy/, /čoy honk ʔat/, /čoy čik/, /čoy da·ta/, etc., have been rendered as "So," "And," "Then," "So then," "And then," "So now," etc. The full force of these elements cannot be rendered into English without making the English sentence unintelligible. Forms like /či honk/ (lit. "as it") and /naʔas gi/ (lit. "thus did, thus made") have been freely translated as "(he) said, says," since this is the nearest English parallel of their use in Klamath.

Material in the translations which did not seem entirely justified from the Klamath alone has been inserted into the English enclosed in [. . .].

Parentheses have been employed in the Klamath to enclose English interpolations, asides to the investigator, etc.

Quotation marks have been used with several distinct purposes: (1) to enclose direct speech—material quoted by the speaker as being the speech of another (there is nothing in the phonemics to indicate this, but it is done for clarity's sake); (2) to enclose words quoted from the other language (i.e., words from English used in the Klamath, and words from

128 Klamath in the English sections). "Quoted" here has the technical meaning of "occurring as an integral part of an utterance in Language A, while belonging to the phonological system of Language B." For example, /kant sa nen do· č̓osak "Smith River" ʔigatga./ "Those which they always went to get there on 'Smith River.'" Here "Smith River" followed the English phonological system entirely. Where borrowed words follow the Klamath system, they are quoted in Klamath phonemics but are marked in the translations by quotation marks. Thus, /ʔi·t sa hon gi./ "They 'eat' it."

The symbols '. . .' mark quoted material occurring within quotation marks, as described above.

Place names, proper names, names of unknown plants, etc. have usually been left in Klamath, though without quotation marks. Exceptions to this practice are made whenever the name is easily translatable, or whenever a place is well known to English readers. For example, /č̓asga·y/ "Weasel." /č̓a·sis/ "Skunk," /gi·was/ "Crater Lake."

The transcription is phonemic with the sole exception of juncture. The texts have been rewritten here in "slow speech" (i.e., with all of the morphophonemic junctures occurring as phonemic junctures). This has been done in order to facilitate morphological and syntactic analysis. Thus, /čoysongat/ "so they now" has been written out in its slow speech form: /čoy sa honk ʔat/. Between morphophonemic junctures, however, all material is written phonemically.

[P. 4 is blank]

here with her previous impersonal narrations and with the even less personal text styles of other informants, whose stories and ethnographic material were always given as objective verbal "essays." 124

Some time after the text was recorded and analyzed, the author felt the need of having the entire myth on tape, rather than half in notebook form and half on tape. Mrs. Ohles kindly agreed to begin the story over again and told it right up to the point where she had switched to the tape-recorder before. This second tape-recorded beginning is appended to the text and serves for a comparison between pen and notebook dictation and tape-recorded discourse. [126]

Mrs. Ohles felt that material irrelevant to the story should be stricken, since it made the story "incorrect." The author feels, however, that such side remarks illustrate Klamath conversational style and give insight into her attitudes toward the myths and towards other facets of semi-acculturated Klamath culture. This material is, therefore, reproduced within parentheses both in the Klamath text and in the translation. Her English remarks are conventionally spelled but otherwise unchanged. [128]

Introductory Note to Text 5

#539
114
124

This text, like Text 4 above, seems to be only a fragment of a much longer myth cycle. Gatschet's published collection[35] does not contain a story about Swa·ya, but Curtin's "Myths of the Modocs"[36] includes one myth about this character. It seems worthwhile to record Mrs. Ohles' version here in hopes that future work among the Klamaths will fill in the gaps.

[128] The text has been edited somewhat to delete false starts, hesitation forms, and irrelevant material. In one or two places forgotten material was added later at the time of translation.

5. The Story of Swa·ya

(Mrs. Pansy Ohles)

[36] Curtin, Jeremiah, Myths of the Modocs, Boston, 1912.

[124] [37] Mrs. Ohles later elaborated upon the action described here. Frog takes baby Swa·ya and places him upon a leaf (or some such thing—Mrs. Ohles was not certain just what) and lets him float down the river, then pulls him back in again by a cord. This soothes Swa·ya and puts him to sleep. She gradually extends the cord until he is completely out of sight. Then she jumps in and swims off with him.

PART TWO: ETHNOGRAPHIC TEXTS

Introductory Note to Text 22

"Wokas" is the generic term for the seed of the common pond lily (Nymphaea polysepala). In the old days much of the Klamath Marsh (estimated by some early writers at about 10,000 acres) was covered with these plants, and there were long, shallow bays filled with them on both sides of Klamath Lake. Much of Klamath economic life was concerned with the gathering, preparation, and cooking of this plant. 824 [133] [433]

It is not proposed here to give a complete description of the various processes involved in "wokas"-manufacture. Good explanations of this economic complex will be found in Coville,[69] Gatschet,[70] and Spier.[71] The following text (and the two shorter ones by Mrs. Pompey which come after it) are intended only to illustrate Klamath narrative style and to indicate those features of "wokas"-making which were salient in the view of the informants. 252 [114] [128]

22. Wokas Preparation

(Mrs. Aggie Butler)

539*
222

(1) Long ago the Indians used to gather wokas, with a canoe. (2) And standing up on it they gathered wokas. (3) They bent down to pull them off, that wokas. (4) And they pulled off only the good ones, and some were unripe. (5) And having punctured it [with a fingernail] they saw [whether it was ripe or not]. (6) And they picked the yellow ones. (7) On becoming ripe it looks good, big. (8) And having picked those only, they threw them on the canoe and went. (9) And some were termed "snont́apĺaqs." (10) And one was called "abokẃas." (11) It was ripe. (12) And they put them down [in the canoe] apart. 501

that Modoc said once. (28) They never forgot it, [their] doing thus, 539*
[their] killing the Indians wrongfully [lit. "badly"]. 173
(29) And I have only related little bits of it. (30) But I know a great 648
deal, but I am not telling all of it, however. (31)—How the Indians used [721]
to fight amongst themselves, always they fought even among themselves.
(32) Even among themselves they enslaved someone's child, and sold it. [567]
(33) That much is all I will tell. (34) I have nothing else to tell.

Introductory Note to Text 28

This text is a continuation of the foregoing by Mrs. Butler's sister. 124
Both are part of a recorded conversation about Klamath history in general, 128
and no particular attempt was made to formalize the texts into "stories." When Mrs. Butler had finished her historical narrative above, the topic turned to the Modoc War, and Miss Skellock began to discuss their father's role in that conflict. Rightfully, this text should include the remarks in English which led up to the Klamath portion, and also an explanation and continuation in English which follows it. Limitations of space require that these English parts be edited and abbreviated, however.

Introductory Remarks in English

"Our father was a scout in the Modoc War. He was with the white 539*
soldiers and went to those Lava Beds where the Modocs were." 726
648
173

28. Recollection of the Modoc War

(Miss Irene Skellock)

(1) My father went there, to the battleground. (2) And he was with the white men. (3) And he was a soldier—ah—a "scout." (4) And they were falling on both sides of him, soldiers. (5) And if they shot one, the soldier behind him marched up to the front. (6) However, they never shot him. (7) And he, however, was afraid of seeing (?) those Modoc Indians only. (8) So he lived in fear, thus they said, and some of those Klamath Indians who went with him, they also were afraid. (9) And that's all I'm going to tell [in Klamath].

[TEXT CONTINUED ON PAGE 143]

9: Barker L-5 (1955-1957) 1963
NR10 Klamath NR10

autobiographical incidents. The end of the tape arrived just as Mrs. Cowan was beginning to feel tired, and the conversation came to an abrupt end. 124

The tape has been considerably edited to remove false starts, English portions, fragmentary or unintelligible sections, and other such "noise." The author's questions were originally asked in broken Klamath, and this has been put into English in order not to give rise to mistaken statements about the language. As was done above, personal names have been omitted out of respect for the individuals involved. Utterances by different Klamath speakers are indicated by their initials, viz., AC, PO, and RC, and the author's utterances are marked by PB. 124 128

38. A Conversation (among several)

539*
124
[824]

(1) PO: Yes, little Coyote, on whom [Gmoḱaḿč] stuck those things—that we call cattails, which was the reason, his fur is bad.

PB: Do you know any myths?

(2) PO: Could you tell a myth to me? (3) I wonder if you would tell a myth?

(4) AC: I don't know how. I don't know how to tell myths.

(5) PO: Do you remember when the white men first came? (6) Do you remember that?

(7) AC: The girls [i.e., nurses] asked me there in the "hospital" thus, "How long have you lived, how long?" (8) So I said, "There were no white people here at all, when I travelled around here." [173]

(9) PO: How big were you, when the white men came? (10) How big were you, when the white men came—when you recall the white men coming for the first time. (11) How big?

(12) AC: Yes, I was big [i.e., "grown up"], big. (13) I know a lot. (14) I was big when they fought the war [i.e., the Modoc War], over there, across there. (15) I being big, I know a lot. (16) But there were no white people anywhere around here, there were none—thus I told those white people [i.e., the nurses]. (17) There were none. (18) Only we Indians were many around here, Klamath Falls people. (19) Many Indians' land this was, [I?] said. (20) "ʔo···," they said, "Yes..." (21) So I have lived so long, I said. (22) "You have lived a very long time," they said, "It was long ago, when there were no white people, long ago," they said to me, the girls there, from the "hospital."

[TEXT CONTINUED ON PAGE 159]

APPENDIX

KLAMATH PLACE NAMES WITH MAP

128

The accompanying map of place names has been largely adapted from 127
Leslie Spier, "Klamath Ethnography" (University of California Publica- 103
tions in American Archaeology and Ethnology, vol. 30, 1930. The present 114
writer has checked and retranscribed most of Spier's forms: only seven [124]
of Spier's place names could not be obtained from the author's informants. No attempt was made to recheck Spier's supporting geographical and ethnographic data, however.

Ninety-two new place names have also been added to the map. Many of these are not settlements (as Spier specifies for his list), but are places used for food gathering, places named for some outstanding natural feature, places named after some mythological person or event, etc. The author has appended what descriptive material he could obtain to each new place name in the list.

Forty-five additional place names are not shown on the map but are 12.8
included in the Dictionary. These are either uncertain as to location or 103
are places not found within the limits of the map.

The map has been renumbered to accomodate the new place names, [127]
but Spier's original numbers are given after each entry for purposes of
comparison. It must be noted that geographical locations on the map are [124]
only approximate and in some cases quite hypothetical (e.g., where the informant could only recall that a given place was "about two or three miles over that way").

Forms are given in phonemics only and are translated wherever possible. The morphophonemic forms of these names are listed under "place names" in the English-Klamath section of the Dictionary, along with some indication of their morphemic content.

M
K
101
131

end of Horse Fly valley and Lockey Flat, passing in the vicinity of Keno Spring, and thence westward through, or in the vicinity of. the village of Dairy. It passed a short distance north of Bale's lake and Olene and appears to have left the whole of Lost River valley in the territory of the Modoc. It passed either along the eastern shore of, or through, Lower Klamath lake. Further than this no definite information was obtained concerning this secondary boundary.

ENVIRONMENT.

M
K
• 13
[184]

The natural environment of the Lutuami, a high, mountainous and volcanic region, filled with lakes and marshes, influenced their culture in many ways. The two lakes, Upper Klamath and Tule or Rhett lake, formed the centers of population for the two divisions, the Klamath and the Modoc. Along the western shore of these lakes, and of Lower Klamath lake, as well as along the high plateau to the east of Upper Klamath lake, there were considerable forests of conifers which provided material for canoes and houses as well as a part of the food supply. In fact the whole western portion of the territory is well forested. The eastern part, however, notably about Yainax agency and eastward, is to a great extent a semi-desert, sage-brush country. In this eastern region there are many fertile valleys, as for instance, along Sprague and Sycan rivers, but on the whole the territory is by no means so desirable for habitation as that about Upper Klamath lake and Klamath marsh, where the soil is very rich and productive. The old fault line in which Upper and Lower Klamath lakes and Klamath marsh are situated has existed so long that a large area has silted in and formed a very fertile country, which provided in aboriginal times an abundance of various tubers, seeds, and other vegetable foods. Among the most important natural features of this region are the great tracts of marshy land. These marshes are covered constantly with water from a few inches to several feet in depth. In these, particularly in Klamath marsh, is found the staple article of food among the Klamath, and to a certain extent also among the Modoc, the yellow water-lily, *Nymphia polysepala.* Large areas of marsh are completely covered with this water-lily to the ex-

5: Barrett E-5 (1907) 1910
NR10 Klamath NR 10 ●
Modoc NS17

M clusion of almost everything else. The seeds of this plant,
K gathered and preserved in three different manners, as described
● 13 in detail by Coville,[*] form the staple article of food and thus
correspond to acorns used over the greater part of California.
About Tule or Rhett lake and the smaller lakes of that vicinity
there are fewer marshes and consequently a s[illegible]ler supply of
the water-lily. Thus the Modoc were much less abundantly supplied with this staple than were the Klamath, who are said to
have had on Klamath marsh alone over ten thousand acres of
these plants. The chief vegetable food of the Modoc seems to
have been tubers and bulbs, notably camass and ipos.

M The extensive lakes of this region naturally bring great num-
K bers of water birds of various kinds, including swans, geese,
136 ducks, and wading birds, the majority of which were used by the
Indians as food and in various ways. The skins of swans, geese,
and other birds with especially fine down, were made into
feather blankets, swaddling clothes, etc. Fish were abundant in
the lakes, salmon and salmon trout being especially esteemed by
M the Indians. The presence of this large supply of water birds
K and fish developed certain specialized implements for their cap-
223 ture. For taking birds there were what may be termed a ring-
M pointed arrow, and a special net. There were several methods
K of taking fish, the most important being by the large triangular
226 dip-net used in the dug-out canoe, as shown in pl. 10.

501 The country provided also an abundance of the usual animals,
M such as deer, elk, antelope, and others used for food; and coyotes,
K gray wolves, foxes, badgers, wildcats, rabbits, and various fur-
136 bearing animals furnishing blankets and clothing.
237

BUILDINGS.

M The houses of the Klamath and Modoc were of two kinds. In
K this region where the snow on the higher peaks is always in
342 sight, and where it often reaches a depth of several feet in winter,
[133] a warm and durable house is necessary. This was provided by
[132] the semi-subterranean earth lodge, which was of the usual central
California form, and had a pit from a foot to three or four feet

Section II. The Setting — Klamath Reservation Culture

The Klamath Reservation was established in 1864 by a treaty between the United 175
States Government and three separate groups, the Klamath, the Modoc, and the 648
Yahuskin Snake (Paiute). Because the differences which once divided these 657
original groups have disappeared in the face of acculturation and the common 101
experience and status as Indian in contrast to White, the contemporary Klamath 177
may be considered as one people. This section consists of a sketch of today's
reservation culture, and will necessarily have to exclude mention of the local 128
variant of American culture, although Whites form the largest share of the 162
reservation's population.

The reservation lies in what is known as the Klamath Basin, which is to say 657
between the eastern Cascades and the Basin Range. It contains the heart of 130
what used to be Klamath country, for Modoc and Paiute lands were lost in the
treaty stipulations. The reservation consists of alternating valleys and low
ridges, and has an average elevation of 4000 feet. Of the more than a million
acres of land within its boundaries, some 800,000 are covered with stands of
commercially valuable timber, Ponderosa Pine, Douglas Fir, and other lesser
species. The reservation also includes numerous lakes, marshes and streams, which
through tributaries eventually drain into the Klamath river. The ecological [184]
aspects of these water courses were essential to the aboriginal Klamath economy,
as they are essential to the recreational hunting and fishing of the present [224]
population, White or Klamath. [226]

Today the Klamath represent an unassimilated enclave living on what remains of 101
their own territory, but in the midst of and intermingled with a dominantly
White culture. For nearly a century they have maintained multiple loyalties: 648
to the Agency, which represents the Government, to the Tribe, which was an ar- [829]
tificial construct and has seldom been a viable corporate group, to the local
towns and communities, which afford them a special status, to their own kin groups,
whose functions and structure have changed drastically, and to the State, which [178]
now embraces them as citizens.

In the century or more of White contact and settlement the Klamath have lost 648
their former isolation, their traditional ways, and much of their land. Yet
in the same years the Klamath have also acquired and learned much, and it would 178
have been unaccountably strange had they not. The growth of mill and market
towns and of ranching and farming settlements, the development of the lumber
industry, the constant if irritating supervision and tutelage of the Agency,
the improvement of communications, the frequency of inter-marriage and co-resi-
dence with non-Klamath, their participation in public education facilities,
all of these and other experiences have given new directions to Klamath life,
so that today no Klamath lives a life remotely resembling that of his ancestors
of a century ago. Yet these years of contact and change have not made White
men of the Klamath. Instead, there has developed a variant socio-cultural [181]
system, Klamath Reservation Culture, which is neither aboriginal nor American
in design.

Although much of the agricultural resources of the reservation have been trans- 648
ferred to White ownership, a number of the contemporary Klamath are successful 423
farmers or ranchers. Others occupy homesteads on farm or ranch land but do not
utilize these resources. These latter homesteads are little more than rural [241]
slums, the scenes of perennial drinking parties. For decades the timber indus-
try has been the mainstay of the local economy, but relatively few Klamath have [511]
ever worked in that industry. Most Klamath live in one or another of the several [273]
[313]

(ca. 1860-1900) NR10 Klamath NR10

INTRODUCTION

The present study is based on information gathered among the 114 Klamath for the University of California during two visits, each for a month, in 1925 and 1926. Klamath material culture was partly known from Barrett's description of his collection made twenty years ago. The immediate need appeared to be a study of their religion and social organization. Gatschet's account of The Klamath Indians published in 1890 contains many data on shamans' songs and allied topics, but it does not provide any systematic notion of their meaning.

The Klamath still live in their old home in southern Oregon, but 131 their ancient culture exists only in their memories, save as the older 178 people keep up domestic pursuits. Yet even middle-aged people have a very good knowledge of it. My elderly informants had all participated in the old life in their youth. 115 These were Nancy Phillips, Pat Kane, and Coley Ball, all three about seventy, and Thomas Lang, about fifty-five. With the exception of Mrs. Phillips they gave information in English: in her case (the most valuable material) Mr. Lang and his son Delford acted as interpreters.

The social life of the Klamath is so much a thing of the past that 128 only its formal aspects can now be recovered. An intimate picture is impossible. But to avoid a stilted expression I have written the account in the historical present. The description of material culture and economic life is not complete. It is still partly extant among the Klamath and well worth investigating.

In a final section I have attempted to place the Klamath in a setting of western cultures as a whole. This has been difficult because of the lack of comparative data from much of the northwest; further, only a fraction of the published accounts is available to me at this writing (in Norman, Oklahoma).

The phonetic scheme is the simpler system of the Phonetic Transcription of Indian Languages (Smithsonian Misc. Coll., 66, no. 6, 1916), modified as:

ä as in *Allen*, pronounced more like *Ellen*.
ŋ as in si*ng*.
ᴇ indefinite, obscure vowel; very short duration.
ḳ very far back.
k cerebral; tongue tip probably turned back as Gatschet states (the sequence kr also occurs).
g cerebral; may be the same sound.

[p. vii]

The Klamath numbered 3000 in the historic period, the Modoc not so many. This is the testimony of Tom Lang, yet the number is much too large. Palmer[18] put their number at 415 in thirteen villages in 1854, but his list of villages indicates that he counted only the ä'ukckni (Klamath marsh) division. This would be about eighty-three families, a reasonable average of six houses to a settlement. At the time, however, the Klamath were said to be considerably reduced, and I was told of twenty-nine or more ä'ukckni settlements dating from this period, and said to be all occupied at the time. Yet, as no great epidemic was reported, it is doubtful that the population had been diminished by half. Possibly the occupation of the sites was more seasonal than I was told: a movement to Klamath marsh in summer, returning to the warmer Williamson valley in winter. Assuming a partial reduction and some fluctuating occupation, we may arbitrarily set the ä'ukckni at half as many again, say 600. The ä'ukckni settlements numbered half of the total and my informants' impression was that in population they were as many as all the other divisions together. This would mean that the Klamath as a whole numbered only 1200. Palmer's figure would give a mere 800, and the evidence of the settlements, a possible 2000. Our twelve hundred is not far from that of Kroeber, who set the combined Klamath and Modoc population at 2000, two-thirds of them being Klamath.[19] Mooney's estimate of 800 seems low.[20] 174 161

Early Contacts with the Whites

Contacts with the whites date back to 1825 or somewhat earlier. In 1826–27 Peter Ogden spent two months among the Klamath.[21] His first meeting with them seems to have been on Klamath marsh. 175

> Wednesday, 30th Nov. [1826]. Course south to Clammitt River [Klamath marsh?] 25 miles from River of the Falls [Deschutes]. Mr. McKay proceeded ahead to an Indian village distant 3 miles. It was composed of 20 tents built on the water approachable only by canoes, the tents built of large logs shaped like block houses the foundation stone or gravel made solid by piles sunk 6 ft. deep. Their tents are constantly guarded. They regretted we had opened a communication from the mountains. They said "The Nez Percés have made different attempts to reach our village but could not succeed. Even last summer we discovered a war party of Cayuse and Nez Percés in search of us; but they did not find us. Now they will have yr. road to follow. We have no fire arms. Still we fear them not. [131] [361] [342] [721]

[21] Elliott, Ogden Journals, 210.

Frémont also remarked on the scarcity of their horses.[22]

Frémont reached Klamath lake again May 6, 1846. He commented on the outlet, Link river, "this is a great fishing station for the Indians." His statement on the distribution of their settlements coincides with my information. [231] [226]

> They have fixed habitations around the shores of the lake, particularly at the outlet and inlet [Williamson river], and along the inlet up to the swamp meadow [Klamath marsh], where I met the Tlamaths in the winter of '43–'44, and where we narrowly escaped disaster. . . . . The Indians made me understand that there was another large river [Williamson river] which came from the north and flowed into the lake at the northern end, and that the principal village was at its mouth, where also they caught many fish. [361] [131] [133]

Frémont's party made a circuit of the lake. It is curious that he does not mention the settlements about Pelican lake on the western side, which he could hardly have avoided. On the other hand it is not clear how closely his memoirs follow his diary. Attacked while on the western side, his party reciprocated by raiding a village on the opposite side, perhaps one of those on Williamson river just above the present highway bridge. [726]

> Behind the sage-bushes where they had taken their stand every Indian had spread his arrows on the ground in fan-like shape, so that they would be ready to his hand. . . . . Quantities of fish were drying, spread on scaffolds, or hung up on frames. The huts, which were made of tall rushes and willows, like those on the savannah above [Klamath marsh], were set on fire, and the fish and scaffolds were all destroyed.[23] [252] [342] [726]

The first invaders remembered by the Klamath came from the north about 1835. The stories about them have now a legendary flavor. The first group was mounted; the Klamath dubbed them mpĕ'tkoks (from mĕtc!a', to pack about) from their roving habits. An alternative name, pásai'ŭks (French-Canadian in Chinook jargon), more surely identifies them. During their brief stay at the mouth of Williamson river they bought fat dogs of the Klamath, which to the latter's amazement, they ate. For these they gave buttons and metal disks with a central perforation (wika'lkal). 173 437 648

Almost as early was a white contingent moving northward on the west side of Klamath lake. The Indians watched them unseen. They were impressed with the horses, axes, and the food of the whites. 173 648 177

[23] Frémont, Memoirs, 483, 484, 494.

173 When the latter broke camp they left behind a little flour, which the
177 Indians carried home and divided. They rubbed it on their palms and
[302] smeared their faces.[24]

648 Other early whites came from the southeast on horseback. This
marked the beginning of the great migration by way of the Modoc
648 country to the Pacific slope. On the whole the Klamath came off remarkably well in their relations with the whites. The full brunt of immigration was borne by Modoc and Pit River peoples. The Klamath were spared the Oregon wars of the fifties, which all but annihilated the tribes of western Oregon and northern California.[25] The earliest white settlements in the neighborhood were about the present Jacksonville, Medford, and Ashland. The first white settlement within Klamath territory was near the village of kowa'edi at the northern end of the lake. This was about 1860–65, hence may have reference to the first agency established there. Subsequent relations have been on the whole quite amicable. The Klamath took no part in the Modoc war of 1872–73.

Habitat

131 The territory of the Klamath is on the high plateau of eastern
133 Oregon, in the shallow basin wherein lies the group of lakes that give rise to Klamath river. The southern half of this basin about lower Klamath and Tule lakes is Modoc territory, extending southward across the lava beds in the direction of Pit river. The northern half, which lies against the Cascade range, is the home of the Klamath.

The Klamath properly reside on Klamath lake (or as it was formerly known, upper or middle Klamath lake), on Klamath marsh,
[361] and on Williamson river, which connects them. At least, most of the permanent winter settlements are on these three waters, with a scattering on their tributaries. Summer camps are established over a much wider territory, as far, it would seem, as the natural limits of this drainage area.

---

[263] [24] Salt was equally unknown to them at this time.

[174] [648] [25] A somewhat obscure account was given me of the inclusion of Klamath in the great round-up of western Oregon Indians on Siletz (?) reservation in the fifties. These had been wintering at the Dalles and were herded with the Indians there. The Upland Takelma and Molala were penned in together and fed by the soldiers. Some died every day; the Klamath suspected that they were poisoned. The Klamath were kept apart, and, thanks to the strenuous arguments of their chief Lale'ks, were not only freed but supplied with beef and an escort of soldiery to conduct them back to their own country.

The western and southern limits of the range are easiest to define 101
because of the topography and the proximity of other tribes. To the 131
east and north the open deserts and broken country extend indefinitely. 133
The nearest of the shifting settlements of Northern Paiute on the east
at Goose and Summer lakes are sixty and more miles from Klamath
lake. Those of the Warm Springs tribes are one hundred and fifty
miles distant, more than halfway across Oregon. Teit's data show [175]
that more than a century ago the neighbors of the Klamath in this
direction were the Sahaptins at no great distance and beyond them
Molala and Cayuse.

The wide plain south of Klamath Falls seems to have been unoc- 101
cupied. The Modoc lived south of the Lost River hills about Tule lake
and on lower Klamath lake. My Klamath informant doubted that 131
they lived on Miller lake, or had permanent settlements on Lost river. 174
Both tribes congregated at one place only for the early spring fishing,
namely on Lost river, a mile or more below the buttes at Olene. The [226]
Klamath camp site is on the north bank, the Modoc on the south.

The southern boundary of Klamath territory skirts the Klamath 101
valley from this place as far downstream as Spencer creek, near the
California-Oregon line, below the canyon of the Klamath. Below this 131
on the river are the Shasta, whose northernmost outposts are on Shovel
creek and north of the river on Jennie creek. The Klamath have no [226]
settlements on the river, but fish, hunt, and gather roots at such points [224]
as Keno, Spencer creek (ma'lbuk̦'is), and at laik'ĕlmi, five or six miles [222]
upstream from Dorris (?).

The western boundary is the Cascade watershed, including, however, territory on the northwest side of Mount Pitt (Mount McLoughlin) and again southwest of Crater lake. The Klamath hunt northwest of this conspicuous mountain in a region of many streams called la'ndjli (possibly an American name). Fifteen miles southwest of Crater lake is Huckleberry mountain (iwumkă'ni, huckleberry place) where the Klamath meet the Molala similarly engaged in berry picking. The latter regularly occupy the highlands of the upper Rogue river drainage above Trail creek or some point below Prospect. These Molala form a southern extension of that tribe from the upper Umpqua drainage.

The northern and eastern boundaries are somewhat indefinite. Palmer stated:

101
131

> East of the Cascade mountains, and south of the 44th parallel, is a country not attached particularly to any agency. That portion at the eastern base of this range, extending twenty-five or thirty miles east, and south to the California line, is the country of the Klamath Indians.[36]

This is essentially correct although the boundary might better be set somewhat farther south to exclude the headwaters of the Deschutes, in earlier times the home of Sahaptin peoples. The country north of Klamath marsh is considered too open and cold for settlement. On the eastern border are a series of lakes (Silver, Summer, Abert, Goose) and rims which give on the desert to the east. There are Northern Paiute settlements on the eastern sides of Summer and Goose lakes, perhaps those of the Walpahpas mentioned by Meacham.

648

> The meeting with the Klamath and Snakes was one of interest to all parties, from the fact that they had been enemies, and the chiefs had not met in person since peace was restored. Living in the country intervening [presumably Summer to Goose lakes] was a small tribe of Wal-pah-pas, who are half Snake and half Klamath. They were mediators, though sometimes fighting on alternate sides, as interest or affront gave occasion.[37]

101
131
221

Sycan river, Sycan marsh, and Yamsay mountain are summer resorts of the Klamath, who had their easternmost settlement (hledleluë'luke) somewhere west of Gearhart mountain. Chewaucan marsh, between Summer and Abert lakes, was probably also visited, although I was not told so. Its name is Klamath, probably tcuwa'kän, arrowhead place, derived from the abundance of arrowhead or wappatoo roots (tcuwa') gathered there.[38]

SETTLEMENTS

221

The occupation of this territory is determined by the manner of life. The fixed villages are the winter residences to which people return year after year. Early spring finds them leaving for favorable fishing stations where there are successive fish runs. Through the summer they move to the prairies to gather edible roots and berries or to the mountain and desert to hunt. During most of this time families are widely scattered and the winter villages quite deserted, but with the ripening of pond lily seeds in the marshes during August [262] and September they again congregate. The pond lilies grow in enormous quantities, the seeds (wo'kas) constituting a staple second only in importance to fish.

[37] Meacham, Wigwam and War-path, 232.

[38] Coville, Notes, 90.

361

The towns listed below are mostly winter settlements. Each held one or more earth-lodges. There may be more than are listed on Sprague river, the only part of the region I did not visit. With this exception I think none have been overlooked.[29] The towns are grouped in the list according to tribal subdivisions.

131
361

I. *Klamath marsh—Williamson river group* (*ă'ukckni*).—Settlements are in two principal groups: along the southern margin of Klamath marsh and on the lower Williamson river. Although a few more were indicated in the latter region, I was told that the winter population at the marsh is the larger. They do not live on the western side of the marsh, as the snow-fed streams there are too cold for fish. The upper part of Williamson river, a rugged canyon, is unoccupied, but the towns are practically continuous from above the Sprague river junction down to the point where the river leaves the hills. Several others are on the lake front near-by. Evidently the middle Sprague river settlements should be included with this subdivision, but there is some doubt. Towns there are widely separated and extend a considerable distance up the river; the easternmost is somewhere west of Gearhart mountain. I am not certain that Sycan river is regularly occupied; roots are dug there. Sycan marsh is not occupied; it is a summering place for ă'ukckni, for those of Yainax in particular.

131
361
103

1, mū'tcuia'ksi, near the bridge toward the eastern end of Klamath marsh.

2, k'ʀtaiwa's, along the eastern side of the marsh. A cremation pile lies south of this town.

3, gūpgūa'ḳsi, houses stretching for perhaps two miles here, with a cremation pile near-by.

4, i'wal, and 5, kla'djōḳsi, houses for some distance along this tongue extending into the marsh. A third cremation pile is east of i'wal.

6, du'ˈIlḳūt, a very large town, perhaps a hundred house pits in an area three hundred yards by one hundred. Others extend along the marsh to the east.[30] All the tribelets congregated at this spot in the summer to gather lily seeds.

---

[114]

[29] Gatschet lists sites (1:xxviii footnote, 142, *passim*). Many of his items are only place names; no permanent town is included that is not also in my list. In a *few* instances he has misinterpreted his information.

[172]

[30] This would be an excellent site for archaeological exploitation. House pits here are more distinct than any others I have seen; elsewhere they have been leveled by the plow.

103 131 7, awa'lwaskän, at least five earth-lodges here. Houses scattered between this site and the last.

361 8, wa'ktale's, and 9, la'laks, slope steps,[31] two settlements on the higher ground where Williamson river leaves the marsh. The second had twenty houses on both sides of the stream.

[226] [114] 10, lobö'kstsöksi, on the bluff on the left bank of the Sprague river at the railroad bridge, with a few houses on the opposite side. There is a dam for salmon here. Gatschet gives the locality name as ktaí-tú-pakshi, standing rock.[32]

11, A site on the south side of Sprague river below the dam.

12, ḳ!ötewă'ëts is a large winter settlement about two miles above the dam on the south bank of this river.

[823] [226] 13, komă'ëksi is a site on both sides of the river south of Braymill, four miles from Chiloquin. There is a cave here which was the home of KEmü'kümps, the culture hero. Near-by is wo'kstat, the site of the only first-fish rites among the Klamath.

14, ḳa'umkän is about six miles above this cave. Many people lived on both sides of the river there. A cremation pile is there, probably the only one on Sprague river. The place takes its name from a spring (ḳa'üm) on the western bank.

Whether there were permanent settlements above this on the river is difficult to say. At least there were settlements (15) of some sort on the river near Yainax before the coming of the whites.

16, hiedicluë'luke, a settlement west of Gearhart mountain.

[226] 17, bEzükse'was (from bEzüks, obsidian); there are many people in this town on the right bank which extends for a mile below the Sprague river mouth. On the opposite side, ha'potgüs, is a dam in which spring fish are caught; near-by are a few summer houses.

[251] [226] 18, tákalma'keda, a town half a mile long on the right bank. The houses are on the bottomland along the river with quite a number on the opposite flat (19), called k'tai'di, lava. A little south is a part of this settlement, called glă'tapak'is. Of the distinct pits at tákalma'keda, four are about twenty-five feet in diameter, one, fifteen feet. Northward from the town are a considerable number of storage pits and a fish dam.

20, djigiă's, houses on the river level on both banks and on a higher bench on the right. There is a ford here.

---

[31] Gatschet, 1:74. Several other camping places in the vicinity on upper Williamson river are also mentioned.

[32] *Op. cit.*, 1:76.

21, ķ!o'ltawas, a town of ten or fifteen earth-lodges on the left bank, with houses on the right bank extending to the next settlement downstream. There are otter (ķ!olt) holes in the right bank, hence the name. A mythical otter that lived here is seen in a rock standing in the water; on his back are his children, smaller rocks. 103 131 361 [823]

22, at'awīkc, "to catch fish in still water," six to a dozen houses on the right bank; a few on the left. The water here is quiet; fish are caught with the trolling net. [226]

23, ya'ak (ya'ac, willows), two dozen or more houses on the right bank. This was the largest river site in early reservation days, the road from Link river (Klamath falls) fording the river here. Of three house pits together, with their margins nearly in contact, two are twenty-five or thirty feet in diameter, the other fully five feet more. A cremation pile stands on the hill above this town. It is now leveled by marauders, as are all the others in this country, but it apparently covered an area forty feet in diameter.

24, tsa'k'wi, houses on the right bank with a few on the left.

25, wĭtă'mŭmpsi, bear's place (wĭtă'm, black bear). This is a high bluff on the right bank above an eddy in the sharp bend in the river; the scene of vision questing. A large shaman's earth-lodge is located here. Fish are caught all year long above this town. [823] [756]

26, goyᴇmske'ᴇgls, crawfish crawl out, or kiẓke'trũs, small lizard, a town half a mile long beginning a quarter-mile above the highway bridge. The houses are on the abrupt slope right to the river's brink, and some on the little bluff above. There are pits of perhaps forty or more houses here, but at least half are dome-shaped cooking houses, for they are for the most part only six to ten feet in diameter, with few as much as fifteen feet. One of eighteen feet has its dome-shaped kitchen lodge clearly indicated on the north side. [226] [343]

27, wᴇla'lksi, named for a big quaking-aspen (wᴇla'l) there, is on the eastern shore of Agency lake. A few ā'ukckni live here in winter, in five or six small houses.

28, loķ'o'gūt, warm, a little warm spring near which are two houses on the higher land near Agency lake. [133]

29, tcŏ'klalŭmps, service berry, which grows here abundantly, is a town of one or two small houses overlooking the lake where the Chiloquin road meets the lake highway.

Other towns may have been at ya'mzi, on the western side of Yamsay mountain, and ķokenă'okᴇ, Spring creek, a large northern affluent of Klamath marsh.

103 • 131 361 II. *Agency lake group* (*kowa'cdikni*).—The winter home of these people is on Agency lake, the northern arm of Klamath lake. My questioning did not make it wholly certain that this group is independent of ă'ukckni. In fact they join them at k'ᴇtai'di (19) on Williamson river for the spring fishing.

[756] [226] 44, kowa'cdi is close to the mouth of Wood river. The site is a quarter-mile long. One informant stated that it contained twenty houses, another two earth-lodges (one a shaman's), not incompatible statements. A spring here permits fish to remain all winter. A few houses are at another spring a quarter-mile east.

[133] III. *Lower Williamson river group* (*du'kwakni*).—These settlements are close to the mouth of Williamson river. This region, du'kwa, is one of marsh, separated by a considerable section of open and higher plain (pᴇnŏ'ŋs) from the nearest ă'ukckni settlements. Pᴇnŏ'ŋs seems not to have been occupied in pre-reservation days, although du'kwakni and ă'ukckni now live there. Du'kwa people seem also to live across the lake at Pelican bay, the home of the gu'mbŏtkni. But whether this is a regular thing, or only a matter of my du'kwa informant's [222] personal history, I am not sure. At any rate they go to dig roots in the marshes of the western and northern sides of Klamath lake in summer, not to Klamath marsh. Their winter settlements are on the isolated bits of higher ground within a mile of the river mouth, and on the marsh front immediately south. Most of these settlements, too, are on the right bank of the river.

30, mo'aḳsda, five or seven earth-lodges on the left bank nearly a mile above the mouth. Five more houses stood on the opposite bank with numerous springs behind them and the du'kwakni cremation pile a half-mile above.

31, wickămdi, four or five houses on the right bank below this, one or two a little below, then a cluster of four and another of two farther downstream.

32, la'wa'lstŏt, three houses on the point forming the right side of the river mouth.

33, mo'giŋkünks, the largest settlement in this district with five or six earth-lodges and as usual a number of small structures. This is on the left bank a quarter-mile above the mouth. One or two houses are on this side immediately at the river mouth.

34, djiŋgüs, four or five houses at a spring on the lake front to the east of the mouth, with one or two more farther in the marsh.

[TEXT CONTINUED ON PAGE 18]

103
131
361 [222] [132] IV. *Pelican bay group (gu'mbötkni).*—This includes the Pelican bay district (gu'mböt) on the west side of the lake, the settlements along Four Mile creek, and those on the marsh north of the lake. Runs of fish are plentiful on Wood river in the spring when the snow melts on the mountains. People come up along the river in the summer digging camas. But above Fort Klamath there is too much snow to live during the winter.

35, sle'taksi, a group of two or three earth-lodges on the west side of Seven Mile creek near its mouth. A little spring here keeps the water warm enough for fish even in winter.

36, wudö'kän is a settlement in the marsh a mile from the last, and east of Seven Mile creek.

37, iwünau'ts, two earth-lodges on the western side of a little creek emptying into the lake two miles east of Recreation P. O. Houses are scattered along the marsh shore to the northern side of Pelican bay.

[823] [756] 38, dünö'ksi, an open space overlooking the northern end of Pelican bay and containing many earth-lodges. Others are on the lower level, lɛlä'ksti, close to the bay. This is immediately north of the mouth of Four Mile creek. A cremation pile stands a hundred yards north of this town on the slope above the bay, beyond an outcrop of rocks said to be transformed shamans. A big lodge of a shaman on the lower level has a pit twenty-eight feet in diameter; another earth-lodge pit is nearly twenty feet across.

39, *e'o'k̦ai, four or five earth-lodges a few hundred yards up Four Mile creek on the left bank.*

[756] *40, wa'lö'kdi, four to eight earth-lodges, one a shaman's, somewhat farther up the creek on the opposite side.*

41, Wak̦'a'k, a winter settlement south of the high ridge south of Odessa. North of the settlement is a sweat-lodge used by mourners.

42, gai'löks or gaila'lk̦s is on the point south of Odessa or more probably between Howard and Shoalwater bays. No winter settlements here but a camping place where du'kwakni and gu'mbötkni roasted camas in the spring.

[136] 43, stö'kmate, Eagle point, is a similar spring camp site. In the hot springs here are harmless black snakes (kamdila'k) which crawl over the swimmers. Curiously, in view of the Klamath tendency to localize their tales, there is no story concerning this locality.

Two other localities may belong to this group: 63, e'o'k̦ak̦, gulch, on Wood river toward the mountains, and 64, e'uk̦wa'lkai on the east

side of Wood river in much the same locality. These may be the 103
same site. 131 •

V. *Klamath Falls group (iuʺ laloŋkni)*.—All the people of the lake 361
from Modoc point southward are named for their principal locality, iuʺlaloŋᴇ, Klamath falls. Despite the large area, they are relatively few in number. In summer they resort to the marshes west of the lake or fish on Lost river. The district along the eastern shore of the lake from Modoc point nearly to Algoma is called neʺluḳsi (neʺluḳs, a late sunrise), from the circumstance that a low mountain here cuts off the morning sunlight.

45, kᴇt!ai'ksi, point of rock, a promontory two miles or so northwest of Modoc point, is their northernmost settlement.

46, suwiakă'čks, jump over, is a large village at Modoc point. It extended on both sides of the headland and for three-quarters of a mile south. The place takes its name from a large rock (about three and a half feet high) which stands a half-mile south of the point. It was a trial of skill to run uphill and jump over the rock. Bare island (au'cmi) opposite is their camp site, and has no permanent settlements.

47, iulă'u, promontory, is a fishing village occupied in early spring. Pictographs are painted on the rock slide north of this.

48, diu'wiaks (named for its little spring, di'wik) is a winter
settlement at the railroad point Ouxy. Little fish ran in the spring [226]
early in the year.

49, ḳau'ŏmŏt, a half-mile south, is, like all these lake sites, crowded along the foot of the mountain on the lake shore. There are many
earth-lodges about a large spring here. The lodge rings are so clear [172]
that this would be a good place for archaeological excavations. Its
name is from ḳau'ŏm, a place where fish run.

50, dī'tk!aḳs, boiling spring, is now known as Barclay spring. [133]
There are many earth-lodges north and south of this. Two cremation piles are to the north on the highway, one distant a hundred yards on a rock slide, the second twice as far and directly on the southern boundary of the reservation. Unlike the cremation piles on Williamson river, no glass beads or iron was to be found at this second site.
South of Barclay spring by three hundred yards is a deep nameless [231]
spring into which pups are thrown to train them for hunting. A large
sweat-lodge used by mourners is situated at the foot of the slope near [343]
the angle of the marsh east of Algoma.

103 51, kölwa'l, a point, is Rattlesnake point at Algoma. Only a few
131 live here during the winter but it is a favorite resort in the autumn
361 when chokecherries and wild plums ripen.

[222] 52, wuḳ!o'twas, wood knot, Buck island, is so called because the island in the lake is likened to a knot in a piece of wood. In addition to old house pits here not occupied by any group of the historic period, there are a few winter houses on the southern end and summer camps at the northern end where plums could be gathered. It was a favorite sport to dive from the rocks (called sohowă'ēks, diving) on the northern shore.

53, lama'teksi, a place on top of the end of something, is on the point east of Buck island, and 54, k!su'nk!ai, grassy place, is three-fourths of a mile south on the shore. Many people are at both localities during the winter. There may be old house sites here like those on Buck island. Wa'toŋks is a hill a half-mile east where wild plums are
[823] picked. There is an outcrop of white rock high on the hillside above iu'li (meaning deep in), the end of the marsh east of these settlements. This is said to be the net of Kᴇmŭ'kümps, the culture hero, spread to dry.

55, iwau'wŏnᴇ, meaning against the side hill, is a large settlement
[764] on both sides of Link river at the highway bridge. A crematory is on
[726] the hilltop on the east side a quarter-mile north. Shasta sometimes swam the river south of the village or crossed by the islet below the little lake Ewauna to attack the group on the east bank. This settlement is at the lower end of the falls (Klamath falls) that constitute
[226] Link river in its brief passage through its gorge. This is one of the principal fishing places of the region and advantage is taken of the
[823] ledges that form the falls for the construction of fish dams. But these, like all others in Klamath territory, are attributed to the culture hero, Kᴇmŭ'kümps.[33]

56, iu'"laloŋᴇ, meaning on the end, is the largest village of the southern lake people and gives its name to the whole group. There are earth-lodges on both sides of the falls but particularly on the western bank from the river mouth to within half a mile of the present power dam. There are many at the point at the river mouth (hence the name of the site) and thence extend westward about a little bay. A group of tall upstanding rocks at the point, called ḳ!taigī'ŋklᴇ, hole

---

[114] [33] Gatschet's reference (1:94, 97) to the Indians scooping up fish from the dry bed of the stream when a strong south wind drives back the waters in the lake seems like a purely mythical reference, but is confirmed by Clarke (Rock Piles, 41).

103

through the rock, had only a narrow way between them to allow 131
passage along the shore. On a point of rocks on the hill above stands
a cremation pile. A hillock west of the bay is called lalau′ḳ!ŏt, flat, 361
for the many flat rocks on top. The opposite point of the river mouth
also has a settlement, called tc!a′tc!ŏmai, for some unidentified bird.

57, wĕḳā′ĕla, fallen tree, is a settlement of moderate size on the shore a mile west of the river mouth, now intersected by the road.

58, wut!ana′kŏḳs, a low gap, and 59, iup!a′tŏna, end place, are summer sites respectively at the ends of a little marsh (now drained) on the west side of the lake.

60, woḳsa′lks, lily seed (wokas) picking place, is a summer camp [222]
on the north shore of Wokas marsh. When leaving in the fall it is
customary to sink the canoes at the edge of the marsh, hide the grind- [501]
ing slabs in the juniper thicket, and pack by a regular trail to [415]
dĕ′ktcŏŋks, whence they return to the winter villages.

61, dĕ′ktcŏŋks, netting place, is a camp site on the west shore of [226]
Klamath lake opposite Buck island. Midway between this site and
the island is a favorite place for catching fish at night with a tri-
angular scoop net. The point Skillet Handle is called iuwa″lᴇ, end of
a point, and a flat-topped mountain west of Wocus bay, seolŏpġls.

62, sa′stltḳa′wals, Shasta stand on end, is Squaw point where a few [823]
Klamath falls people might be found in winter. There are holes in
the rocks here in which they pound to make the wind blow, pounding
in those on the south side, for instance, to bring a south wind.

TRIBAL SUBDIVISIONS

The Klamath are not a single political entity. There are four or 101
possibly five subdivisions or tribelets, each occupying a distinct dis- 619
trict, and practically autonomous. This is separatism of the familiar
Californian order. Nevertheless, the cohesion rising from a common
dialect, common culture, and a uniform reaction against all non-
tribesmen, which on occasion leads to jointly taking the field against
them, produces a tribal solidarity resembling that of the Plains people.

The separatism is immediately clear in any discussion with them. They invariably reserve the modern name Klamath for the Klamath marsh—Williamson river division; all others are Klamath only by extension. The groups are readily defined by the districts they

The subdivisions or tribelets are:

I. ă'ukekni, the people of Klamath marsh and middle Williamson river, the Klamath proper. Evidently the Sprague river people are included here; there is some doubt, but I am even more doubtful whether there were settlements as far away on Sprague river as Yainax in pre-reservation times. 101 131 619

II. kowa'edikni, those of a village of that name on Agency lake. They may be ă'ukekni.

III. du'kwakni, on the delta of Williamson river. These are more closely affiliated with the Pelican bay people than with ă'ukekni.

IV. gu'mbötkni, those of Pelican bay and the marsh to the north.

V. iu"laloŋkni, the people of Klamath falls (Link river) and the eastern shore of Klamath lake.

The names are those of the districts they occupy with the suffix -kni, those of, people of: ă'ukei, Klamath marsh; du'kwa, the district about the mouth of Williamson river; gu'mböt, Pelican bay, possibly taking its name from Rocky point; iu"laloŋᴇ, on the end, the village at the outlet of the lake into Link river.

It is now difficult to get a true estimate of the size of these groups. The ă'ukekni count twenty-nine or more settlements, half of the total; of the others iu"laloŋkni have thirteen, gu'mbötkni seven or more, du'kwakni five, and kowa'edikni, one. The towns vary considerably in size, yet this mere count agrees closely with the populational proportions as my several informants phrased them. The ă'ukekni are by far the largest group, perhaps as large as all the others together. Nancy Phillips recalls the large number of children who played together at gu'mböt, Pelican bay. At this place the settlements do form a large compact group. Next in order she places the du'kwa group, then those clustering about iu"laloŋᴇ at Klamath falls, and goyᴇmske'ᴇgls on Williamson river. The settlements on Williamson river are small and scattered, but she places their joint population above the gu'mbötkni. The iu"laloŋkni were comparatively few despite their large territory. Of the ă'ukekni more lived at Klamath marsh even in winter than on Williamson river. The huge size of a single site, du"llḳüt, bears this out. 361 162 [115]

Consonant with their unequal size is it that the principal chief, at least in early reservation days, was the principal chief of the ă'ukekni; all others were distinctly subordinate in prestige. According to one informant, himself a du'kwa man, the ă'ukekni are the highest people. Kᴇmü'kümps, the culture hero, made them first, best, and strongest; later he made the others. 619 622 [829]

grown up among the Klamath, Klamath in speech and custom, were K 567
not tempted to begin life anew elsewhere. Some, at least, had con- K
siderable prestige. Pit River Charley, for instance, a freed slave, [786]
returned from his people in 1873 with novel rites which were engrafted [177]
on the Ghost dance then newly come to the Klamath.[62]

Trade is probably of no great consequence within the tribe although K
it figures intertribally. Contacts were few and frequently unfriendly 439
until after the coming of the whites. The exception is the neighboring 221
Modoc groups; others are too distant. Winters are too severe for 361
travel and trade, but summers find the Warm Springs people in residence with the Klamath. These similarly set out for Warm Springs and the Dalles when the grass begins to grow, camping there in the open during the summer, and building mat-covered structures of
earth-lodge shape (wakĕ'ploḳs) if they stay through the winter. K
Slaves, Pit River bows, and beads are taken there to trade for horses, 439
blankets, buffalo skins, parfleches, beads (probably dentalium shells), 436
dried salmon, and lampreys.[63] Two slave children are valued at five 567
horses, several buffalo skins, and some beads. This is not far from the values recorded by Taylor in 1859; one woman was worth five or six horses, a boy one horse.[64]

The Molala are also visitors and are met on the headwaters of the K
Rogue west of Crater lake. From them buckskins are obtained for 648
pond-lily seed and beads. Relations with the Shasta have not always [437]
been unfriendly; some of the Klamath Falls group and Modoc married S
with them, possibly only since the white advent. The nearest Shasta 131
settlements at Shovel and Jennie creeks can be reached afoot several K
days' journey down the Klamath. Laik'ĕlmi is a jointly occupied 648
fishing site somewhat upstream but below the Klamath canyon. Skins [226]
and skin blankets are traded for Shasta beads. Dixon states that [437]
Shasta trade with the Klamath is slight.[65]

In the period 1860–70 the few Shasta remaining in their territory congregated S
on the lower Shasta river and near the frontier town, Yreka. They were 131
reached by crossing the Black Mountain range. At that time this was a S
much mixed group, principally half-breeds. My informant Tom Lang, taken [302]
there as a youngster, remarked how he was afraid of their highly tattooed faces.

Intercourse and marriage went on freely with the Modoc. They K
were visited on Tule and Lower Klamath lakes, and joined for the 648
fishing on Lost River near Olene. 131

and they tended to retain a greater concern with hunting, a con- M 133
dition which archeology tells us was characteristic of the early 226
Klamath, but which the latter came somewhat to relinquish with 224
their concentration upon the product of the waters. Likewise, 433
the Modoc seem to have placed a somewhat greater premium M
upon the gathering of wild seeds, in a typically Basin-California [222]
manner. Nonetheless, fishing was by no means neglected, and [361]
their villages lay principally about Lower Klamath, Tule, and Clear lakes, as well as upon Lost River which roughly parallels the Sprague in its westward course, until it bends south to empty its waters into Tule Lake.

Protected by relatively inhospitable land to the north, by K
broken hills to the east and south, and by the Cascades on the M
west, the Klamath-Modoc homeland fostered a culture somewhat 131 •
provincial in character, owing to its remoteness from major 101
centers of development, yet distinctive in style. Neither people occupied, for any distance, the Klamath River, which drains the Klamath Lakes and falls through its canyon to the Pacific; and neither seems to have been directly affected by the culture that emerged along its lower reaches among the Yurok, Karok, and Hupa.

Favored though they were by contrast to the Great Basin, the K
Klamath uplands did not support a large aboriginal population. M
The Klamath and Modoc together have variously been estimated 161
to have totaled between twelve hundred and two thousand, the Klamath having about double the numbers of their southern kinsmen. Population densities provide a further perspective. Those for the Shasta immediately to the southwest and for the Oregon Coast were roughly ten times as great as that of the Klamath-Modoc. The Kalapuya of the Willamette Valley and the Takelma of the Upper Rogue furnished figures about twice as great, and the Achomawi and Atsugewi of the Pit River drainage south of the Modoc had densities four times the value for our tribes. Within the Plateau, the Sahaptin-speaking peoples of the middle Columbia and the Blue Mountains approximated their figure. In the Great Basin and the Southern Plateau, the Shoshonean Bannock, Northern Paiute, and Shoshone provided figures only one quarter as great. If the figure is taken to reflect the intensity of land use, the Klamath Basin was on a par with the

KLAMATH CHILDHOOD AND EDUCATION[1]

by

MARION PEARSALL

INTRODUCTION

128 culture, social and political organization are
not described here except in their effect on
124 education. Wherever particular items are men-
tioned, we specifically asked our informants for
a description, even though they had been de-
scribed in previous ethnographies. Such ac-
counts may thus be taken as corroborating
earlier evidence unless otherwise specified in
the text.

131 The Klamath reside in their old territory
178 in southern Oregon, but the aboriginal way of
life has long since disappeared. Today they are
241 farmers and ranchers, but a considerable part of
the earlier culture remains alive in the memo-
233 ries of a few oldsters. Our seven informants
(4 men and 3 women) were all in their late
178 seventies or eighties and had participated in
the last phases of the aboriginal culture as
115 children. It is regrettable that it was neces-
sary to reconstruct childhood training from the
reminiscences of elderly individuals. Doubtless
much of the material represents the ideal rather
than the actual pattern of education. The
ideals do, however, give a definite insight into
what was considered important in the upbringing
of children, whether these standards were always
maintained or not. Since there is little or
nothing in the early literature on this subject,
there is no way of comparing impressions re-
ceived from old people who are admittedly look-
ing back to "the good old days" with impressions
of objective eyewitnesses to the old ways as
they were really practiced.

BIRTH AND INFANCY

Barrenness is sometimes con-
sidered cause for divorce. Since the blame
842 seems to fall most commonly on the woman, her
husband's parents may suggest that he send her
586 away and get a wife who can provide him with
children. Ordinarily, though, the parents-in-
606 law are more lenient with a barren woman.
Most Klamath express a preference for boys. A
842 variety of reasons are offered, the most common
being that boys are less bother than girls.
"Girls are always getting into trouble, and you
just raise them for someone else because they go
off to their husbands when they get married."
Once the child is born, however, there seems to
be no special favoritism shown to boys. One

INTRODUCTION.

K
M
122

The following information concerning the Lutuami or Klamath Lake and Modoc Indians of northeastern California and southern Oregon was obtained during the summer of 1907 as a part of the work of the Ethnological and Archaeological Survey of California, maintained by the University of California through the generosity of Mrs. Phoebe A. Hearst. These Indians now live almost entirely on Klamath Indian reservation in Oregon,

M
K

M
K situated about upper Klamath Lake and in the mountains to the
101 east; except for a part of the Modoc in Oklahoma. It is the
131 object of the present paper to discuss briefly the conditions of
M aboriginal life among these people, due consideration being given
K their natural environment and the influence of surrounding
128 peoples upon them.

TERRITORY.

M The territory occupied by the Klamath Lake and Modoc
K Indians lies chiefly in the drainage basins of Upper and Lower
101 Klamath lakes and Tule or Rhett lake. From a point near the
131 confluence of Keen creek with Klamath river the western boundary
of their territory probably extended along the watershed
separating the Klamath lake and Rogue river drainages, to the
K foothills of the mountain in which Crater lake is situated. It
823 should be noted, however, that the Klamath, while they feared
Crater lake, did go upon certain occasions to the lake and seem
not to have been molested there by other Indians. It would seem
that the lake was looked upon as a sort of territory of mutual
rights by the peoples in its vicinity. They visited it when they
desired to acquire great merit in hunting or other pursuits in
which supernatural power was necessary. To go and bathe in
this wonderful lake was a brave thing to do, and made a man
lucky for hunting or other similar pursuits and made him very
K strong for war. It would appear that the relations formerly
131 existing between the Klamath and the people of the Rogue river
648 drainage were not at all friendly, so that the Klamath seldom
ventured as far west as the crest of the range. They did on
occasion make up large parties and go up to the crest of the
range for the purpose of hunting, but small parties rarely ventured
so far. The region for some distance to the west and
northwest of Crater lake was also visited by the Klamath for the
K purpose of gathering berries in season.

101 On the north the boundary extended as far as to the headwaters
131 of Deschutes river, thus including the whole drainage
133 basin of Klamath marsh.[1] On the east the boundary probably

---

K
[101] [1] The Bureau of Ethnology's map in Bulletin 30 gives to the Lutuami
territory as far north in the Deschutes drainage as latitude 44. See also
[114] volume I of this Bulletin, 779, 1907.

5: Barrett E-5 (1907) 1910
NR10 Klamath NR10
Modoc NS17

extended far enough to include the drainage into Sycan marsh, and thence on toward the south, passing several miles east of the town of Bly and including the whole of the Sprague river drainage.[2] The southern part of the eastern boundary probably passed somewhat east of Clear lake and around the head of Lost river. The southern boundary was probably the divide between the drainage of Klamath and Rhett lakes and that of Pitt river.

K
101
131
133

The Lutuami[3] are divided into two slightly different dialectic divisions: the Klamath Lake, usually known simply as Klamath, occupying a comparatively large territory about Upper Klamath lake, the northern part of Lower Klamath lake, Klamath marsh, and the region to the east; and the Modoc, occupying the region about Rhett lake and the southern end of Lower Klamath lake. One informant mentioned a third dialect, which he said was spoken by the people formerly living on Link river and about Linkville or what is now known as Klamath Falls. In view of the slight lexical differences between the Klamath and Modoc dialects, it seems very probable that if a third linguistic division did exist it was inconsiderable and not more than a sub-dialectic variation. At any rate the only linguistic units recognized by the people themselves are the two dialects spoken by the Klamath and the Modoc. The fact that the two divisions speak slightly differently, does not seem to appeal to the people themselves so much as the fact that they were in former times politically disunited, and were in fact, upon certain occasions at least, at war.

[2] This is the boundary generally claimed by the Klamath. One Paiute informant, however, claimed that the territory of his people extended as far west as Yam Say peak and the Black hills, thus including Sycan marsh in the Paiute country. Like Klamath informants he stated that the boundary passed a few miles east of Bly.

[3] Gatschet, Contrib. N. A. Ethn., II, gives Lutuami as meaning lake, *i.e.*, Tule lake, in the Achomawi or Pit River language. The people have no name for themselves other than maklaks, person, Indian. Maklaks is possibly the source of our word Klamath, the origin of which is unknown. The Klamath Lake people are called in their own language Eukshikni maklaks or Euksknì maklaks, at the lake people, from Eukshi, which denotes specifically Klamath marsh, but also the adjoining country, including the eastern shore of Upper Klamath lake. Eukshi appears to be derived from eush, lake. The Modoc are called Montokni maklaks or Modokni maklaks, in the south people, from moatak, Tule lake. Moatak is a derivative from muat, south.

end of Horse Fly valley and Lockey Flat, passing in the vicinity of Keno Spring, and thence westward through, or in the vicinity of, the village of Dairy. It passed a short distance north of Bale's lake and Olene and appears to have left the whole of Lost River valley in the territory of the Modoc. It passed either along the eastern shore of, or through, Lower Klamath lake. Further than this no definite information was obtained concerning this secondary boundary.

ENVIRONMENT.

M
K
13
[184]

The natural environment of the Lutuami, a high, mountainous and volcanic region, filled with lakes and marshes, influenced their culture in many ways. The two lakes, Upper Klamath and Tule or Rhett lake, formed the centers of population for the two divisions, the Klamath and the Modoc. Along the western shore of these lakes, and of Lower Klamath lake, as well as along the high plateau to the east of Upper Klamath lake, there were considerable forests of conifers which provided material for canoes and houses as well as a part of the food supply. In fact the whole western portion of the territory is well forested. The eastern part, however, notably about Yainax agency and eastward, is to a great extent a semi-desert, sage-brush country. In this eastern region there are many fertile valleys, as for instance, along Sprague and Sycan rivers, but on the whole the territory is by no means so desirable for habitation as that about Upper Klamath lake and Klamath marsh, where the soil is very rich and productive. The old fault line in which Upper and Lower Klamath lakes and Klamath marsh are situated has existed so long that a large area has silted in and formed a very fertile country, which provided in aboriginal times an abundance of various tubers, seeds, and other vegetable foods. Among the most important natural features of this region are the great tracts of marshy land. These marshes are covered constantly with water from a few inches to several feet in depth. In these, particularly in Klamath marsh, is found the staple article of food among the Klamath, and to a certain extent also among the Modoc, the yellow water-lily, *Nymphia polysepala*. Large areas of marsh are completely covered with this water-lily to the ex-

THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

By Albert S. Gatschet.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

128 The topography of these highlands, which contain the headwaters of the Klamath River of California, will be discussed at length after a mention of the scanty literature existing upon this comparatively little explored tract of land.

THE HOME OF THE PEOPLE.

131 657 648 The home of the Klamath tribe of southwestern Oregon lies upon the eastern slope of the southern extremity of the Cascade Range, and very nearly coincides with what we may call the headwaters of the Klamath River, the main course of which lies in Northern California. Its limits are outlined in a general manner in the first paragraph of the treaty concluded between the Federal Government and the Indians, dated October 14, 1864, which runs as follows: "The Indians cede all the country included between the water-shed of the Cascade Mountains to the mountains dividing Pit and McCloud Rivers from the waters on the north; thence along this water-shed eastwards to the southern end of Goose Lake; thence northeast to the southern end of Harney Lake;* thence due north to the forty-fourth degree of latitude; thence west along this same degree to Cascade Range." It must be remarked that the homes and hunting-grounds of two "bands" of the Snake Indians were included within these limits, for these people were also made participants to the treaty.

Here, as with all other Indian tribes, the territory claimed must be divided into two parts, the districts inclosing their habitual dwelling-places and those embodying their hunting and fishing grounds, the latter being of course much larger than the former and inclosing them. The habitual haunts and dwelling-places of the tribes were on the two Klamath Lakes, on Klamath Marsh, on Tule Lake, and on Lost River. Some of these localities are inclosed within the Klamath Reservation, of which we will speak below.

133 The Cascade Range is a high mountain ridge following a general direction from north to south, with some deflections of its main axis. The line of perpetual snow is at least 10,000 feet above the sea-level, and the altitude of the highest peaks about 12,000 to 14,000 feet. On the west side the sloping is more gradual than on the east side, where abrupt precipices and steep slopes border the Klamath highlands and the valley of Des Chutes River. The range is the result of upheaval and enormous volcanic

---

* Harney Lake is the western portion of Malheur Lake, and now united with it into a single sheet of water.

000 one in a series of similar butcheries. Apparently it occurred in 1852, and
the particulars are all given in Texts, pages 13 and 14.

175 One of the earliest reports upon these tribes made to the Bureau of
101 Indian Affairs at Washington is that of Joel Palmer, Superintendent of
131 Indian Affairs for Oregon, dated Dayton, Oregon, September 11, 1854.
Palmer states that the lands of the Klamath Indians extend upon the eastern
base of the Cascade range for about thirty miles east, and that east of
them live the "Mo-docks," who speak the same language as the Klamaths;
and east of these again, extending farther south, are the "Mo-e-twas" (Pit
175 River Indians). These two last-named tribes have always evinced a deadly
648 hostility to the whites, and the Modocs boasted of having within the last
four years murdered thirty-six whites. Palmer entered into an agreement
with the Klamath Indians to keep the peace with the white people, and also
sent messengers to the Modocs and Pit Rivers, believing that henceforth
[161] the immigrants would be spared from their attacks. The Klamath Lakes
were then enfeebled by wars with the surrounding tribes and by conflicts
among themselves, and were said to number but four hundred and fifteen
souls. He counted seven villages on Upper Klamath Lake, two on Pliock
Creek (P'laíkni or Sprague River), three on Toqua Lake (Túkua), and one
175 on Coasto (Koháshti) Lake.* The Indians had some guns, horses, camp
411 equipage, and the aboriginal war-club and "elk-skin shield" (kaknō'lsh).
231 Little Klamath Lake he calls An-coose, a corruption of Agáwesh.

714 Neither Klamath Lake nor Modoc Indians have taken any part in the great Oregon war of 1854-'56, although their sympathies were of course strongly in favor of the aboriginal cause.

000 For the year 1854 Powers records a battle fought by Captain Judy against Modoc and Shasti Indians on the Klamath River, north of Yreka, in which some women of the Shasti were killed.

The Report of 1859 speaks of continued hostilities on the side of the Modocs against passing immigrants and of the murdering of a party of five white men in Jackson County, Oregon. Two of the murderers belonged to the tribe of Chief Lelékash, and three of the perpetrators were seized and killed by the Klamath Indians (page 392).

---

* This would make only six, not seven, villages.

in importance to fish. Summer is also the time of travel and trade, 221
taking people as far as the Dalles where they may elect to spend the
winter. Winters are exceptionally severe at this altitude (4000 feet), [132]
with deep snow and lakes, marshes, and even streams solidly frozen.
Movement is stopped and unless a winter residence has been chosen [133]
which gives some possibility of fishing, starvation may be faced before 221
spring. These winter sites are in sheltered, sunny spots on running
streams or at springs warm enough to prevent ice from forming. The 361
families return in the fall, rebuild the earth-lodges from the remains [226]
of the previous year's structure, and are all snugly housed by mid-December. The only permanent settlements are the winter villages.
The summer residences are shifting, and while reoccupied from year
to year, there is no feeling that particular camping localities belong
to certain groups. The summer camps are rather indiscriminate aggregations of any Klamath, but the winter locations are so fixed of habit [628]
as to give a measure of political separatism to the several localities.

The case of Tom Lang's family is typical. Their permanent winter home is at iu'laloŋk, a large village on the west side of Link river at the foot of Klamath lake, hence Tom is considered one of the southern lake people, iu'ˑlaloŋkni generically. His family is accustomed to move for the spring fishing to ditk!aka, Barclay spring, or to Modoc point, both on the east side of the lake, where they erect temporary lodges. Crossing the lake to dö'ktcoŋks they leave their canoes and travel overland to woksa'lks on the north shore of Wokas marsh. Here Tom was born in July. When the berry and wokas harvest is ended they retrace their steps and take canoe to Algoma to pick wild plums, berries, etc. From there they drift back to their winter home.

The towns for the most part lie along Williamson river, on the southern side of Klamath marsh, and along the eastern shore of Klamath lake. As these are winter settlements, the open lake is avoided, and occupied only where warm springs outweigh its disadvantages.
They cluster along Williamson river whose sheltered valley is distinctly warmer than the lake front a few miles distant and where the [133]
running stream contains fish most of the year. [132]

The towns are not isolated, compact groups of houses, but stretch
along the banks for half a mile or more. In fact, the settlements on 361
Williamson river below the Sprague river junction form a practically 342
continuous string of houses for five or six miles, the house pits being, in many spots, crowded close together. Informants insisted that many of these were occupied at the same time. When we consider that these earth-lodges may have housed several families, there is strong suggestion of a considerable population.

103

131 IV. *Pelican bay group* (*gu'mbŏtkni*).—This includes the Pelican bay district (gu'mbŏt) on the west side of the lake, the settlements
361 along Four Mile creek, and those on the marsh north of the lake. Runs of fish are plentiful on Wood river in the spring when the snow
[222] melts on the mountains. People come up along the river in the summer digging camas. But above Fort Klamath there is too much snow
[132] to live during the winter.

35, sle'taksi, a group of two or three earth-lodges on the west side of Seven Mile creek near its mouth. A little spring here keeps the water warm enough for fish even in winter.

36, wudŏ'kăn is a settlement in the marsh a mile from the last, and east of Seven Mile creek.

37, iwŭnau'ts, two earth-lodges on the western side of a little creek emptying into the lake two miles east of Recreation P. O. Houses are scattered along the marsh shore to the northern side of Pelican bay.

38, dŭnŏ'ksi, an open space overlooking the northern end of Pelican bay and containing many earth-lodges. Others are on the lower level,
[823] lɛlā'ksti, close to the bay. This is immediately north of the mouth of Four Mile creek. A cremation pile stands a hundred yards north of
[756] this town on the slope above the bay, beyond an outcrop of rocks said to be transformed shamans. A big lodge of a shaman on the lower level has a pit twenty-eight feet in diameter; another earth-lodge pit is nearly twenty feet across.

39, e'o'ḳai, four or five earth-lodges a few hundred yards up Four Mile creek on the left bank.

[756] 40, wa'lŏ'kdi, four to eight earth-lodges, one a shaman's, somewhat farther up the creek on the opposite side.

41, Waḳ'a'k, a winter settlement south of the high ridge south of Odessa. North of the settlement is a sweat-lodge used by mourners.

42, gai'lŏks or gaila'lḳs is on the point south of Odessa or more probably between Howard and Shoalwater bays. No winter settlements here but a camping place where du'kwakni and gu'mbŏtkni roasted camas in the spring.

[136] 43, stŏ'kmatc, Eagle point, is a similar spring camp site. In the hot springs here are harmless black snakes (kamdila'k) which crawl over the swimmers. Curiously, in view of the Klamath tendency to localize their tales, there is no story concerning this locality.

Two other localities may belong to this group: 63, e'o'ḳaḳ, gulch, on Wood river toward the mountains, and 64, e'uḳwa'lksi on the east

361 at the lake's edge, large and warm enough to prevent ice forming over
a large area. Winter is severe at this altitude (4000 feet), snowdrifts
[132] are deep, and Klamath lake freezes over to a depth of some ten inches
in late December. Such sheltered valleys as that of the Williamson
[133] river, while but a few miles from the open lake, are distinctly warmer.

The annual cycle of activities is dictated largely by the food
221 habits. It is customary to leave the winter villages in April or May,
when plant growth is well under way and the flat valleys have dried,
not to return until the snow falls again and houses need refurbishing.
When fish begin to run in the spring, the Klamath congregate at the
fishing places to stay for two months or more. For example, some
join the Modoc on Lost river for several weeks to catch and dry
fish. The spring and early summer are spent on the marshes and
prairies, gathering roots such as camas and ipos. When the camas
has been dried and stored, they move to the marshes, especially to
Klamath marsh, to harvest pond-lily seeds from mid-August to the
end of September. While the women are busy with this harvest, men
hunt mule deer, antelope, and other animals whose habitat is in eastern
Klamath territory. Late summer and autumn, seeds, berries, and
nuts are gathered, the Indians congregating where these are plentiful.
Many of those at Klamath marsh, for example, move directly to
Huckleberry mountain, southwest of Crater lake, to garner these
[484] berries. Summer and autumn are the seasons for journeying to visit
and trade, for raiding, and especially for laying up a store of fish
[726] against the coming winter. It must be understood that the winter
locations are not completely abandoned during this season, for many
[251] of them are favorably situated for these very activities. But it is
[361] customary for such a group as the ăukekni division, whose winter
residences cluster thickly along the middle Williamson river, to scatter
and meet again at Klamath marsh for the pond-lily harvest in
[805] August and September. (This is the beginning of the Klamath year.)
They begin to return to the winter sites in the latter month, to start
[342] rebuilding the earth-lodges for the coming winter, a task completed
in December, by which time full winter is at hand.[219]

501 The move to Klamath marsh of the people at the mouth of Williamson river, the du'kwakni, can be made by canoe only as far as ya'ak
221 on the middle river, where they join the ăukekni in packing afoot the
rest of the distance. When the water is high, canoes can go upstream
as far as bʌzŭkse'was at the mouth of Sprague river (see the maps,

---

[219] See also Gatschet, 1:74–77.

used;[278] then grass or pine boughs, covered with dirt, are heaped half- 342
way up the side. The outer mats are held in place by tying them along the edges to poles propped against the side of the house. The rope (pĕḳ'os) used for this is three strand, braided of grass or the outer layer of tule. In placing the mats, a space about two feet across is left at the top for a smoke hole, and another only three and a half feet high for a doorway. One has to stoop to enter. The door is a mat like that of the summer house; it is not weighted nor tied down.

Drying racks are not placed inside the houses. All fish and meat [251]
are dried on racks near-by. [417]

Houses are not decorated, nor are the house posts carved or painted
except by shamans. These may paint them with horizontal stripes, 342
alternately red and white. One informant had it that men's faces,
snakes, lizards, and various other animals, not spirits, are painted on
the posts, but I am doubtful. Shamans also hung stuffed bird and [756]
animal skins about the interior. A wooden image and a stuffed crane
skin are set up outside on the northern side of the hatchway, i.e., above
the shaman's bed. Houses are not given individual names, Yurok 552
fashion, though the localizing tendency of the Klamath might have 171*
found an outlet in this.

The fireplace (sne'lŭḳs) in the earth-lodge is in the middle of the 354
floor, between the four center posts and under the open hatchway.
Neither a pit nor stones are used to confine the fire. Most of the time
there is no fire on the hearth, only in the morning and evening; at
other times the hatch is closed. A huge fire is built when it is nearly
sundown, and after the mat is drawn across the opening the heat is so
great that blankets may be dispensed with. This despite the severe [132]
winters; at this altitude (4000 feet) lakes and streams are frozen
solid. Fires are usually made by piling short lengths of wood in log- [133]
cabin (crib-work) fashion to a height of eighteen inches. They cook
when this is reduced to a bed of coals. A piece of rotten wood is
ignited to carry fire from one place to another.

Cooking ordinarily takes place outside the dwelling in a dome- 343
shaped house (sti'nä'c) erected near-by. An earth-lodge on lower 252
Williamson river, for example, set some fifty yards from the stream,
had its cooking lodge close to the bank. All the women of the house- 592
hold prepare their food together, even where several families have
joint tenancy. It is carried to the earth-lodge and there passed about

---

[278] Barrett gives the successive layers as made of "a kind of reed," triangular-stemmed tule, and circular-stemmed tule (*op. cit.*, 244).

805 dino'lōpka, later forenoon.
sĕwö'tkɛ, midday.
gawilo'la, mid-afternoon.
di'ntkɛ sa''bas, sun nearly down.

The movement of the stars gives time at night. For instance, I was told that in winter, when they sit late telling stories, it is bedtime (lo'lalöks) when Orion's belt has risen two-thirds of the distance toward the zenith. This is about ten o'clock in mid-December. Midnight is literally (?) paĭndötklüm.

There is no year count, but these people have of course no difficulty in expressing spans of years. Similarly the seasons are of little significance. There are however four period names: sɛ'a'lüm, the beginning of fall, lo'ldöm, winter, when snow begins to fall in the mountains, sḳo'w'a, the beginning of spring, pö'tda, when roots, etc., begin to ripen. It was emphasized that these names refer properly to the opening of the seasons. There is no generic word for seasons; the year is called momo'watc or e'lo'la. Gatschet observes that as an alternative to the use of month names, they reckon time by the seasons in which natural products are harvested, as udsaksä'mi, "in the big sucker time," i-umä'mi, "in the berry season," etc.[403]

This seasonal count indicates that the year begins in early fall. It is marked by the end of the wild fruit season and the withering of the leaves. This corresponds to late August or early September.[404] The exact date is indefinite; it is marked by the appearance of a new moon, but bears no relation to the procession of the constellations.

Ten months are named which purport to pass for lunar months. That is, the Klamath month (sa''bas, month, moon, sun) is a period indefinitely fixed in the solar calendar, marked by the waxing and waning of the moon, and omitting the dark phases. These people are fully aware that ten named periods do not fit the twelve plus lunations of the year. No attempt is made to make them fit, to reckon an intercalary period. The ten months are merely ten roughly marked intervals of the year-round, whose beginning, duration, and end are left indefinite as of no particular concern, but which serve the convenient purpose of designating the several periods of the year. It is quite clear that while the Klamath are fully aware of the discrepan-

---

[132] [403] Gatschet, 1:76.

[133] [404] It must be remembered that winter comes very early at this altitude (4000 feet). By mid-September ice forms on the ponds during the night. Gatschet's information confirms that of my best informants that August-September marks the opening of the year (1:74). This disposes of mid-winter and February-March as opening dates as mentioned by my other informants below.

K
M middle Columbia, far below the Coast and California, and in turn
161 considerably above the Great Basin.[6]

000 The mind's eye, drawing upon descriptions of early explorers
and modern ethnographers,[7] can recreate the life of the early
nineteenth century. It is a life that moves through a succession
of activities with the seasons, each characterized by a community
of different size and constituency. On a miniscule scale they
resemble the "task groupings" which Anastasio has analysed in
the intertribal relations on the Plateau.[8]

K During the long winters, existence is centered in the permanent
M settlements, for the altitude of the Klamath Basin is over four
221 thousand feet and snow often drifts deep. An accrued depth of
132 six to eight feet is common; while in the exceptional winter of
133 1890-91 a figure of thirty feet, undoubtedly in drifts, was recorded
361 at the head of Agency Lake. Crude, circular bearpaw snowshoes
481 provide a poor means of winter travel, and the settlements tend
262 to become isolated; most people are forced to remain in the
villages, supplementing the meager winter catch with stores of
dried fish and meat, roots, seeds, and berries.

K From a distance, the winter settlement has the appearance of
M hillocks strung out along the bank or clustered in a sheltered
221 spot. In size it may range from several score houses—there are
361 perhaps a hundred house pits at one favored site on Klamath
342 Marsh, though not all may have been occupied at the same time
—down to tiny hamlets of one or two earth lodges and a few mat
huts.[9] Within the village, the earth lodges are the dominant structures,
K with the domed huts flanking them. In Klamath settlements,
M communal storage pits shelter the bulk of supplies; but the
343 Modoc prefer to conceal foodstuffs in household caches some
251 distance from the houses.

One Klamath woman recalled her childhood hamlet, part of
K a settlement totaling roughly two dozen houses,[10] on the lower
361 reaches of the Williamson River. Here she and her parents lived
342 with her maternal uncle, the shaman later known as Alex Wilson,
whose earth lodge was the largest in the hamlet. Nearby was
another lodge, the residence of Hunter Wilson, brother of Alex
and headman of the family group. Some four or five mat-covered
K lodges and huts stood in the vicinity, the larger ones closer to
[343] the water for cooking and the sewing of tule mats, the smaller

*657 177 241

> a mere change of externals, yet the white man's ways as the red man understood them were adopted with a rapidity unequalled in most Indian tribes. . . .
>
> The vegetables grown that first year [corn, beans, turnips, carrots, peas, potatoes, artichokes, and onions][1] were a revelation and a delight to the Indians, who had previously lived so largely on small native roots. I have heard my father say that they were particularly captivated by beets which, with their red juice, they thought resembled "ittle-willy" [meat].[2]

In the effort to induce the Indians to cultivate their fields, the Agent seems to have enlisted the aid of the military. "I had about one-half acre broken for Blow," wrote Captain F. B. Sprague, "and he is at work like a white man, has it all fenced and cetera, & plants growing finally."[3]

[133] [132] The crops the first year were reported good, but subsequently they were killed by frosts or summer droughts. The elevation of the Klamath Plateau, some four thousand feet above sea level, limits farming even today. Reports are studded with the phrases, "heavy frosts," "unprecedented heat," "unusually dry and frosty." Surveying the blighted fields, the early Agents redoubled their efforts. In 1869, Applegate reported that "the teachers . . . have been for a greater part of the time engaged on the farms, along with Indian boys receiving instruction in manual labor. . . ." R. B. Hatton, schoolteacher, stiffly pointed out that he "was instructed to labor on the farms . . ." and the tenor of his remarks suggests that in so doing he had been diverted from what he considered his proper function.[4]

*657 *648 177 231 241 The following year, the new Agent, Captain O. C. Knapp, stated, "I again urge upon the Department the uselessness of trying to make this an agricultural reservation. . . . The Indians should be supplied with cattle and sheep, and they would soon become self-sustaining."[5] His words were echoed by Agent L. S. Dyar, in 1872: "These [crop] failures are very discouraging to the Indians as well as to the Agent, and demonstrate the necessity of paying more attention to the raising of cattle. . . ."[6]

*657 177 241 Nonetheless, from 1871 on, with the aid of the farmer, several Indians cultivated little farms along the Williamson River and the lake shore.[7] These in the following year amounted to some twelve to fifteen individuals who "have small patches of land of a few acres each fenced, on which they have, with the help of

M clusion of almost everything else. The seeds of this plant,
K gathered and preserved in three different manners, as described
13 in detail by Coville,[4] form the staple article of food and thus
correspond to acorns used over the greater part of California.
About Tule or Rhett lake and the smaller lakes of that vicinity
there are fewer marshes and consequently a smaller supply of
the water-lily. Thus the Modoc were much less abundantly supplied
with this staple than were the Klamath, who are said to
have had on Klamath marsh alone over ten thousand acres of
these plants. The chief vegetable food of the Modoc seems to
have been tubers and bulbs, notably camass and ipos.

M The extensive lakes of this region naturally bring great num-
K bers of water birds of various kinds, including swans, geese,
136 ducks, and wading birds, the majority of which were used by the
Indians as food and in various ways. The skins of swans, geese,
and other birds with especially fine down, were made into
feather blankets, swaddling clothes, etc. Fish were abundant in
the lakes, salmon and salmon trout being especially esteemed by
M the Indians. The presence of this large supply of water birds
K and fish developed certain specialized implements for their cap-
223 ture. For taking birds there were what may be termed a ring-
M pointed arrow, and a special net. There were several methods
K of taking fish, the most important being by the large triangular
226 dip-net used in the dug-out canoe, as shown in pl. 10.

501 The country provided also an abundance of the usual animals,
M such as deer, elk, antelope, and others used for food; and coyotes,
K gray wolves, foxes, badgers, wildcats, rabbits, and various fur-
136 bearing animals furnishing blankets and clothing.
237

BUILDINGS.

M The houses of the Klamath and Modoc were of two kinds. In
K this region where the snow on the higher peaks is always in
342 sight, and where it often reaches a depth of several feet in winter,
[133] a warm and durable house is necessary. This was provided by
[132] the semi-subterranean earth lodge, which was of the usual central
California form, and had a pit from a foot to three or four feet

THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

By Albert S. Gatschet.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

128 The topography of these highlands, which contain the headwaters of the Klamath River of California, will be discussed at length after a mention of the scanty literature existing upon this comparatively little explored tract of land.

133 the highest peaks confirm the eruptive origin of these mountains. The pure azure sky and the perpetual silence of nature reigning in these uplands add impressions of grandeur which it is impossible to describe. The sense of the beautiful has no gratification in the austere forms of these mountains, but the blue and limpid waters of the lakes, their numerous islands, and the lovely green of the shores, delight it in the highest degree.

133
137 The other eminences perceptible on the horizon lack the boldness of outline seen upon the main ridge, and with their dusky timbers deeply contrast with it. They seem monotonous and commonplace, and people easily impressed by colors will call them somber. The open country, whether marshes, plains, clearings, meadows, or bare hills, presents an extremely bleak aspect, especially when under the influence of a hot summer sun. Its unvarying yellowish hue, produced by the faded condition of the coarse grasses, renders it monotonous.

133 The solitude and serenity of these places exercise a quieting influence upon the visitor accustomed to the noisy scenes of our towns and cities. Noiselessly the brooks and streams pursue their way through the purifying volcanic sands; the murmur of the waves and the play of the water-birds, interrupted at times by the cry of a solitary bird, are the only noises to break the silence. Beyond the few settlements of the Indian and away from the post-road, scarcely any trace of the hand of man reminds us of the existence of human beings. There Nature alone speaks to us, and those who are able to read history in the formations disclosed before him in the steeper ledges of this solitary corner of the globe will find ample satisfaction in their study.

132 The Klamath plateau, though productive in game, fish, and sundry kinds of vegetable food, could never become such a great central resort of Indian populations as the banks of Columbia River. The causes for this lie in its secluded position and chiefly in its climate, which is one of abrupt changes. The dryness of the atmosphere maintains a clear sky, which renders the summer days intensely hot; the sun's rays become intolerable in the middle of the day at places where they are reflected by a sandy, alkaline, or rocky soil and not moderated by passing breezes. Rains and hailstorms are of rare occurrence, and gathering thunder clouds often dissolve or "blow

132 over," so that the running waters never swell, but show the same water level
throughout the year. Nights are chilly and really cold, for the soil reflects
against the clear sky all the heat received from the sun during the day, and
the dry night air pervading the highlands absorbs all the moisture it can.
[342] Winters are severe; snow begins to fall early in November, and in the later
months it often covers the ground four feet high, so that the willow lodges
(not the winter houses) completely disappear, and the inmates are thus sheltered
from the cold outside. The lakes never freeze over entirely, but ice
[241] forms to a great thickness. The cold nights produce frosts which are very
destructive to crops in the vicinity of the Cascade Range, but are less harmful
to gardening or cereals at places more distant; and in Lost River Valley,
at Yáneks—even at Linkville—melons, turnips, potatoes, and other vegetables
rarely fail. The mean annual temperature as observed some years ago
at Fort Klamath was 40.47° Fahr.

000 There are several instances in America where highlands have become
centers of an aboriginal culture. Such instances are the plateaus of Anahuac,
Guatemala, Bogotá, and of Titicaca Lake. They contained a dense
population, more cultured than their barbaric neighbors, whom they succeeded
in subjugating one after the other through a greater centralization
161 and unity of power. The Klamath highlands can be compared to the plateaus
above named in regard to their configuration, but they never nourished
a population so dense that it could exercise any power analogous to
that above mentioned. Moreover, there was no intellectual and centralizing
element among these Indians that could render them superior to their neighbors,
all of whom maintained about the same level of culture and intelligence

TOPOGRAPHIC LIST OF CAMPING PLACES.

361 To form a correct idea of the dissemination of Indians in this sparsely
inhabited country, the following lists of camping places will furnish serviceable
data. The grounds selected by the Máklaks for camping places are
of two kinds: either localities adapted for establishing a fishing or hunting
camp of a few days' or weeks' duration or for a whole summer season, or
[342] they are places selected for permanent settlement. Winter lodges (luldamalåksh)
or slab houses are often built at the latter places; whereas the

only		was hurt.

NOTES.

This is one of the most popular myths current among the É-ukishikni, and we shall find it partially repeated in another myth, recounted by Dave Hill. Aíshish and his father K'mukámtchiksh represent powers of nature engaged in everlasting strife for mutual extermination. In this myth K'múkamtch resorts to the following trick to destroy his offspring. Seeing young larks in a nest on the top of a sorrel-stalk, he informs him, that if he climbs up there, he can obtain a nest of eagles with all its inmates. Gladdened with the prospect of this capture, Aíshish climbs up, but the insidious father causes the plant to grow miraculously fast under him, so that descent becomes impossible, and Aíshish comes near perishing by hunger and exposure.

In the recollection and wording of some portions of the myth my informant was assisted by "Captain Jim."

94, 1–7. The short fragment of a creation myth preceding the Aíshish tale stands in no causal connection with it, and could as well be inserted elsewhere. Myths entering upon the *details* of the creation of the world by K'mukámtchiksh do not, as far as ascertained, exist among this people, but in their stead we have many myths for special creations (of man, animals, islands, mountains etc.). A grammatic analysis of the terms occurring in this fragment (from Lúpí nā'lsh to pátki gí) was inserted by me in the *American Antiquarian*, Vol. I, No. 3, pages 161–166, under the heading: "Mythologic Text in the Klamath Language of Southern Oregon."

[192] [193] 94, 1. Lúpí shutǎyéga is not to be considered as a repetition, for it means: when K'múkamtch began to create the world he made *us* before he made the fish, other animals, and the dam at Linkville. This is, of course, only a small fragment of all the creation myths of this people.

94, 2. shashapkēlía: to tell or count stories, myths or fables in the interest or for the pleasure of somebody; the í is here doubled to obtain a rhetorical effect.

94, 3. K'mú'kamtchish is a contraction of K'mû'kamtch tchish; Aíshish, K'múkamtch also. The longer form of the name of the deity occurs 95, 20.

94, 3. ká-akt, metathetically for kákat; kát is pron. relat. which, what, the thing which. nánuktua ká-akt gǎg comprehends all animate and inanimate creation.

94, 4. wá, uá, to stay, exist, live in; is always connected with an indirect object indicating the place, spot, locality or medium where the subject lives or exists.

94, 4–6. The construction of the sentence runs as follows: Tchúyunk (K'mukámtch) né-ulχa gí'tki gíug páplishash I-ulalónan, páltki tí'wish gint ndûlshámpkash mû' nkillipkash, mû'ash shlé-uyuk; "when a south wind blows, it will stop the waters from [133] rushing down rapidly over the cataract." The outlet of Upper Klamath Lake, called [132] Link River, runs from north to south, over the falls at Linkville; hence a powerful [226] south wind will stem the current of Link River above the falls, leave its bottom dry or almost dry, and enable the Indians to catch the fish swimming in the shallow water or wriggling in the mud. The rocky ledge under the cataract is supposed to be the gift of K'múkamtch.

Frémont also remarked on the scarcity of their horses.[22]

Frémont reached Klamath lake again May 6, 1846. He commented [231]
on the outlet, Link river, "this is a great fishing station for the
Indians." His statement on the distribution of their settlements [226]
coincides with my information.

> They have fixed habitations around the shores of the lake, particularly at [361]
> the outlet and inlet [Williamson river], and along the inlet up to the swamp
> meadow [Klamath marsh], where I met the Tlamaths in the winter of '43-'44, [131]
> and where we narrowly escaped disaster. . . . . The Indians made me under-
> stand that there was another large river [Williamson river] which came from [133] ●
> the north and flowed into the lake at the northern end, and that the principal
> village was at its mouth, where also they caught many fish.

Frémont's party made a circuit of the lake. It is curious that he
does not mention the settlements about Pelican lake on the western
side, which he could hardly have avoided. On the other hand it is
not clear how closely his memoirs follow his diary. Attacked while [726]
on the western side, his party reciprocated by raiding a village on the
opposite side, perhaps one of those on Williamson river just above
the present highway bridge.

> Behind the sage-bushes where they had taken their stand every Indian had
> spread his arrows on the ground in fan-like shape, so that they would be ready
> to his hand. . . . . Quantities of fish were drying, spread on scaffolds, or hung [252]
> up on frames. The huts, which were made of tall rushes and willows, like
> those on the savannah above [Klamath marsh], were set on fire, and the fish [342]
> and scaffolds were all destroyed.[23] [726]

The first invaders remembered by the Klamath came from the
north about 1835. The stories about them have now a legendary flavor. 173
The first group was mounted; the Klamath dubbed them mpĕ'tkoŋks 437
(from mĕtc!a', to pack about) from their roving habits. An alterna- 648
tive name, pásai'ūks (French-Canadian in Chinook jargon), more
surely identifies them. During their brief stay at the mouth of
Williamson river they bought fat dogs of the Klamath, which to the
latter's amazement, they ate. For these they gave buttons and metal
disks with a central perforation (wika'lkal).

Almost as early was a white contingent moving northward on the 173
west side of Klamath lake. The Indians watched them unseen. They 648
were impressed with the horses, axes, and the food of the whites. 177

173 When the latter broke camp they left behind a little flour, which the
177 Indians carried home and divided. They rubbed it on their palms and
[302] smeared their faces.[24]

648 Other early whites came from the southeast on horseback. This
marked the beginning of the great migration by way of the Modoc
648 country to the Pacific slope. On the whole the Klamath came off
remarkably well in their relations with the whites. The full brunt of immigration was borne by Modoc and Pit River peoples. The Klamath were spared the Oregon wars of the fifties, which all but annihilated the tribes of western Oregon and northern California.[25] The earliest white settlements in the neighborhood were about the present Jacksonville, Medford, and Ashland. The first white settlement within Klamath territory was near the village of kowa'edi at the northern end of the lake. This was about 1860–65, hence may have reference to the first agency established there. Subsequent relations have been on the whole quite amicable. The Klamath took no part in the Modoc war of 1872–73.

Habitat

131 The territory of the Klamath is on the high plateau of eastern
133 Oregon, in the shallow basin wherein lies the group of lakes that give
rise to Klamath river. The southern half of this basin about lower Klamath and Tule lakes is Modoc territory, extending southward across the lava beds in the direction of Pit river. The northern half, which lies against the Cascade range, is the home of the Klamath.

The Klamath properly reside on Klamath lake (or as it was
formerly known, upper or middle Klamath lake), on Klamath marsh,
[361] and on Williamson river, which connects them. At least, most of the
permanent winter settlements are on these three waters, with a scattering on their tributaries. Summer camps are established over a much wider territory, as far, it would seem, as the natural limits of this drainage area.

---

[263] [24] Salt was equally unknown to them at this time.

[25] A somewhat obscure account was given me of the inclusion of Klamath in
[174] the great round-up of western Oregon Indians on Siletz (?) reservation in the
fifties. These had been wintering at the Dalles and were herded with the
Indians there. The Upland Takelma and Molala were penned in together and
[648] fed by the soldiers. Some died every day; the Klamath suspected that they
were poisoned. The Klamath were kept apart, and, thanks to the strenuous
arguments of their chief Lale'ks, were not only freed but supplied with beef
and an escort of soldiery to conduct them back to their own country.

Map of Klamath territory.

101
The western and southern limits of the range are easiest to define 131
because of the topography and the proximity of other tribes. To the
east and north the open deserts and broken country extend indefinitely. 133
The nearest of the shifting settlements of Northern Paiute on the east
at Goose and Summer lakes are sixty and more miles from Klamath
lake. Those of the Warm Springs tribes are one hundred and fifty
miles distant, more than halfway across Oregon. Teit's data show [175]
that more than a century ago the neighbors of the Klamath in this
direction were the Sahaptins at no great distance and beyond them
Molala and Cayuse.

The wide plain south of Klamath Falls seems to have been unoccupied. 101
The Modoc lived south of the Lost River hills about Tule lake
and on lower Klamath lake. My Klamath informant doubted that 131
they lived on Miller lake, or had permanent settlements on Lost river. 174
Both tribes congregated at one place only for the early spring fishing,
namely on Lost river, a mile or more below the buttes at Olene. The [226]
Klamath camp site is on the north bank, the Modoc on the south.

The southern boundary of Klamath territory skirts the Klamath 101
valley from this place as far downstream as Spencer creek, near the
California-Oregon line, below the canyon of the Klamath. Below this 131
on the river are the Shasta, whose northernmost outposts are on Shovel
creek and north of the river on Jennie creek. The Klamath have no [226]
settlements on the river, but fish, hunt, and gather roots at such points [224]
as Keno, Spencer creek (ma'lbuk'is), and at laik'ēlmi, five or six miles [222]
upstream from Dorris (?).

The western boundary is the Cascade watershed, including, however, territory on the northwest side of Mount Pitt (Mount McLoughlin) and again southwest of Crater lake. The Klamath hunt northwest of this conspicuous mountain in a region of many streams called la'ndjli (possibly an American name). Fifteen miles southwest of Crater lake is Huckleberry mountain (iwumkā'ni, huckleberry place) where the Klamath meet the Molala similarly engaged in berry picking. The latter regularly occupy the highlands of the upper Rogue river drainage above Trail creek or some point below Prospect. These Molala form a southern extension of that tribe from the upper Umpqua drainage.

The northern and eastern boundaries are somewhat indefinite. Palmer stated:

in importance to fish. Summer is also the time of travel and trade, 221
taking people as far as the Dalles where they may elect to spend the
winter. Winters are exceptionally severe at this altitude (4000 feet), [132]
with deep snow and lakes, marshes, and even streams solidly frozen.
Movement is stopped and unless a winter residence has been chosen [133] •
which gives some possibility of fishing, starvation may be faced before 221
spring. These winter sites are in sheltered, sunny spots on running 361
streams or at springs warm enough to prevent ice from forming. The
families return in the fall, rebuild the earth-lodges from the remains [226]
of the previous year's structure, and are all snugly housed by mid-December. The only permanent settlements are the winter villages.
The summer residences are shifting, and while reoccupied from year
to year, there is no feeling that particular camping localities belong
to certain groups. The summer camps are rather indiscriminate aggre- [628]
gations of any Klamath, but the winter locations are so fixed of habit
as to give a measure of political separatism to the several localities.

The case of Tom Lang's family is typical. Their permanent winter home is at iu'laloŋʞ, a large village on the west side of Link river at the foot of Klamath lake, hence Tom is considered one of the southern lake people, iu'ˈlaloŋkni generically. His family is accustomed to move for the spring fishing to ditk!aks, Barclay spring, or to Modoc point, both on the east side of the lake, where they erect temporary lodges. Crossing the lake to dö'ktcoŋks they leave their canoes and travel overland to woksa'lks on the north shore of Wokas marsh. Here Tom was born in July. When the berry and wokas harvest is ended they retrace their steps and take canoe to Algoma to pick wild plums, berries, etc. From there they drift back to their winter home.

The towns for the most part lie along Williamson river, on the
southern side of Klamath marsh, and along the eastern shore of Klamath lake. As these are winter settlements, the open lake is avoided,
and occupied only where warm springs outweigh its disadvantages.
They cluster along Williamson river whose sheltered valley is dis- [133]
tinctly warmer than the lake front a few miles distant and where the
running stream contains fish most of the year. [132]

The towns are not isolated, compact groups of houses, but stretch
along the banks for half a mile or more. In fact, the settlements on 361
Williamson river below the Sprague river junction form a practically 342
continuous string of houses for five or six miles, the house pits being,
in many spots, crowded close together. Informants insisted that
many of these were occupied at the same time. When we consider
that these earth-lodges may have housed several families, there is
strong suggestion of a considerable population.

Fig. 2. Settlements in northern Klamath territory. Triangles represent cremation piles; rectangles, mourners' sweat-lodges.

[p. 12]

21, ḳ!o'ltawas, a town of ten or fifteen earth-lodges on the left 103
bank, with houses on the right bank extending to the next settlement 131
downstream. There are otter (ḳ!olt) holes in the right bank, hence 361
the name. A mythical otter that lived here is seen in a rock standing [823]
in the water; on his back are his children, smaller rocks.

22, at'awlke, "to catch fish in still water," six to a dozen houses [226]
on the right bank; a *few* on the left. The water here is quiet; fish are
caught with the trolling net.

23, ya'ak (ya'ac, willows), two dozen or more houses on the right bank. This was the largest river site in early reservation days, the road from Link river (Klamath falls) fording the river here. Of three house pits together, with their margins nearly in contact, two are twenty-five or thirty feet in diameter, the other fully five feet more. A cremation pile stands on the hill above this town. It is now leveled by marauders, as are all the others in this country, but it apparently covered an area forty feet in diameter.

24, tsa'k'wi, houses on the right bank with a few on the left.

25, wită'mŭmpsi, bear's place (wită'm, black bear). This is a [823]
high bluff on the right bank above an eddy in the sharp bend in the
river; the scene of vision questing. A large shaman's earth-lodge is [756]
located here. Fish are caught all year long above this town.

26, goyεmske'εgis, crawfish crawl out, or kiεke'trŭs, small lizard, [226]
a town half a mile long beginning a quarter-mile above the highway
bridge. The houses are on the abrupt slope right to the river's brink,
and some on the little bluff above. There are pits of perhaps forty or [343]
more houses here, but at least half are dome-shaped cooking houses,
for they are for the most part only six to ten feet in diameter, with
few as much as fifteen feet. One of eighteen feet has its dome-shaped
kitchen lodge clearly indicated on the north side.

27, wεla'lksi, named for a big quaking-aspen (wεla'l) there, is on the eastern shore of Agency lake. A few ă'ukckni live here in winter, in five or six small houses.

28, loḳ'o'gŭt, warm, a little warm spring near which are two houses [133]
on the higher land near Agency lake.

29, tcō'klalŭmps, service berry, which grows here abundantly, is a town of one or two small houses overlooking the lake where the Chiloquin road meets the lake highway.

Other towns may have been at ya'mzi, on the western side of Yamsay mountain, and ḳokenă'okε, Spring creek, a large northern affluent of Klamath marsh.

1: Spier E-4,5 (1925-1926) 1930
(ca. 1860-1900) NR10 Klamath NR10

103 131 361 II. *Agency lake group* (*kowa'cdikni*).—The winter home of these people is on Agency lake, the northern arm of Klamath lake. My questioning did not make it wholly certain that this group is independent of ă'ukekni. In fact they join them at k'ᴇtai'di (19) on Williamson river for the spring fishing.

[756] [226] 44, kowa'cdi is close to the mouth of Wood river. The site is a quarter-mile long. One informant stated that it contained twenty houses, another two earth-lodges (one a shaman's), not incompatible statements. A spring here permits fish to remain all winter. A few houses are at another spring a quarter-mile east.

• [133] III. *Lower Williamson river group* (*du'kwakni*).—These settlements are close to the mouth of Williamson river. This region, du'kwa, is one of marsh, separated by a considerable section of open and higher plain (pᴇnŏ'ŋs) from the nearest ă'ukekni settlements. Pᴇnŏ'ŋs seems not to have been occupied in pre-reservation days, although du'kwakni and ă'ukekni now live there. Du'kwa people seem also to live across the lake at Pelican bay, the home of the gu'mbŏtkni. But whether this is a regular thing, or only a matter of my du'kwa informant's [222] personal history, I am not sure. At any rate they go to dig roots in the marshes of the western and northern sides of Klamath lake in summer, not to Klamath marsh. Their winter settlements are on the isolated bits of higher ground within a mile of the river mouth, and on the marsh front immediately south. Most of these settlements, too, are on the right bank of the river.

30, mo'aķsda, five or seven earth-lodges on the left bank nearly a mile above the mouth. Five more houses stood on the opposite bank with numerous springs behind them and the du'kwakni cremation pile a half-mile above.

31, wickămdi, four or five houses on the right bank below this, one or two a little below, then a cluster of four and another of two farther downstream.

32, la'wa'lstŏt, three houses on the point forming the right side of the river mouth.

33, mo'giŋkŭnks, the largest settlement in this district with five or six earth-lodges and as usual a number of small structures. This is on the left bank a quarter-mile above the mouth. One or two houses are on this side immediately at the river mouth.

34, djiŋgŭs, four or five houses at a spring on the lake front to the east of the mouth, with one or two more farther in the marsh.

side of Wood river in much the same locality. These may be the 103
same site. 131

V. *Klamath Falls group* (*iuʺ laloŋḳni*).—All the people of the lake
from Modoc point southward are named for their principal locality, 361
iuʺ laloŋᴇ, Klamath falls. Despite the large area, they are relatively few in number. In summer they resort to the marshes west of the lake or fish on Lost river. The district along the eastern shore of the lake from Modoc point nearly to Algoma is called neʺ luḳai (neʺ luḳs, a late sunrise), from the circumstance that a low mountain here cuts off the morning sunlight.

45, kᴇt!ai'ksi, point of rock, a promontory two miles or so northwest of Modoc point, is their northernmost settlement.

46, suwiakă'ĕks, jump over, is a large village at Modoc point. It extended on both sides of the headland and for three-quarters of a mile south. The place takes its name from a large rock (about three and a half feet high) which stands a half-mile south of the point. It was a trial of skill to run uphill and jump over the rock. Bare island (au'emi) opposite is their camp site, and has no permanent settlements.

47, iulă'u, promontory, is a fishing village occupied in early spring. Pictographs are painted on the rock slide north of this.

48, diu'wiaks (named for its little spring, di'wik) is a winter
settlement at the railroad point Ouxy. Little fish ran in the spring [226]
early in the year.

49, ḳau'ömöt, a half-mile south, is, like all these lake sites, crowded along the foot of the mountain on the lake shore. There are many
earth-lodges about a large spring here. The lodge rings are so clear [172]
that this would be a good place for archaeological excavations. Its name is from ḳau'öm, a place where fish run.

50, dI'tk!aḳs, boiling spring, is now known as Barclay spring. [133]
There are many earth-lodges north and south of this. Two cremation piles are to the north on the highway, one distant a hundred yards on a rock slide, the second twice as far and directly on the southern boundary of the reservation. Unlike the cremation piles on Williamson river, no glass beads or iron was to be found at this second site.
South of Barclay spring by three hundred yards is a deep nameless [231]
spring into which pups are thrown to train them for hunting. A large
sweat-lodge used by mourners is situated at the foot of the slope near [343]
the angle of the marsh east of Algoma.

361 at the lake's edge, large and warm enough to prevent ice forming over a large area. Winter is severe at this altitude (4000 feet), snowdrifts [132] are deep, and Klamath lake freezes over to a depth of some ten inches in late December. Such sheltered valleys as that of the Williamson • [133] river, while but a few miles from the open lake, are distinctly warmer.

The annual cycle of activities is dictated largely by the food 221 habits. It is customary to leave the winter villages in April or May, when plant growth is well under way and the flat valleys have dried, not to return until the snow falls again and houses need refurbishing. When fish begin to run in the spring, the Klamath congregate at the fishing places to stay for two months or more. For example, some join the Modoc on Lost river for several weeks to catch and dry fish. The spring and early summer are spent on the marshes and prairies, gathering roots such as camas and ipos. When the camas has been dried and stored, they move to the marshes, especially to Klamath marsh, to harvest pond-lily seeds from mid-August to the end of September. While the women are busy with this harvest, men hunt mule deer, antelope, and other animals whose habitat is in eastern Klamath territory. Late summer and autumn, seeds, berries, and nuts are gathered, the Indians congregating where these are plentiful. Many of those at Klamath marsh, for example, move directly to Huckleberry mountain, southwest of Crater lake, to garner these [484] berries. Summer and autumn are the seasons for journeying to visit and trade, for raiding, and especially for laying up a store of fish [726] against the coming winter. It must be understood that the winter [251] locations are not completely abandoned during this season, for many of them are favorably situated for these very activities. But it is [361] customary for such a group as the äukekni division, whose winter residences cluster thickly along the middle Williamson river, to scatter and meet again at Klamath marsh for the pond-lily harvest in [805] August and September. (This is the beginning of the Klamath year.) They begin to return to the winter sites in the latter month, to start [342] rebuilding the earth-lodges for the coming winter, a task completed in December, by which time full winter is at hand.[219]

501 The move to Klamath marsh of the people at the mouth of William- 221 son river, the du'kwakni, can be made by canoe only as far as ya'ak on the middle river, where they join the äukekni in packing afoot the rest of the distance. When the water is high, canoes can go upstream as far as bɛzūkse'was at the mouth of Sprague river (see the maps,

---

[219] See also Gatschet, 1:74–77.

used;[373] then grass or pine boughs, covered with dirt, are heaped halfway 342
up the side. The outer mats are held in place by tying them along
the edges to poles propped against the side of the house. The rope
(pěķ'os) used for this is three strand, braided of grass or the outer
layer of tule. In placing the mats, a space about two feet across is
left at the top for a smoke hole, and another only three and a half feet
high for a doorway. One has to stoop to enter. The door is a mat like
that of the summer house; it is not weighted nor tied down.

Drying racks are not placed inside the houses. All fish and meat [251]
are dried on racks near-by. [417]

Houses are not decorated, nor are the house posts carved or painted
except by shamans. These may paint them with horizontal stripes, 342
alternately red and white. One informant had it that men's faces,
snakes, lizards, and various other animals, not spirits, are painted on
the posts, but I am doubtful. Shamans also hung stuffed bird and
animal skins about the interior. A wooden image and a stuffed crane [756]
skin are set up outside on the northern side of the hatchway, i.e., above
the shaman's bed. Houses are not given individual names, Yurok 552
fashion, though the localizing tendency of the Klamath might have 171*
found an outlet in this.

The fireplace (sne'lūķs) in the earth-lodge is in the middle of the 354
floor, between the four center posts and under the open hatchway.
Neither a pit nor stones are used to confine the fire. Most of the time
there is no fire on the hearth, only in the morning and evening; at
other times the hatch is closed. A huge fire is built when it is nearly
sundown, and after the mat is drawn across the opening the heat is so
great that blankets may be dispensed with. This despite the severe [132]
winters; at this altitude (4000 feet) lakes and streams are frozen
solid. Fires are usually made by piling short lengths of wood in log- [133]
cabin (crib-work) fashion to a height of eighteen inches. They cook
when this is reduced to a bed of coals. A piece of rotten wood is
ignited to carry fire from one place to another.

Cooking ordinarily takes place outside the dwelling in a dome- 343
shaped house (sti'nā'c) erected near-by. An earth-lodge on lower 252
Williamson river, for example, set some fifty yards from the stream,
had its cooking lodge close to the bank. All the women of the household 592
prepare their food together, even where several families have
joint tenancy. It is carried to the earth-lodge and there passed about

---

[373] Barrett gives the successive layers as made of "a kind of reed," triangular-stemmed tule, and circular-stemmed tule (*op. cit.*, 244).

805 dino'löpka, later forenoon.
siwö'tkn, midday.
gawilo'la, mid-afternoon.
dī'atkn sa''bas, sun nearly down.

The movement of the stars gives time at night. For instance, I was told that in winter, when they sit late telling stories, it is bedtime (lo'lalöks) when Orion's belt has risen two-thirds of the distance toward the zenith. This is about ten o'clock in mid-December. Midnight is literally (?) psīndötklüm.

There is no year count, but these people have of course no difficulty in expressing spans of years. Similarly the seasons are of little significance. There are however four period names: sz'a'lüm, the beginning of fall, lo'ldöm, winter, when snow begins to fall in the mountains, sko'w'a, the beginning of spring, pö'tda, when roots, etc., begin to ripen. It was emphasized that these names refer properly to the opening of the seasons. There is no generic word for seasons; the year is called momo'wate or e'lo'la. Gatschet observes that as an alternative to the use of month names, they reckon time by the seasons in which natural products are harvested, as udsaksä'mi, "in the big sucker time," i-umä'mi, "in the berry season," etc.[403]

This seasonal count indicates that the year begins in early fall. It is marked by the end of the wild fruit season and the withering of the leaves. This corresponds to late August or early September.[404] The exact date is indefinite; it is marked by the appearance of a new moon, but bears no relation to the procession of the constellations.

Ten months are named which purport to pass for lunar months. That is, the Klamath month (sa''bas, month, moon, sun) is a period indefinitely fixed in the solar calendar, marked by the waxing and waning of the moon, and omitting the dark phases. These people are fully aware that ten named periods do not fit the twelve plus lunations of the year. No attempt is made to make them fit, to reckon an intercalary period. The ten months are merely ten roughly marked intervals of the year-round, whose beginning, duration, and end are left indefinite as of no particular concern, but which serve the convenient purpose of designating the several periods of the year. It is quite clear that while the Klamath are fully aware of the discrepan-

---

[403] Gatschet, 1:76.

[132] [133] [404] It must be remembered that winter comes very early at this altitude (4000 feet). By mid-September ice forms on the ponds during the night. Gatschet's information confirms that of my best informants that August-September marks the opening of the year (1:74). This disposes of mid-winter and February-March as opening dates as mentioned by my other informants below.

[P. 3]

The Aboriginal Klamath-Modoc

EASTWARD FROM THE LOFTY CASCADES OF WASHINGTON AND OREGON 133
stretches the elevated and broken country of the central
Plateau. Across its face, rivers carry waters from northern water-
sheds and the slopes of the Rockies and, cleaving the mountain
barrier, flow to the sea. Upon the ladder of their waters, the hom- 136
ing salmon mount in seasonal surges to spawning grounds far to
the interior. It is a province once richly endowed in game, and,
early in the peopling of the New World, the Indian found it. In 172
the period toward the end of the Pleistocene period, while the 133
glaciers ebbed upon their centers, some eleven thousand years
ago,[2] some of his numbers camped along the Columbia, at the head of an estuary that in those days extended upriver to The Dalles, and left behind antler combs, stone bolas, blades, and the obscure and humble bric-a-brac of the camp. Further upriver, in the open lands of Lind Coulee, others hunted the bison. Below and east of the Plateau, unnamed tribesmen camped along the Pluvial lakes of the Great Basin, whose waters, now gradually drying up, attracted the waterfowl and animals that in turn drew the hunter. In the timeless dessication of its caves, at Fort Rock, Danger, Gypsum, and Lovelock their sandals, basketry, and spear-throwers have been found.

Along the southwestern flanks of the Cascades, a great fault had formed a crescentic trough some one hundred miles in length by twenty-five in breadth. Rivers and creeks fed marsh lands and broad lakes within this great highland and created an earthly paradise for the early hunter-fishermen. Their initial entry has been estimated at about ten thousand years ago, and by the time

K 172 133 the eruption of Mount Mazama created Crater Lake and strewed its pumice in thick beds over the countryside, some 6,500 years ago, they had long been in occupation.[3]

K M 101 172 Here, with the passage of time, the peoples later to receive the names of Klamath and Modoc began to take on their present way of life. Their cultural position was at once peripheral and strategic, for they lay at the boundaries of the emergent cultural provinces of the Great Basin, the Plateau, and California, and though they stemmed fundamentally from the Great Basin, they were also subject to influences flowing from California and the Plateau. Consistent with their relative geographical position and ecological resources, the Modoc diverged toward California and the Klamath toward the Plateau; and when in turn the influences of the North Pacific Coast—extending from southern Alaska to northern California—reached them, it was again the Klamath who were somewhat more receptive. Despite their differences, the two peoples retained a substantial common base: they spoke dialects of the same language and felt their political separation to have been a recent event.[4]

K M 101 197 Indeed, the linguistic evidence is consonant with a long autochthonous development within this region. Klamath-Modoc finds its closest linguistic congeners within the Plateau, in Cayuse, Molala, and the northern Sahaptin Tenino, Klickitat, Yakima, Umatilla, Walla Walla, and Nez Percé. Taken together, these languages are seen as more distantly related to others spoken in Western Oregon and in the Sacramento-San Joaquin drainage of California, and like them are assigned to the Penutian phylum.[5] (See Map of Tribal Distribution in Oregon.)

K 133 226 361 433 For the Klamath, the dominant features of their landscape were the marshes and streams, with their rich resources of fish, mussels, and waterfowl. Their winter settlements, fringing the shores in settled places, were located where fish could be caught most of the year, clustered densely upon Klamath Marsh and the eastern shore of Agency and Upper Klamath lakes, extending down to Link River. They lay as well upon the Williamson River which runs in a bow some sixty miles, passing through the Marsh to empty into Upper Klamath Lake, and upon its eastern tributary, the Sprague. In their more open country to the south, the Modoc were less favored and less open to influences from fishing peoples,

[Klamath Reservation]

K
M middle Columbia, far below the Coast and California, and in turn
161 considerably above the Great Basin.[6]

000 The mind's eye, drawing upon descriptions of early explorers and modern ethnographers,[7] can recreate the life of the early nineteenth century. It is a life that moves through a succession of activities with the seasons, each characterized by a community of different size and constituency. On a miniscule scale they resemble the "task groupings" which Anastasio has analysed in the intertribal relations on the Plateau.[8]

K During the long winters, existence is centered in the permanent
M settlements, for the altitude of the Klamath Basin is over four
221 thousand feet and snow often drifts deep. An accrued depth of
132 six to eight feet is common; while in the exceptional winter of
133 1890-91 a figure of thirty feet, undoubtedly in drifts, was recorded
361 at the head of Agency Lake. Crude, circular bearpaw snowshoes
481 provide a poor means of winter travel, and the settlements tend
262 to become isolated; most people are forced to remain in the villages, supplementing the meager winter catch with stores of dried fish and meat, roots, seeds, and berries.

K From a distance, the winter settlement has the appearance of
M hillocks strung out along the bank or clustered in a sheltered
221 spot. In size it may range from several score houses—there are
361 perhaps a hundred house pits at one favored site on Klamath
342 Marsh, though not all may have been occupied at the same time
—down to tiny hamlets of one or two earth lodges and a few mat
huts.[9] Within the village, the earth lodges are the dominant struc-
K tures, with the domed huts flanking them. In Klamath settlements,
M communal storage pits shelter the bulk of supplies; but the
343 Modoc prefer to conceal foodstuffs in household caches some
251 distance from the houses.

One Klamath woman recalled her childhood hamlet, part of
K a settlement totaling roughly two dozen houses,[10] on the lower
361 reaches of the Williamson River. Here she and her parents lived
342 with her maternal uncle, the shaman later known as Alex Wilson,
whose earth lodge was the largest in the hamlet. Nearby was
another lodge, the residence of Hunter Wilson, brother of Alex
and headman of the family group. Some four or five mat-covered
K lodges and huts stood in the vicinity, the larger ones closer to
[343] the water for cooking and the sewing of tule mats, the smaller

The Upper End. This is a view of the eastern side of the reservation, taken from a vantage point near Beatty, looking east.

[P. 48-A]

> *657 177 241 a mere change of externals, yet the white man's ways as the red man understood them were adopted with a rapidity unequalled in most Indian tribes. . . .
>
> The vegetables grown that first year [corn, beans, turnips, carrots, peas, potatoes, artichokes, and onions][1] were a revelation and a delight to the Indians, who had previously lived so largely on small native roots. I have heard my father say that they were particularly captivated by beets which, with their red juice, they thought resembled "ittle-willy" [meat].[2]

In the effort to induce the Indians to cultivate their fields, the Agent seems to have enlisted the aid of the military. "I had about one-half acre broken for Blow," wrote Captain F. B. Sprague, "and he is at work like a white man, has it all fenced and cetera, & plants growing finally."[3]

The crops the first year were reported good, but subsequently
• [133] [132] they were killed by frosts or summer droughts. The elevation of the Klamath Plateau, some four thousand feet above sea level, limits farming even today. Reports are studded with the phrases, "heavy frosts," "unprecedented heat," "unusually dry and frosty." Surveying the blighted fields, the early Agents redoubled their efforts. In 1869, Applegate reported that "the teachers . . . have been for a greater part of the time engaged on the farms, along with Indian boys receiving instruction in manual labor. . . ." R. B. Hatton, schoolteacher, stiffly pointed out that he "was instructed to labor on the farms . . ." and the tenor of his remarks suggests that in so doing he had been diverted from what he considered his proper function.[4]

*657 *648 177 231 241 The following year, the new Agent, Captain O. C. Knapp, stated, "I again urge upon the Department the uselessness of trying to make this an agricultural reservation. . . . The Indians should be supplied with cattle and sheep, and they would soon become self-sustaining."[5] His words were echoed by Agent L. S. Dyar, in 1872: "These [crop] failures are very discouraging to the Indians as well as to the Agent, and demonstrate the necessity of paying more attention to the raising of cattle. . . ."[6]

*657 177 241 Nonetheless, from 1871 on, with the aid of the farmer, several Indians cultivated little farms along the Williamson River and the lake shore.[7] These in the following year amounted to some twelve to fifteen individuals who "have small patches of land of a few acres each fenced, on which they have, with the help of

5: Barrett E-5 (1907) 1910
NR10 Klamath NR10
Modoc NS17

M
K situated about upper Klamath Lake and in the mountains to the
101 east; except for a part of the Modoc in Oklahoma. It is the
131 object of the present paper to discuss briefly the conditions of
M aboriginal life among these people, due consideration being given
K their natural environment and the influence of surrounding
128 peoples upon them.

TERRITORY.

M The territory occupied by the Klamath Lake and Modoc
K Indians lies chiefly in the drainage basins of Upper and Lower
101 Klamath lakes and Tule or Rhett lake. From a point near the
131 confluence of Keen creek with Klamath river the western boundary
of their territory probably extended along the watershed
separating the Klamath lake and Rogue river drainages, to the
K foothills of the mountain in which Crater lake is situated. It
823 should be noted, however, that the Klamath, while they feared
Crater lake, did go upon certain occasions to the lake and seem
not to have been molested there by other Indians. It would seem
that the lake was looked upon as a sort of territory of mutual
rights by the peoples in its vicinity. They visited it when they
desired to acquire great merit in hunting or other pursuits in
which supernatural power was necessary. To go and bathe in
this wonderful lake was a brave thing to do, and made a man
lucky for hunting or other similar pursuits and made him very
K strong for war. It would appear that the relations formerly
131 existing between the Klamath and the people of the Rogue river
648 drainage were not at all friendly, so that the Klamath seldom
ventured as far west as the crest of the range. They did on
occasion make up large parties and go up to the crest of the
range for the purpose of hunting, but small parties rarely ventured
so far. The region for some distance to the west and
northwest of Crater lake was also visited by the Klamath for the
K purpose of gathering berries in season.

101 On the north the boundary extended as far as to the head-
131 waters of Deschutes river, thus including the whole drainage
133 basin of Klamath marsh.[1] On the east the boundary probably

---

K
[101] [1] The Bureau of Ethnology's map in Bulletin 30 gives to the Lutuami
[114] territory as far north in the Deschutes drainage as latitude 44. See also volume I of this Bulletin, 779, 1907.

extended far enough to include the drainage into Sycan marsh, 101 and thence on toward the south, passing several miles east of the 131 town of Bly and including the whole of the Sprague river drainage.[1] 133 The southern part of the eastern boundary probably passed somewhat east of Clear lake and around the head of Lost river. The southern boundary was probably the divide between the drainage of Klamath and Rhett lakes and that of Pitt river.

The Lutuami[2] are divided into two slightly different dialectic M divisions: the Klamath Lake, usually known simply as Klamath, K occupying a comparatively large territory about Upper Klamath 101 lake, the northern part of Lower Klamath lake, Klamath marsh, 197 and the region to the east; and the Modoc, occupying the region about Rhett lake and the southern end of Lower Klamath lake. One informant mentioned a third dialect, which he said was spoken by the people formerly living on Link river and about Linkville or what is now known as Klamath Falls. In view of the slight lexical differences between the Klamath and Modoc dialects, it seems very probable that if a third linguistic division did exist it was inconsiderable and not more than a sub-dialectic variation. At any rate the only linguistic units recognized by the people themselves are the two dialects spoken by the Klamath and the Modoc. The fact that the two divisions speak slightly differently, does not seem to appeal to the people themselves so much as the fact that they were in former times politically disunited, and were in fact, upon certain occasions at least, at war.

As nearly as could be determined the boundary between the M Klamath and Modoc territories extended through the northern K

101

---

[1] This is the boundary generally claimed by the Klamath. One Paiute 131 informant, however, claimed that the territory of his people extended as far west as Yam Say peak and the Black hills, thus including Sycan marsh in the Paiute country. Like Klamath informants he stated that the boundary passed a few miles east of Bly.

[2] Gatschet, Contrib. N. A. Ethn., II, gives Lutuami as meaning lake, *i.e.*, Tule lake, in the Achomawi or Pit River language. The people have [114] no name for themselves other than maklaks, person, Indian. Maklaks is possibly the source of our word Klamath, the origin of which is un- [113] known. The Klamath Lake people are called in their own language Eukshikni maklaks or Eukskni maklaks, at the lake people, from Eukshi, which denotes specifically Klamath marsh, but also the adjoining country, including the eastern shore of Upper Klamath lake. Eukshi appears to be derived from eush, lake. The Modoc are called Moatokni maklaks or Modokni maklaks, in the south people, from moatak, Tule lake. Moatak is a derivative from muat, south.

M clusion of almost everything else. The seeds of this plant,
K gathered and preserved in three different manners, as described
13 in detail by Coville,[4] form the staple article of food and thus
correspond to acorns used over the greater part of California.
About Tule or Rhett lake and the smaller lakes of that vicinity
there are fewer marshes and consequently a smaller supply of
the water-lily. Thus the Modoc were much less abundantly supplied
with this staple than were the Klamath, who are said to
have had on Klamath marsh alone over ten thousand acres of
these plants. The chief vegetable food of the Modoc seems to
have been tubers and bulbs, notably camass and ipos.

M The extensive lakes of this region naturally bring great num-
K bers of water birds of various kinds, including swans, geese,
136 ducks, and wading birds, the majority of which were used by the
Indians as food and in various ways. The skins of swans, geese,
and other birds with especially fine down, were made into
feather blankets, swaddling clothes, etc. Fish were abundant in
the lakes, salmon and salmon trout being especially esteemed by
M the Indians. The presence of this large supply of water birds
K and fish developed certain specialized implements for their cap-
223 ture. For taking birds there were what may be termed a ring-
M pointed arrow, and a special net. There were several methods
K of taking fish, the most important being by the large triangular
226 dip-net used in the dug-out canoe, as shown in pl. 10.

501 The country provided also an abundance of the usual animals,
M such as deer, elk, antelope, and others used for food; and coyotes,
K gray wolves, foxes, badgers, wildcats, rabbits, and various fur-
136 bearing animals furnishing blankets and clothing.
237

BUILDINGS.

M The houses of the Klamath and Modoc were of two kinds. In
K this region where the snow on the higher peaks is always in
342 sight, and where it often reaches a depth of several feet in winter,
● [133] a warm and durable house is necessary. This was provided by
[132] the semi-subterranean earth lodge, which was of the usual central
California form, and had a pit from a foot to three or four feet

more acute than that at the stern. These canoes are from twelve to thirty feet in length but are very narrow in proportion, usually ranging between twenty and twenty-six inches in width. The opening of the canoe extends its full length and is usually two or three inches narrower than the full beam. Usually not over a quarter and never over a third of the log is cut away in making the canoe, the remaining three-quarters or two-thirds being then hollowed out to a thin shell varying from half an inch to a couple of inches in thickness, except at the prow and stern, where the thickness is considerably greater. The stern is somewhat thicker than the prow. The canoe is loaded with its greatest weight aft, which causes the prow to project considerably out of the water, and makes the canoe much easier to propel. This is carried to so great an extent that in the case of a single paddler in a large canoe the prow points upward at an angle of perhaps fifteen degrees from the surface of the water. When there is a second paddler, he kneels near the middle of the canoe, unless he is fishing or doing other work which requires that he be at the prow. The prow has always a somewhat greater overhang than the stern.

To propel a canoe one paddle each is required by the occupants. These paddles, always of cedar, vary in length from about three to five and a half feet, have handles an inch or so in diameter, and broad, very thin, blades. The paddle is dipped vertically and noiselessly, no pull being given until the blade is completely covered by the water. To lift it from the water again it is turned on its edge so that the width of the blade is almost parallel with the length of the boat. The handle of the paddle very often strikes the side of the canoe and in this manner, particularly at the stern where most of the paddling is done, the side of the gunwale is worn very smooth, showing a polished surface or even a notch, particularly on the right side of the older boats. Paddling is the ordinary method of propelling a canoe on deep water, for all such purposes as fishing, hunting, and general transportation. However, another and specialized implement is used, especially in wokas gathering. The water on the wokas marshes is shallow, rarely more than a couple of feet in depth, and the bottom consists of soft black mud completely

Modoc NS17

interlaced under the surface with the strong large roots of the water-lily. A pole of varying length is employed on these marshes and wherever there is occasion to travel over shallow water. The lower end of this pole is split for from four to six inches, and the two prongs thus made are turned sharply apart so that the angle between them is often as great as forty-five degrees. In this angle is set a small bar of bone or hard wood, thus making a cross-bar near the tips of the prongs. In pushing through the soft mud, the pole, on account of its split end, usually does not sink far before it strikes one of the strong roots of the water-lily, which then bears the stress of poling. Even if the pole does not strike a water-lily root, it sinks into the mud much less readily because of its split end.[7] M K 501 222 [133] •

One of the most interesting devices connected with fishing is the large triangular dip-net used on the open water of the lakes or the larger deep streams. This net is used on a pair of poles held apart by a cross-bar near the vertex of the angle formed by them. The net itself is attached to the poles at the sides and to this cross-bar at the rear, the tips of the poles being connected by a strong string upon which the front of the net is fastened. The method of manipulating this net is shown in the series of figures in pl. 10. Only one man appears in these illustrations, but usually two men go out to fish, one sitting in the stern of the canoe and paddling, the other in the prow and manipulating the net. While the net is being dipped, the fisherman in the stern paddles quite rapidly along and makes a great noise, swishing the water back and forth in order to scare the fish near the stern toward the prow. He also has a couple of short sticks with which, just before the net is to be raised, he drums upon the sides of the canoe in order to frighten as many as possible of the fish toward the prow. The fisherman in the prow finally raises the poles and brings up the net, placing the angle at which the poles meet under the prow of the boat, which, as has been stated, has a long, flat, upward slope. The cross-bar of the net poles is slipped over the top of the prow so as to prevent the points of the poles from falling back into the water. In this manner the points of the poles project from the prow like two great horns. Their M K 226

fish basket, and one or two others. Twining is the only technique used, all coiled baskets coming from this region being extraneous to the true native culture. The majority of the conical burden baskets made of willow or hazel which are in use among the Klamath are made by themselves, though they do purchase from the Shasta to the southwest a burden basket which is more nicely finished than their own. M K 285 [139]

Together with this very specialized tule culture, resulting from the life of the people upon the immediate lake shore, go water foods, particularly wokas and fish, and the special implements devoted to the gathering of the wokas and to the capture of various animals, birds, and fish. Such for instance are the peculiar duck arrow, the large dip-net, the net used at night in connection with a light in the canoe for catching ducks and other water birds, the many-pointed fish spear, the two forms of bone hooks, the dug-out canoe, and the forked pole for propelling it in shallow water. The peculiar stone implements, such as the two-horned muller, L-shaped and discoidal pipes, and triangular net-sinker, are also noteworthy. M K 105 22 415 [133] [184] [501] [276]

The specialization of culture in this region is very striking indeed when it is compared with the culture of surrounding peoples, as for instance, the Paiute to the east, where coiled basketry predominates and tule work is almost unknown, and with that of the Indians of the Upper Columbia river region to the north, whose culture was very largely influenced by the buffalo or plains Indian culture. A comparison with the Oregon Indians is difficult not only because the Oregon cultures are comparatively little known, but because the majority of Oregon Indians, owing to their habitat, showed either a coast or a desert culture, which is not readily comparable with the inland lake environment and culture of the Klamath and Modoc. The Indians in certain respects most similar to the Lutuami in culture lived down the Klamath river in the northwestern part of California. Here are found such things as the stone maul and the large triangular fish net. Here also the basketry is entirely twined and in a large measure of comparatively soft materials; and the willow or hazel burden baskets are very similar in their general appearance, form, and particularly in the border finish. THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

By Albert S. Gatschet.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
121 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

128 The topography of these highlands, which contain the headwaters of the
Klamath River of California, will be discussed at length after a mention of
the scanty literature existing upon this comparatively little explored tract of
land.

THE HOME OF THE PEOPLE.

131 657 648 The home of the Klamath tribe of southwestern Oregon lies upon the eastern slope of the southern extremity of the Cascade Range, and very nearly coincides with what we may call the headwaters of the Klamath River, the main course of which lies in Northern California. Its limits are outlined in a general manner in the first paragraph of the treaty concluded between the Federal Government and the Indians, dated October 14, 1864, which runs as follows: "The Indians cede all the country included between the water-shed of the Cascade Mountains to the mountains dividing Pit and McCloud Rivers from the waters on the north; thence along this water-shed eastwards to the southern end of Goose Lake; thence northeast to the southern end of Harney Lake;* thence due north to the forty-fourth degree of latitude; thence west along this same degree to Cascade Range." It must be remarked that the homes and hunting-grounds of two "bands" of the Snake Indians were included within these limits, for these people were also made participants to the treaty.

Here, as with all other Indian tribes, the territory claimed must be divided into two parts, the districts inclosing their habitual dwelling-places and those embodying their hunting and fishing grounds, the latter being of course much larger than the former and inclosing them. The habitual haunts and dwelling-places of the tribes were on the two Klamath Lakes, on Klamath Marsh, on Tule Lake, and on Lost River. Some of these localities are inclosed within the Klamath Reservation, of which we will speak below.

133 The Cascade Range is a high mountain ridge following a general direction from north to south, with some deflections of its main axis. The line of perpetual snow is at least 10,000 feet above the sea-level, and the altitude of the highest peaks about 12,000 to 14,000 feet. On the west side the sloping is more gradual than on the east side, where abrupt precipices and steep slopes border the Klamath highlands and the valley of Des Chutes River. The range is the result of upheaval and enormous volcanic

---

* Harney Lake is the western portion of Malheur Lake, and now united with it into a single sheet of water.

133 eruption, the series of the principal peaks, as the Three Sisters, Mount Jefferson, and Mount Hood, marking the general direction of the ridge.

The formation consists of a dark and hard basaltic and andesitic lava, which also forms numerous extinct volcanic cones and basins lying on the east side of the range (Mount Scott, Crater Lake, craters in Sprague River valley, etc.). This formation underlies the whole of the Klamath River headwaters, but stratified deposits cover it at many places, consisting of sandstone, infusorial marls, volcanic ashes, pumice-stone, etc. Prof. J. S. Newberry* describes this volcanic rock as "a dark vesicular trap".

East of the basin of the Klamath Lakes and south of the Columbia River water-shed lies an extensive territory extending to the east towards Owyhee River, and having its largest area in Nevada and Utah. It has been called the Great Basin of the Interior, and has an average altitude of 5,000 feet. The numerous fault-fissures intersecting it from north to south form its principal geologic feature. In the Quaternary period long and narrow lakes marked those faults on the obverse side of their dip; and even now, when evaporation has left these depressions almost dry, small bodies of water mark the site of the fissures even where erosion has obliterated most traces of a fracture of the earth's crust. The most conspicuous of these fissures in the basaltic formations are in Oregon, northern California and Nevada: the valley of Quinn River, Alvord Valley with Pueblo Valley, Guano Valley, Warner Lake with Long and Surprise Valley, Abert, Summer, and Silver Lake Valley. A geologic reconnaissance of the country west of this northwestern portion of the Great Basin, the central parts of which were once filled by the Quaternary Lake Lahontan, with its enormous drainage basin, would probably prove a similar origin for the two Klamath Lakes with Klamath Marsh, and for Goose Lake Valley.

These two secondary basins lie nearest the base of the great mountain wall of the Cascade Range, and therefore receive a larger share of the rain precipitated upon it than the more distant ones. The supply of water received during the year being thus larger than the annual evaporation, the excess flows off in the streams which drain the basin. There is much analogy between the basin of the Klamath Lakes and that of Pit River;

---

[113]

* Pacific Railroad Reports, 1854–'55, vol. 6, part 2, pp. 34–39.

133 both form elongated troughs, and the waters escaping from them reach the lowlands through deep cuts in the resistant material. The difference lies only in this, that the drainage of the Klamath headwater basin has been less complete than that of the Sacramento and upper Pit River; and large portions of its surface are still occupied by bodies of water.

The lakes which show the location of longitudinal faults are the more shallow the more distant they are from the Cascade Range, and those which possess no visible outlet necessarily contain brackish water, as the alkaline materials in them are not removed by evaporation. It is a noticeable fact that those lakes which were nearest the seats and haunts of the Klamath Indians are all disposed in one large circle: Klamath Marsh, Upper and Lower Klamath Lakes, Rhett or Tule Lake, Clear or Wright Lake, Goose Lake, Abert Lake, Summer Lake, Silver Lake with Pauline Marsh. Besides this several other depressions now filled with marshes and alkali flats show the existence of former water-basins.

TOPOGRAPHIC NOTES.

The most prominent object of nature visible from the level parts of the Klamath Reservation is the Cascade Range with its lofty peaks. Seen from the east shore of Upper Klamath Lake, it occupies nearly one hundred and fifty degrees of the horizon. Though Shasta Butte, visible on the far south, does not properly belong to it, the ridge rises to high altitudes not very far from there, reaching its maximum height in the regular pyramid forming
[37] Mount Pitt. This pyramid is wooded on its slopes, and hides several mountain lakes—Lake of the Woods, Buck Lake, and Aspen Lake—on its southeastern base. Following in a northern direction are Union Peak, Mount Scott, and Mount Thielsen, with many elevations of minor size. At the southwestern foot of Mount Scott lies a considerable lake basin about twenty miles in circumference, and at some places two thousand feet below its rim. The water being of the same depth, this "Crater Lake" has been pointed out as probably the deepest lake basin in the world (1,996 feet by one sounding), and it also fills the largest volcanic crater known. At its southwestern end a conical island emerges from its brackish waters, which is formed of scoriæ—proof that it was once an eruption crater. The altitude of the

133 water's surface was found to be 6,300 feet; and this remarkable lake is but a short distance south of the forty-third degree of latitude. Capt. C. E. Dutton, of the U. S. Geological Survey, has made an examination of the lake and its surroundings, and gave a short sketch of it in the weekly "Science" of New York, February 26, 1886, from which an extract was published in the "Ausland" of Stuttgart, 1887, pp. 174, 175.

On the west side of Mount Scott and Crater Lake rise the headwaters of the North Fork of Rogue River, which run down the western slope, and a narrow trail crosses the ridge south of the elevation. Northeast of it and west of Walker's Range lies a vast level plain strewed with pulverized pumice-stone, and forming the water-shed between the affluents of the Klamath and those of Des Chutes River, a large tributary of the Columbia.

Upper Klamath Lake, with its beautiful and varied Alpine scenery, verdant slopes, blue waters, and winding shores, is one of the most attractive sights upon the reservation. Its principal feeder is Williamson River, a water-course rising about thirty miles northeast of its mouth. After passing through Klamath Marsh it pursues its winding course south through a cañon of precipitous hills, six miles in length; then reaches a wide, fertile valley, joins Sprague River coming from Yáneks and the east, and after a course of about sixty miles empties its volume of water into Upper Klamath Lake near its northern end. The elevation of this lake was found to be about eighty feet higher than that of Little Klamath Lake, which is 4,175 feet. Wood River, with its affluent, Crooked River, is another noteworthy feeder of the lake, whose shores are partly marshy, partly bordered by prairies and mountains. The lake is embellished by a number of pretty little islands, is twenty-five miles long in an air-line, and varies between three and seven miles in width. On the eastern shores the waters are more shallow than on the western.

[103] The waters of the lake first empty themselves through Link River (I-ulalóna), and after a mile's course fall over a rocky ledge at the town of Linkville. From there onward the stream takes the name of Klamath River. Passing through a marsh, it receives the waters of Little Klamath Lake, then winds its circuitous way towards the Pacific Ocean through a hilly and wooded country, cañons, and rapids, innavigable for craft of any

133 considerable size.* Hot springs of sulphuric taste flow westward east of Linkville, one of them showing a temperature of 190° Fahr.

The Klamath Reservation is studded with a large number of isolated and short volcanic hill ridges, with a general direction from northwest to southeast. South of Klamath Marsh there are elevations culminating at 5,650 and 6,000 feet, and in Fuego Mountain 7,020 feet are attained. Yámsi Peak, between Klamath Marsh and Sykan Marsh (5,170 feet) reaches an altitude of not less than 8,242 feet, thus rivaling many peaks of the
[657] Cascade Range. The Black Hills, south of Sykan (Saikéni) Marsh, rise to
133 6,410 feet, but are surpassed by several elevations south of Sprague River,
103 near the middle course of which the Yánéks Agency (4,450 feet) is situated. Sprague River (P'laíkni k̲ók̲e), the most considerable tributary of Williamson River, drains a valley rich in productive bottoms and in timber.

The basaltic ridge, which forms a spur of the Cascade Range and passes east of Fort Klamath (I-ukák), slopes down very abruptly toward the Quaternary lake basin, now forming a low marshy prairie and watered by Wood River (E-uk̲alkshíni k̲ók̲e), which enters upper Klamath Lake near Kohásbti and by Seven Mile Creek, nearer the Cascade Range. This basaltic spur, called Yánalti by the Indians, represents the eastern side of a huge fault-fissure. Its altitude constantly decreases until it is crossed by a rivulet one-eighth of a mile long, called Beetle's Rest (Tgúlutcham Kshutĕ'lsh), which issues from a pond, drives a mill, and then joins Crooked River (Yánalti k̲ók̲e, or Tutashtalíksini k̲ók̲e). This beautiful spring and stream were selected by the Government as the site for the Klamath Agency buildings. The old agency at Kohásbti (Guhuáshkshi or "Starting-place") on the lake, three miles south, was abandoned, and a subagency established at Yáneks. The agency buildings are hidden in a grove of lofty pine trees. South of these the ridge rises again and culminates in an elevation, called Pítsua (4,680 feet). The junction of Sprague and Williamson Rivers is marked by a rock called Ktái-Tupákshi, and described in Dictionary, page 149, as of mythic fame. South of Sprague River the ledge rises again, and, approaching close to the lake shore, forms Modoc Point, a bold head-

---

[114] * I have not been able to visit *personally* other parts of the Klamath highlands than the eastern shore of Upper Klamath Lake, from Fort Klamath to Linkville.

103 land, which culminates in an elevation east of it, measuring 6,650 feet, in
133 Nflaks Mountain (Nflakshi, "Daybreak"), on the lake shore, and in Swan Lake Point (7,200 feet), about eight miles from Klamath Lake. A deep depression south of this height is Swan Lake Valley (4,270 feet), and a high hill north of the two, near Sprague River, is called Saddle Mountain (6,976 feet). Yáneks Butte, with a summit of 7,277 feet, lies midway between the headwaters of Sprague River and the Lost River Valley. A long and steep ridge, called the Plum Hills, rises between Nflaks and the town of Linkville.

We now arrive at what is called the "Old Modoc Country." The main seat of the Modoc people was the valley of Lost River, the shores of Tule and of Little Klamath Lake. Lost River follows a winding course about as long as that of Williamson River, but lies in a more genial climate. The soil is formed of sandstone interstratified with infusorial marls. Nushaltkága is one of its northern side valleys. At the Natural Bridge (Tilhuántko) these strata have been upheaved by a fault, so that Lost River passes underneath. The sandstone is of volcanic origin, and contains pumice and black scoria in rounded masses, often of the size of an egg. The largest part of Tule Lake, also called Rhett Lake and Modoc Lake (Móatak, Móatokni é-ush), lies within the boundaries of California. It is drained by evaporation only, has extinct craters on its shores, and the celebrated Lava Beds, long inhabited by the Kómbatwash Indians, lie on its southern end.

Clear Lake, also called Wright Lake (by the Modocs, Tchápsχo), is a crater basin, with the water surface lying considerably below the surrounding country. Its outlet is a tributary of Lost River, but is filled with water in the cooler season only. Little or Lower Klamath Lake (Aká-ushkni é-ush) is fed by Cottonwood Creek, and on its southern side had several Indian settlements, like Agáwesh. It has an altitude of 4,175 feet, and belongs to the drainage basin of Klamath River. South of these lakes there are considerable volcanic formations, which, however, lie beyond the pale of our descriptive sketch.

133 Peculiar to this volcanic tract is the frequent phenomenon of the pond sources (wélwash, nushaltkága). These sources are voluminous springs of limpid water, which issue from the ground at the border of the ponds with

133 a strong bubbling motion, without any indication of other springs in the vicinity. They are met with in soil formed of volcanic sands and detritus, have a rounded shape with steep borders, and form the principal feeders of the streams into which they empty. Ponds like these mainly occur in wooded spots. Some of them have a diameter of one hundred feet and more, and are populated by fish and amphibians of all kinds.

The lake region east of the Reservation was often visited in the hunting and fishing season by the Klamath Lake, Modoc, and especially by the Snake Indians Goose Lake was one of the principal resorts of the Snake and the Pit River Indians; and even now the numerous rivulets flowing into it make its shores desirable to American stockmen and settlers. Warner [103] (or Christmas) Lake, fully thirty-five miles in length, was once enlivened by the troops camping at Fort Warner, on its eastern side.* Chewaukan Marsh (Tchuaχē'ni) has its name from the tchuá or "water potato", the fruit of *Sagittaria*, and is by its outlet connected with Abert Lake.

The Indians of the Reservation annually repair about the month of June to Klamath Marsh (É-ukshi) to fish, hunt, and gather berries and wókash or pond-lily seed, which is one of their staple foods. Its surface is somewhat less than that of Upper Klamath Lake. Its shores are high on the southeastern, low and marshy on the northwestern side. Water appears at single places only, insufficient to warrant the marsh being called, as it often is, a lake.

137 The Oregonian portions of the country described belong politically to Klamath and to Lake Counties, the county seats of which are Linkville and Lakeview, on the northern end of Goose Lake. The latter place also contains a United States land office.

FLORA AND FAUNA.

Vegetation usually gives a characteristic stamp to a country, but in arid districts, as those of the Klamath highlands, it is rather the geological features which leave an impress on our minds The further we recede from

---

[113] * Goose and Warner Lakes are described in Lieutenant Wheeler's Report, Annual Report of Chief of Engineers, 1878 8°. Appendix N N, pp. 113–120. Goose Lake, by Stephen Powers, in "A Pony Ride on Pit River," Overland Monthly of San Francisco, October, 1874, pp. 342–351.

136 for small game, as field-mice, or for sedge-hens and smaller birds. The 192 largest bird of the country, the golden eagle, or Californian condor (p'laíwash), has become scarce. Blackbirds exist in large numbers, and are very destructive to the crops throughout Oregon. Other birds existing in several species are the owl, lark, woodpecker, and the pigeon. Migratory birds, as the humming-birds and mocking-birds, visit the Klamath uplands, especially the Lost River Valley, and stop there till winter.

The species of fish found in the country are the mountain trout, the salmon, and several species of suckers. Of the snake family the more frequent species are the garter-snake (wíshink), the black-snake (wámĕnigsh), and the rattlesnake (k̲é-ish, k̲ī'sh). Crickets and grasshoppers are roasted and eaten by the Indians, also the chrysalis of a moth (púlχuantch).

THE ASPECTS OF THE COUNTRY.

> Elle est riante ainsi que l'Italie,
> Terrible ainsi que les rives du Nord.

133 The Klamath plateau presents very different aspects and produces very different impressions, according to the observer's condition and the character of the localities he enters or beholds. Travelers coming over the monotonous rocky or alkaline plains extending between Malheur Lake and the Reservation are gladdened at the sight of rivulets and springs, imparting a fresher verdure to the unproductive soil, and greet with welcome the pineries which they behold at a distance. Feelings of the same kind penetrate the hearts of those who enter the highlands from the Pit River country of California when they come to the well-watered plains of Lost River after crossing the desolate lava formations lying between. The scenery can be called *grand* only there, where the towering ridge of the Cascade Mountains and the shining mirrors of the lakes at their feet confront the visitor, surprised to see in both a reproduction of Alpine landscapes in the extreme West of America.* The alternation of jagged and angular outlines with long level ridges on the horizon suggests, and the peculiar lava color retained by

---

* The large pyramidal cone of Mount Pitt is a rather accurate duplicate of the celebrated Niesen Peak in the Bernese Oberland, Switzerland, as seen from its northern and eastern side.

133 the highest peaks confirm the eruptive origin of these mountains. The pure azure sky and the perpetual silence of nature reigning in these uplands add impressions of grandeur which it is impossible to describe. The sense of the beautiful has no gratification in the austere forms of these mountains, but the blue and limpid waters of the lakes, their numerous islands, and the lovely green of the shores, delight it in the highest degree.

133 The other eminences perceptible on the horizon lack the boldness of
137 outline seen upon the main ridge, and with their dusky timbers deeply contrast with it. They seem monotonous and commonplace, and people easily impressed by colors will call them somber. The open country, whether marshes, plains, clearings, meadows, or bare hills, presents an extremely bleak aspect, especially when under the influence of a hot summer sun. Its unvarying yellowish hue, produced by the faded condition of the coarse grasses, renders it monotonous.

133 The solitude and serenity of these places exercise a quieting influence upon the visitor accustomed to the noisy scenes of our towns and cities. Noiselessly the brooks and streams pursue their way through the purifying volcanic sands; the murmur of the waves and the play of the water-birds, interrupted at times by the cry of a solitary bird, are the only noises to break the silence. Beyond the few settlements of the Indian and away from the post-road, scarcely any trace of the hand of man reminds us of the existence of human beings. There Nature alone speaks to us, and those who are able to read history in the formations disclosed before him in the steeper ledges of this solitary corner of the globe will find ample satisfaction in their study.

132 The Klamath plateau, though productive in game, fish, and sundry kinds of vegetable food, could never become such a great central resort of Indian populations as the banks of Columbia River. The causes for this lie in its secluded position and chiefly in its climate, which is one of abrupt changes. The dryness of the atmosphere maintains a clear sky, which renders the summer days intensely hot; the sun's rays become intolerable in the middle of the day at places where they are reflected by a sandy, alkaline, or rocky soil and not moderated by passing breezes. Rains and hailstorms are of rare occurrence, and gathering thunder clouds often dissolve or "blow

361 [342] transitory camps are marked by frail willow lodges (látchash, stinā'sh) or other light structures. Indian camps are as a rule located near rivers, brooks, marshes, springs, or lakes. Hunters generally erect their lodges in convenient places to overlook a considerable extent of territory.

In the lists below the order in which the localities are mentioned indicates the direction in which they follow each other. I obtained them from the two interpreters of the reservation, Dave Hill and Charles Preston; and as regards the old Modoc country, from Jennie Lovwer, a Modoc girl living in the Indian Territory, who remembered these places from her youth. The grammatic analysis of the local names will in many instances be found in the Dictionary.

CAMPING PLACES ON KLAMATH MARSH.

103 361 The permanent dwellings upon this marsh have all been abandoned; but the Modocs and Klamath Lakes, together with some Snake Indians from Sprague River, resort there annually, when the pond-lily seed and the berries ripen, for a period of about six weeks. Its shores were permanently inhabited in 1853, when visited by the United States exploration party under [133] Lieutenants Williamson and Abbott, and even later. Dave Hill's list below follows the localities in their topographic order from northeast to southwest and along the southeastern elevated shore of the marsh, which at some places can be crossed on foot. A few rocky elevations exist also on the northeast end of the marsh.

Katā'gai "stumpy bushes."
Táktaklishkshi "reddish spot."
Yaúkĕlam Láshi "eagle wing."
Yásh-Lamā'dshi "projecting willow."
Spúklish Láwish "sweat lodge on promontory."
Mbáknalsi "at the withered tree."
Kmutchuyákshi "at the old man's rock;" a man-shaped rock formation near the open waters of the marsh and visible at some distance.
Lalawasχē'ni "slaty rock."
Taktχísh "cricket noise."
Tsásam Péwas "skunk's dive."
Ktai-Wasi "rocky hollow."
Snálaχēni "at the rock-pile."
Lúlpaḵat "chalk quarry."
Kapgā'kshi "dwarf-pine thicket."
Wáptasχāni "water moving through ponds perceptibly."
Tchókeam Paísh "pumice-stone nose."
Ḵáḵsi "raven's nest."
Íwal "land's end."
Luyánsti "within the circle."
Yaúkĕlam Snólash "eagle nest."
Tchíkas-Walákish "bird-watch;" secreted spot where hunters watch their feathered game.
Tuílkat "at the small rail pyramid."
Awaluashχē'ni "at the island."

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

103 361 Tχalamgíplis "back away from the west;" probably referring to a turn of the shoreline.

Wák-Talíksi "white pine on water-line."

Wíshiukam Tinuash "drowned snake;" place where a garter snake was found drowned in the open waters of the marsh.

Lgû'm-Á-ushi "coal lake," with waters looking as black as coal.

Súmde "at the mouth or outlet."

Núskai "skull-place;" a human skull was once found there. This is one of the spots where the natives submerge their dug-out canoes in the mud or sand at the bottom of the lake for the wintry season.

Some of the above places near the outlet are also mentioned in Pete's Text on the "Seasons of the Year," and the following additional may be inserted here from it (74, 15–17):

Lĕmé-isham Nutē'ks "impression of thunderbolt."

Lál'lăks "steep little eminence."

Stópalsh-tamā'dsh "peeled pine standing alone."

K̲ák̲-Kshéwalliksh "raven on the pole."

CAMPS ALONG WILLIAMSON RIVER.

[133] In this list Dave Hill enumerated old camps and present locations of lodges (1877) on both sides of Williamson River, from the lower end of Klamath Marsh (4,547 feet) to Upper Klamath Lake. The river runs for six miles or more through a ravine about two hundred feet deep, and the road follows it on the east side, leading over the hills. The wigwams are built in proximity to the river course. At its outlet Williamson River forms a delta, projecting far out into the lake, and filled with bulrushes.*

Kakagō'si "at the ford."

Samka-ushχā'ni "cliffs in the river;" a fishing place.

Yále-alant "clear waters."

Tánua-Lutlish "flat rocks under the water."

K̲ā'k̲-Talíksh, or K̲ā'k̲-Talish "twin rocky pillars."

Awalokákaskai "at the little island."

Mbúshaksham Wā'sh "where obsidian is found."

Tχálmakstant (supply: Ktái-Tupákshi) "on the west side of (Standing Rock)."

Tchpinókaskai "at the graveyard;" cemetery and ancient cremation ground of the É-ukshikni.

Ktá-iti "place of rocks."

Tchikāsi "at the submerged spot."

Kúltam Wā'sh "otter's home."

Stílakgish "place to watch fish."

Yá aga "little willows." Here the road from Linkville to Fort Klamath crosses Williamson River on a wooden bridge built by the United States Government; here is also the center of the Indian settlements on Williamson River.

Kúls-Tgé-ush, or Kúlsam-Tgé-us "badger standing in the water."

Witā'mamtsi "where the black bear was."

Kuyám-Skā-ika "crawfish trail."

Slánkoshkaōkai, or Shlankoshkshû'kshi "where the bridge was."

Kok̲ákai "at the brooklet."

Kuyága, a former cremation place in the vicinity of Yá aga.

NOTES.

This is one of the most popular myths current among the É-ukishikni, and we shall find it partially repeated in another myth, recounted by Dave Hill. Aíshish and his father K'mukámtchiksh represent powers of nature engaged in everlasting strife for mutual extermination. In this myth K'múkamtch resorts to the following trick to destroy his offspring. Seeing young larks in a nest on the top of a sorrel-stalk, he informs him, that if he climbs up there, he can obtain a nest of eagles with all its inmates. Gladdened with the prospect of this capture, Aíshish climbs up, but the insidious father causes the plant to grow miraculously fast under him, so that descent becomes impossible, and Aíshish comes near perishing by hunger and exposure.

In the recollection and wording of some portions of the myth my informant was assisted by "Captain Jim."

94, 1–7. The short fragment of a creation myth preceding the Aíshish tale stands in no causal connection with it, and could as well be inserted elsewhere. Myths entering upon the *details* of the creation of the world by K'mukámtchiksh do not, as far as ascertained, exist among this people, but in their stead we have many myths for special creations (of man, animals, islands, mountains etc.). A grammatic analysis of the terms occurring in this fragment (from Lûpí nā'lsh to pátki gi) was inserted by me in the *American Antiquarian*, Vol. I, No. 3, pages 161–166, under the heading: "Mythologic Text in the Klamath Language of Southern Oregon."

192 94, 1. Lûpí shutä́yéga is not to be considered as a repetition, for it means: when
193 K'múkamtch began to create the world he made *us* before he made the fish, other animals, and the dam at Linkville. This is, of course, only a small fragment of all the creation myths of this people.

94, 2. shashapkēlía: to tell or count stories, myths or fables in the interest or for the pleasure of somebody; the i is here doubled to obtain a rhetorical effect.

94, 3. K'mú'kamtchish is a contraction of K'mû'kamtch tchish; Aíshish, K'múkamtch also. The longer form of the name of the deity occurs 95, 20.

94, 3. ká-akt, metathetically for kákat; kát is pron. relat. which, what, the thing which. nánuktua ká-akt gü̈g comprehends all animate and inanimate creation.

94, 4. wá, uá, to stay, exist, live in; is always connected with an indirect object indicating the place, spot, locality or medium where the subject lives or exists.

94, 4–6. The construction of the sentence runs as follows: Tchúyunk (K'mukámtch) né-ulχa gi'tki gíug páplishash I-ulalónan, páltki ti'wish gint udûlshámpkash mû' nkillipkash, mû'ash shlé-uyuk; "when a south wind blows, it will stop the waters from
133 rushing down rapidly over the cataract." The outlet of Upper Klamath Lake, called
132 Link River, runs from north to south, over the falls at Linkville; hence a powerful
226 south wind will stem the current of Link River above the falls, leave its bottom dry or almost dry, and enable the Indians to catch the fish swimming in the shallow water or wriggling in the mud. The rocky ledge under the cataract is supposed to be the gift of K'múkamtch.

PART TWO: ETHNOGRAPHIC TEXTS

Introductory Note to Text 22

"Wokas" is the generic term for the seed of the common pond lily (*Nymphaea polysepala*). In the old days much of the Klamath Marsh (estimated by some early writers at about 10,000 acres) was covered with these plants, and there were long, shallow bays filled with them on both sides of Klamath Lake. Much of Klamath economic life was concerned with the gathering, preparation, and cooking of this plant. 824 [133] [433]

It is not proposed here to give a complete description of the various processes involved in "wokas"-manufacture. Good explanations of this economic complex will be found in Coville,[69] Gatschet,[70] and Spier.[71] The following text (and the two shorter ones by Mrs. Pompey which come after it) are intended only to illustrate Klamath narrative style and to indicate those features of "wokas"-making which were salient in the view of the informants. 252 [114] [128]

22. Wokas Preparation

(Mrs. Aggie Butler)

539* 222 501

(1) Long ago the Indians used to gather wokas, with a canoe. (2) And standing up on it they gathered wokas. (3) They bent down to pull them off, that wokas. (4) And they pulled off only the good ones, and some were unripe. (5) And having punctured it [with a fingernail] they saw [whether it was ripe or not]. (6) And they picked the yellow ones. (7) On becoming ripe it looks good, big. (8) And having picked those only, they threw them on the canoe and went. (9) And some were termed "snoníapíaqs." (10) And one was called "sbokẃas." (11) It was ripe. (12) And they put them down [in the canoe] apart.

KEY TO THE MAP OF PLACE NAMES

1. /moc̓o·ǰa·ks/. Spier 1.
2. /qdaywa·s/ "Rock-Nest." Spier 2.
3. /gapgaʔa·kksi/ "Little-Pine-Place." Spier 3.
4. /ʔiWʔa·l̓a/ "On-the-End." Spier 4.
5. /q̓la·ǰaksi/ "Blueberry-Place." Spier 5.
6. /doylḱst/. Spier 6.
7. /ʔawalwasge·ni/ "Island-Place." Spier 7.
8. /ga·qs ksawalye·ks/ "Carry-Crow-up-the-Hillside."
9. /c̓ik̓as waLaqk̓is/ "Bird-Lookout." A hill across from /ʔawalwasge·ni/.
10. /waktali·s/ "Lodgepole-Pine-Place" (?). Spier 8.
11. /lalʔa·ks/ "Little-Hill-Place." Spier 9.
12. /wisingam dinwas/ "Snake's-Lying-in-Water." A campsite for wokas-pickers.
13. /čaba·ni/ "Herd-Going-to-the-End." A dwelling.
14. /lḱom ʔews/ "Charcoal-Lake." The name of the small marsh shown on the map.
15. /somdi/ "Mouth-Place." A campsite where the river enters the forest.
16. /c̓omsʔam gotq̓aks/ "Sucker's-Going-up-out." A campsite near /somdi/.
17. /n̓osksi/ "Head-Place." Small village site near Kirk.
18. /sniWa·tgalsi/ "Eat-First-Place." A campsite.
19. /ʔeqčsalḱis/ "Sharpening-Instrument." A traveller's campsite.
20. /sqamdiwa·s/ "Sqamdi's-Den." The home of a dangerous mythological being. See Text 19.
21. /gosʔam gotq̓aks/ "Swan's-Going-up-out."
22. /yalyalʔant/ "Where-It-Is-Clear." Spring Creek.
23. /weq sqatq̓aks/ "Limbs-Stick-out-of-Water." A large spring.
24. /qbolWiʔamge·ni/ "Plant (sp.)-Place." A large village on both sides of the river.
25. /dali·ks/ "Standing-on-the-Bank." A village site.
26. /lobaqsksaksi/ "Chalk-Place." Spier 10.
27. /q̓ac̓w̓e·č/. Spier 12.

28. /ʔoqsoeʔam sloqtis/ "Cough's-Spitting-on." Also called /yawqsalks/ 103
"Medicine-Getting-Place." A rock on which consumptives spat 127
to gain a cure.
29. /g̣ome·ksi/ "Cave-Place." Spier 13. 102
30. /g̣oqṁa·kksi/ "Little-Caves-Place." 133
31. /hehǰi·ʔasamksi/ "Hehǰi·ʔas'-Place." The home of a mythological being. See Text 8.
32. /g̣oqq̇a·kksi/ "Little-Rivers-Place." A spring.
33. /kiwi·ki·na/ "Taking-out-of-Water-with-a-Pointed-Instrument." A spring.
34. /wačksi/ "Horse-Place."
35. /ṅa·ćaksi/ "Snipe-Place." A spring.
36. /kolsʔamksi/ "Badger's-Place."
37. /g̣awamg̣e·ni/ "Spring-Place." Spier 14.
38. /g̣oksi/ "Swan-Place." P.O. gave /ngoksi/.
39. /daqṅi/ "Sharp-One."
40. /mbosaksawa·s/ "Flint-Place." Spier 17.
41. /tg̣almaksća/ "West-Side." Spier 18.
42. /qdaydi/ "Rock-Place." Spier 19.
43. /g̣le·čṗaḱi·s/ "Clam-Eating." Small settlement.
44. /ǰigyes/. Spier 20.
45. /q̇oLtʔam wa·s/ "Otter's-Den." Spier 21.
46. /ʔaća·wiks/ "Long-Object-in-the-Sun-Place." Spier 22
47. /yaʔa·k/. Spier 23.
48. /ćaq̇wi/. Spier 24.
49. /kols tgews/ "Badger-Standing-in-Water."
50. /wiće·mʔamksi/ "Bear's-Place." Spier 25.
51. /g̣oẏalam ag̣eyqs/ "Crawfish-Crawling-up." Spier 26.
52. /sa·yḱaʔa·k neq̇i·s/ "Little-Plain-Lying-in-the-Way."
53. /qi·ʔa g̣itLas/ "Lizards-Poured-out-on." Williamson River Church.
54. /slanḱoksi/ "Bridge-Place." The bridge near Williamson River Church.
55. /ye·s kselwis/ "Willow-Beside-the-Edge."
56. /čoḱalwas/.
57. /wiẇapĺa·ks/ "Little-Alders-Place."
58. /qdawaldi/ "Cut-on-Top-Place." A village site.
59. /ṗnanksi/ "Burying-Place." An ancient burial ground.
60. /woqsdi/ "Cache-Place."
61. /loltṁalʔaqḱa/ "Little-Winter-House." A village on the east side of the river.

103 62. /bečmi/.
127 63. /spino·ksi/ "Grave-Place." A burial ground.
102 64. /mo·waksl̓a/ "On-the-South-Side." Spier 30.
65. /č̓ink̓os/ "Going-Across-with-the-Fin-Showing." Spier 34.
133 66. /sc̓olksi/ "Bubble-up-Place." A spring bubbles up here.
67. /wisgandi/ "Blow-Through-Place." Spier 31.
68. /laẃa·l̓sdat/ "At-Round-Object-on-the-End." Spier 32.
69. /mo· ginkanks/ "Big-Space-Around." Spier 33.
70. /dokwa/. The mouth of Williamson River.
71. /yawq̓lamksi/ "Bald-Eagle's-Place."
72. /č̓iya·l̓sʔamksi/ "Salmon's-Place."
73. /yay̓a·k̓a liwi·ki·na/ "Little-Willows-in-a-Group-along-the-Edge."
74. /ba·go·lsam bani·gis/ "Muledeer's-Wading-out."
75. /hiwwas/ "Spread-out-in-Water." A swampy island just offshore.
76. /toq̓asksi/ "Willow-Place."
77. /ya·s ksaẃa·l̓s/ "Willow-on-the-End."
78. /qdayksi/ "Rock-Place." Spier 45.
79. /sohi·yagye·ks/ "Jumping-Over-for-Fun." Spier 46.
80. /ʔiwli·wa/ "On-the-Very-Edge." Spier 47.
81. /čalčal̓a·ks/. A spring near /diwi·ʔa·ks/.
82. /diwi·ʔa·ks/ "Little-Rapids-Place." Spier 48.
83. /wilwaldi/. A spring north of /gawammat/.
84. /gawammat/ "In-the-Spring." Spier 49.
85. /ditq̓aks/ "Boiling-out." Spier 50.
86. /ni·Laqs/ "Sunrise." A place near Barclay Springs.
87. /ẃawʔa·qk̓alamksi/ "Little-Ears-Place." A cove that has the shape of an ear.
88. /kalẃa·l̓/ "Sharp-on-the-End." Spier 51.
89. /wq̓ol̓was/ "Knotted-in-Water." Buck Island; Spier 52.
90. /lam̓a·č/ "Round-Object-on-the-End." Spier 53.
91. /watanks/. A hill east of /lam̓a·č/.
92. /ʔiWLi/ "Is-Inside." A cove north of /ksonksi/.
93. /ksonksi/ "Grass-Place." Spier 54.
94. /wl̓i·č/. A hill north-east of Klamath Falls.
95. /mp̓aq̓wals/ "Dry-on-Top." A hill northeast of Klamath Falls.
96. /diwi·ʔa·ks/ "Little-Rapids-Place."
97. /ʔiWawn̓a/ "Propped-up-against." Spier 55.
98. /gitba·tanks/ "Poured-up-on-Shore." A narrow channel where the wind was reputed to blow the water back upstream.
99. /qday ginqis/ "Hole-Through-Rocks." A camping ground and a village site.

100. /ʔiWLaLLo·nʔa/ "All-along-the-Top." Klamath Falls; Spier 56. 103
101. /lalawq̓at/. 127
102. /č́ews hollamnas/ "Yellowhammer-Flying-along-the-Side." 102
103. /weqwe·Las/ "Falling-Downhill." Spier 57. 133
104. /lewsi/ "Round-Object-in-Water-Place." A small hill.
105. /tan̓aq̓aksi/. Spier 58.
106. /ʔiWba·tanʔa/ "Right-up-against." Spier 59.
107. /woksalks/ "Wokas-Getting-Place." Spier 60.
108. /dekčanks/ "Netting-Place." Skillethandle Point; Spier 61.
109. /heele·ks/ "Apparition-Place." A place where spirit-otters appear and swim around one's canoe.
110. /č́ayankadi/ "Berry (sp.)-Place."
111. /nǰaqǰaqk̓is/ "Ringing-Instrument." A large rock with a depression in it. When this depression was pounded with another rock, a wind arose.
112. /seesti tgaw̓a·l̓s/ "Shasta-Standing-on-the-End." Squaw Point; Spier 62.
113. /no·galks/ "Roasting-Place." Roots were roasted in pits here.
114. /č́a·q̓y̓a·k ksalamnas/ "Little-Boy-Lying-on-the-Hillside."
115. /qe·Yqe·Y̓lant/ "Where-It-Is-Rough." A campsite.
116. /ʔawsmi/. Bare Island.
117. /č́eqs dawals/ "Blackbird-Standing-on-Top."
118. /stakm̓a·č/ "Projecting-on-the-End." Eagle Point; Spier 43.
119. /qčo·lʔam n̓iwl̓aqs/ "Star's-Fall." A place on the beach near Eagle Point where a meteor fell. The informants reported that a glow was visible at the spot for some time afterwards.
120. /ge·lalks/ "Land-Place." Spier 42.
121. /čak lali·ks/ "Serviceberry-on-the-Bank." A serviceberry patch.
122. /q̓aǰi/. A small settlement.
123. /waq̓a·qksi/. Spier 41.
124. /wačksi/ "Horse-Place."
125. /č́a·q̓y̓a·k̓lamksi/ "Little-Boy's-Place." The home of /č́a·q̓y̓a·k/, a mythological character.
126. /l̓eql̓eqsdi/ "Twinkle-Place."
127. /qawk̓at/. A good cold spring. Said to be named after a mythological character who lives there.
128. /tlaqs p̓ak̓i·s/ "Mullet-Eating." A small spring where /tlaqs/ fish are caught.
129. /molsi/. Said to mean "Black-Swan-Place," but not certain. A spring.

103 130. /ǥawamksaksi/ "Spring-Place." Rocky Point. An old campground during the wokas-picking season.

127 131. /ʔiWqa·y̓a/ "Among-the-Bushes." Spier 39.

102 132. /dinne·kksi/ "Sunset-Place." Spier 38.

133 133. /sk̓awanks lakč̓wis/ "Wild-Parsnips-among-(Rocks)."

134. /sqoywas/ "Mound-in-Water." A spring back in the forest.

135. /ma·damsksi/. A spring three miles south of Crystal Spring at the head of Crystal Creek.

136. /sle·tsksi/ "Nettle-Cord-Place." Spier 35.

137. /čak lalamnas/ "Serviceberry-on-the-Hillside." Spier 29.

138. /l̓oqo·gat/. Spier 28.

[P.131]

The General Allotment Act

IN THE TREATY OF 1864, THE PROVISIONS FOR ASSIGNING INDIVIDUAL 648*
tracts had anticipated the more elaborate planning that twenty- 657*
three years later resulted in the Dawes—or General Allotment— 423
Act. The principal object of that legislation was to individualize the Indian by assigning him a private tract, to be held in trust by the United States for at least twenty-five years, and by granting him citizenship. In the minds of many, the act was a counterpart to the Homestead Act. Nickerson, arguing against the opening of Yainax as proposed in 1881 by a bill before Congress, had stated of the reservation:

> It is a rocky, volcanic country not one tenth of which would be [134] •
> taken under pre-emption or homestead laws were it thrown open
> for settlement. It is impossible for any person to live and support [137]
> a family on 160 acres of average land. It requires large ranges of this volcanic ashy soil to produce sufficient grass for an ordinary drove of cattle while a strip of low meadow land to produce hay and perhaps some grain is a necessity in successful stock raising in this climate.[1]

From the first, the news of imminent allotment was paired with the realization that left-over reservation lands were to be declared surplus and thrown open to purchase and homesteading by whites. The intelligence reached the Indians even while they were aroused by the barbed-wire encroachments of stockmen on the Upper End (which culminated in the slaying of a former member of the Indian police), coupled with disquieting rumors that the new government survey would exclude much of the valley of the Upper Sprague.[2] Fortunately, not until the following year did Emery receive instructions to evaluate

THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

By Albert S. Gatschet.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

128 The topography of these highlands, which contain the headwaters of the Klamath River of California, will be discussed at length after a mention of the scanty literature existing upon this comparatively little explored tract of land.

124 hold affairs, and terms referring to colors; men more appropriate than women in instructing him about their hunts, fishing, travels, their legal customs, wars and raids, house-building, and similar work. Omit asking them about the deceased, for it makes them angry and sullen. They do not as a rule willfully lead the investigator into error when they see that he is in earnest. Errors often originate in preconceived notions or theories and inappropriate questions of the investigator, sometimes also in the want of abstract terms in the interpreter's language. To insure correctness in an Indian myth, animal story, or any relation whatever, it should first be taken down in Indian, and of this a verbatim translation secured.

114 Ethnographic sketches of both tribes, but chiefly of the Modocs, were published in the newspapers of the Pacific coast at the time of Ben Wright's massacre, but they were not accessible to me; more circumstantial were those written at the time of the Modoc war (1872–'73), and specimens of these may be seen in A. B. Meacham's publications, in the "Overland Monthly" of San Francisco, and in Stephen Powers's "The Modok," in Contributions III, pp. 252–262.

126 Ethnographic objects manufactured by and in actual use among both tribes were purchased at different periods by collectors. The National Museum in Washington owns several of them; but the most complete collection is probably the one made in 1882 by the Swiss naturalist, Alphons Forrer, a native of St. Gall, which was partly sold to the Ethnographic Museum of St. Gall, partly (eighty-five articles) to that of Berne, the capital of Switzerland. Forrer lived several months among the Klamaths, and thus was enabled to secure the best specimens. There are two hänäsish or "magic arrows," an implement which has probably become very scarce now. The majority of these objects are manufactured from wood, fur-
134 skin, and basket material. There is no suitable clay found in the Klamath
323 River Highlands, hence these Indians never made any pottery.

114 The report of Lieutenants Williamson and Abbot contains a large array of astronomic positions and of meteorologic observations made during the expedition, which will prove useful to later observers. The zoölogic, botanic, and geologic reports made by different scientists were considered of high value at the time they were first published. It will be remembered

IV. *Pelican bay group (gu'mbötkni)*.—This includes the Pelican bay district (gu'mböt) on the west side of the lake, the settlements along Four Mile creek, and those on the marsh north of the lake. Runs of fish are plentiful on Wood river in the spring when the snow melts on the mountains. People come up along the river in the summer digging camas. But above Fort Klamath there is too much snow to live during the winter. [222] [132]

35, sle'tsḳsi, a group of two or three earth-lodges on the west side of Seven Mile creek near its mouth. A little spring here keeps the water warm enough for fish even in winter.

36, wudö'kän is a settlement in the marsh a mile from the last, and east of Seven Mile creek.

37, iwünau'ts, two earth-lodges on the western side of a little creek emptying into the lake two miles east of Recreation P. O. Houses are scattered along the marsh shore to the northern side of Pelican bay.

38, dünö'ksi, an open space overlooking the northern end of Pelican bay and containing many earth-lodges. Others are on the lower level, lɛlä'ksti, close to the bay. This is immediately north of the mouth of Four Mile creek. A cremation pile stands a hundred yards north of this town on the slope above the bay, beyond an outcrop of rocks said to be transformed shamans. A big lodge of a shaman on the lower level has a pit twenty-eight feet in diameter; another earth-lodge pit is nearly twenty feet across. [823] [756]

39, e'o'kai, four or five earth-lodges a few hundred yards up Four Mile creek on the left bank.

[756] 40, wa'lö'kdi, four to eight earth-lodges, one a shaman's, somewhat farther up the creek on the opposite side.

41, Waḳ'a'k, a winter settlement south of the high ridge south of Odessa. North of the settlement is a sweat-lodge used by mourners.

42, gai'löks or gaila'lḳs is on the point south of Odessa or more probably between Howard and Shoalwater bays. No winter settlements here but a camping place where du'kwakni and gu'mbötkni roasted camas in the spring.

[136] 43, stö'kmate, Eagle point, is a similar spring camp site. In the hot springs here are harmless black snakes (kamdila'k) which crawl over the swimmers. Curiously, in view of the Klamath tendency to localize their tales, there is no story concerning this locality.

Two other localities may belong to this group: 63, e'o'ḳaḳ, gulch, on Wood river toward the mountains, and 64, e'uḳwa'lksi on the east

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

ONE

The Aboriginal Klamath-Modoc

EASTWARD FROM THE LOFTY CASCADES OF WASHINGTON AND OREGON 133
stretches the elevated and broken country of the central Plateau. Across its face, rivers carry waters from northern watersheds and the slopes of the Rockies and, cleaving the mountain barrier, flow to the sea. Upon the ladder of their waters, the hom- 136 •
ing salmon mount in seasonal surges to spawning grounds far to the interior. It is a province once richly endowed in game, and, early in the peopling of the New World, the Indian found it. In 172
the period toward the end of the Pleistocene period, while the 133
glaciers ebbed upon their centers, some eleven thousand years ago,[2] some of his numbers camped along the Columbia, at the head of an estuary that in those days extended upriver to The Dalles, and left behind antler combs, stone bolas, blades, and the obscure and humble bric-a-brac of the camp. Further upriver, in the open lands of Lind Coulee, others hunted the bison. Below and east of the Plateau, unnamed tribesmen camped along the Pluvial lakes of the Great Basin, whose waters, now gradually drying up, attracted the waterfowl and animals that in turn drew the hunter. In the timeless dessication of its caves, at Fort Rock, Danger, Gypsum, and Lovelock their sandals, basketry, and spear-throwers have been found.

Along the southwestern flanks of the Cascades, a great fault had formed a crescentic trough some one hundred miles in length by twenty-five in breadth. Rivers and creeks fed marsh lands and broad lakes within this great highland and created an earthly paradise for the early hunter-fishermen. Their initial entry has been estimated at about ten thousand years ago, and by the time

Modoc NS17

M clusion of almost everything else. The seeds of this plant,
K gathered and preserved in three different manners, as described
13 in detail by Coville,[4] form the staple article of food and thus
correspond to acorns used over the greater part of California.
About Tule or Rhett lake and the smaller lakes of that vicinity
there are fewer marshes and consequently a smaller supply of
the water-lily. Thus the Modoc were much less abundantly supplied
with this staple than were the Klamath, who are said to
have had on Klamath marsh alone over ten thousand acres of
these plants. The chief vegetable food of the Modoc seems to
have been tubers and bulbs, notably camass and ipos.

M The extensive lakes of this region naturally bring great num-
K bers of water birds of various kinds, including swans, geese,
136 ducks, and wading birds, the majority of which were used by the
Indians as food and in various ways. The skins of swans, geese,
and other birds with especially fine down, were made into
feather blankets, swaddling clothes, etc. Fish were abundant in
the lakes, salmon and salmon trout being especially esteemed by
M the Indians. The presence of this large supply of water birds
K and fish developed certain specialized implements for their cap-
223 ture. For taking birds there were what may be termed a ring-
M pointed arrow, and a special net. There were several methods
K of taking fish, the most important being by the large triangular
226 dip-net used in the dug-out canoe, as shown in pl. 10.
501 The country provided also an abundance of the usual animals,
M such as deer, elk, antelope, and others used for food; and coyotes,
K gray wolves, foxes, badgers, wildcats, rabbits, and various fur-
136 bearing animals furnishing blankets and clothing.
237

BUILDINGS.

M The houses of the Klamath and Modoc were of two kinds. In
K this region where the snow on the higher peaks is always in
342 sight, and where it often reaches a depth of several feet in winter,
[133] a warm and durable house is necessary. This was provided by
[132] the semi-subterranean earth lodge, which was of the usual central
California form, and had a pit from a foot to three or four feet

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State of Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

129 The topography of these highlands, which contain the headwaters of the Klamath River of California, will be discussed at length after a mention of the scanty literature existing upon this comparatively little explored tract of land.

137 278 to produce them. This is true to a certain extent; but as there are so many plants growing there that narcotize the fish, how is it that the country produces no medical plants for the cure of men's diseases? Of the plant shl!ē'dsh, at least, they prepare a drink as a sort of tea.

136 192 The fauna of the Klamath uplands appears to be richer in species than the vegetal growth. What first strikes the traveler's attention on the eastern shore of the Upper Lake is the prodigious number of burrows along the sandy road, especially in the timber, varying in size from a few inches to a foot in diameter. They are made by chipmunks of two species, and others are the dens of badgers, or of the blue and the more common brown squirrel. The coyote or prairie-wolf makes burrows also, but this animal has lately become scarce. No game is so frequent as the deer. This is either the black-tail deer, (shuá-i, *Cervus columbianus*), or the white tail deer (múshmush, *Cariacus virginianus macrurus*), or the mule-deer (pak̲ólesh, *Cervus macrotis*). Less frequent is the antelope (tché-u, *Antilocapra americana*), and most other four-legged game must be sought for now upon distant heights or in the deeper cañons, as the elk (vún), the bear in his three varieties (black, cinnamon, and grizzly; witä'm, náka, lû'k̲), the lynx (shlóa), the gray wolf (kä'-utchish), the silver or red fox (wán), the little gray fox (k̲étchk̲atch), the cougar (táslatch), and the mountain sheep (k̲ó-il). Beavers, otters, minks, and woodchucks are trapped by expert Indians on the rivers, ponds, and brooklets of the interior.

The shores of the water-basins are enlivened by innumerable swarms of water-fowls, (mä'mäkli), as ducks, geese, herons, and cranes. Some can be seen day by day swimming about gracefully or fishing at Modoc Point (Nflakshi) and other promontories, while others venture up the river courses and fly over swampy tracts extending far inland. Among the ducks the more common are the mallard (wē'ks), the long-necked kflidshiks; among the geese, the brant (lálak) and the white goose (waíwash). Other water-birds are the white swan (kúsh), the coot or mudhen (túhush), the loon (táplal), the pelican (yámal or kúmal), and the pinguin (kuítsis). Fish-hawks and bald-headed eagles (yaúχal) are circling about in the air to catch the fish which are approaching the water's surface unaware of danger. Marsh-hawks and other raptores infest the marshes and are lurking there

132 for small game, as field-mice, or for sedge-hens and smaller birds. The
192 largest bird of the country, the golden eagle, or Californian condor (p'laíwash), has become scarce. Blackbirds exist in large numbers, and are very destructive to the crops throughout Oregon. Other birds existing in several species are the owl, lark, woodpecker, and the pigeon. Migratory birds, as the humming-birds and mocking-birds, visit the Klamath uplands, especially the Lost River Valley, and stop there till winter.

The species of fish found in the country are the mountain trout, the salmon, and several species of suckers. Of the snake family the more frequent species are the garter-snake (wíshink), the black-snake (wámĕnigsh), and the rattlesnake (k̲é-ish, k̲í'sh). Crickets and grasshoppers are roasted and eaten by the Indians, also the chrysalis of a moth (púlχuantch).

THE ASPECTS OF THE COUNTRY.

> Elle est riante ainsi que l'Italie,
> Terrible ainsi que les rives du Nord.

133 The Klamath plateau presents very different aspects and produces very different impressions, according to the observer's condition and the character of the localities he enters or beholds. Travelers coming over the monotonous rocky or alkaline plains extending between Malheur Lake and the Reservation are gladdened at the sight of rivulets and springs, imparting a fresher verdure to the unproductive soil, and greet with welcome the pineries which they behold at a distance. Feelings of the same kind penetrate the hearts of those who enter the highlands from the Pit River country of California when they come to the well-watered plains of Lost River after crossing the desolate lava formations lying between. The scenery can be called *grand* only there, where the towering ridge of the Cascade Mountains and the shining mirrors of the lakes at their feet confront the visitor, surprised to see in both a reproduction of Alpine landscapes in the extreme West of America.* The alternation of jagged and angular outlines with long level ridges on the horizon suggests, and the peculiar lava color retained by

---

70. *Song of the little wipēlī'wash forest-bird:*

Wipēli'wash nû shuí'sh gi,
wuiplé'wĕsh nû shuí'sh.

My own song I sing, I the wipēlíwash-bird.
I the wuipléwash am singing about myself.

71. *Song of the witkatkish-hawk:*

Gé-u aí hû tû' sáwals, –́ ⏑ | –́ ⏑ ⏑ | –́ ⏑
witkatkísam gé-u sáwals. –́ ⏑ | –́ ⏑ | –́ ⏑ | –́ ⏑

My head-crest this is, it is that of the witkatkish-hawk.

NOTES.

[825] The incantations obtained from Morgan are mostly of the kind called shuinō'tkish, and a large number of them are attributed to birds. Some of them probably exist in a more explicit form, which was not remembered, and the rhythmic or musical form was obtained of a part of them only. A literal translation of these song-lines is an impossibility in most instances, if their sense has to be rendered in full; I have therefore furnished only paraphrastic interpretations. The list is alphabetic, and was arranged after the names of the animals, or other personified objects, to which the incantations are attributed. Many of these songs are referred to in the "Subject List of Incantations" given by Morgan. *539 533 755 192

164; 1. Ktsálui, to be resplendent with colors, is mainly said of objects showing a blue or purple tinge: pû'ksam shláps ktsáluitko, the camass-plant has a bluish color. This verb is also used when speaking of the rainbow; of the lizard: 165; 14., also of the weasel's fur-skin: 169; 55.

[779] 164; 3. The use of these conjurer's arrows is mentioned 73, 5.

164; 4. Yámsam for Yámasham; cf. *Note* to 111, 4. Of the personified North wind the Indians say "he lives up in the mountains". On the north side the basin of [193] the Williamson River is closed up by high mountains. Gé-ish and génuish, génhuish means the action of going and that of having gone, or the present and the past going; both were translated by "*gait*", "*tread*", a term which does not differ much from the real meaning. Both terms also occur in the songs obtained from "Doctor" John, and are mainly used of quadrupeds, amphibians, and reptiles.

164; 4. kápa probably for gátpa (nû), "I have come".

[136] 165; 6. The yĕ'n sucker-fish is quite abundant in the lakes of the Klamath highlands and has been identified by Prof. E. D. Cope as the Catostomus labiatus.

165; 7. yéwa. In Morgan's series of incantations there are song-lines on wind-gusts, tempests, rain-storms and on the winds blowing from each of the four cardinal [821] points of the compass. These latter are not positively stated to be producers of disease, though they are dreaded on account of their force and violence. The East wind (yéwash) blowing over the alkaline or volcanic, arid lands of Southern Oregon sings: yéwa, yéwa (nû) which does not only signify "I blow from the East", but also "I am howling".

165; 11. Feigning to draw a rope or string from their own posteriors is a trick sometimes resorted to by doctoring practitioners to make a disease disappear.

K
alternately tule and a small cat-tail (watcŏ'k), the wefts are cords 285
made of the rolled outer layer of the tule (called ḳ!o'ᴇgi). These wefts are placed in pairs in simple tabby weave at intervals of one to three inches; they are not twined. The wefts are so thin and so tightly drawn that they barely show in the finished mat, but they produce a checkerboard effect (sŏlŭmtai') which gives this variety of mat its name. Possibly there is a fourth variety called ak!a'lŏks, an open twined mat, but of this I am not certain. All these mats are provided with a border of twisted strands of the same material caught in the weft cords.

M
Blankets woven of strips of rabbit skin are made by Modoc, not 281
by Klamath.

Coville states that "a long time ago the bark [of the cottonwood, K
kō-osh', *Populus balsamifera* L.], when peeled and split, was used in 114
the manufacture of an Indian cloth."[313] What this fabric can be I 285
do not know, unless bags are meant. 173

Ropes are made of three braided strands. The material is grass or the outer husk of the tule for such rough work as carrying wood. K
Strips of hide are sometimes used, but little elk hide is available for 283
pack ropes. Finer cords, such as those for fish lines and nets, are made of nettle (slets) bark fibers, of which there are three or four varieties (or perhaps phases). Other plant fibers, such as the Rocky Mountain flax (kŏl'-ä-käms, *Linum lewisii* Pursh.)[314] make stronger cords. Brown and gray nettles are most commonly used because of their strength.[315] Swamp-grass cords are used for sewing mats. Barrett notes that string made of brown milkweed is but little used and that all string is formed of two strands twisted together.[316] The latter point is confirmed by my own observations. Cords are made by placing two strands, or a doubled strand, side by side on the bare thigh; rolling them separately under the palm by a movement up the thigh, and by a quick reverse movement down the thigh, without raising the palm, rolling one around the other. Cord-making is a woman's art. K
A rope is called pĕḳ!os and cord gᴇnŭ'ḳs; braiding is k!ᴇbŏ'k!a and [462]
rolling p'tc!Iŋ.

---

[313] Notes, 94.

[314] Coville, Notes, 99.

[315] Coville (Notes, 95) lists only one species, "the native species," *Urtica breweri* Wats.

[316] *Op. cit.*, 250. Coville indicates that milkweed (not, *Apocynum cannabinum* L.) does not occur in Klamath territory, but on Lost river where it is used by the Modoc (Notes, 103). K M [137]

The General Allotment Act

IN THE TREATY OF 1864, THE PROVISIONS FOR ASSIGNING INDIVIDUAL 648*
tracts had anticipated the more elaborate planning that twenty- 657*
three years later resulted in the Dawes—or General Allotment— 423
Act. The principal object of that legislation was to individualize the Indian by assigning him a private tract, to be held in trust by the United States for at least twenty-five years, and by granting him citizenship. In the minds of many, the act was a counterpart to the Homestead Act. Nickerson, arguing against the opening of Yainax as proposed in 1881 by a bill before Congress, had stated of the reservation:

> It is a rocky, volcanic country not one tenth of which would be
> taken under pre-emption or homestead laws were it thrown open [134]
> for settlement. It is impossible for any person to live and support
> a family on 160 acres of average land. It requires large ranges [137] •
> of this volcanic ashy soil to produce sufficient grass for an ordinary drove of cattle while a strip of low meadow land to produce hay and perhaps some grain is a necessity in successful stock raising in this climate.[1]

From the first, the news of imminent allotment was paired with the realization that left-over reservation lands were to be declared surplus and thrown open to purchase and homesteading by whites. The intelligence reached the Indians even while they were aroused by the barbed-wire encroachments of stockmen on the Upper End (which culminated in the slaying of a former member of the Indian police), coupled with disquieting rumors that the new government survey would exclude much of the valley of the Upper Sprague.[2] Fortunately, not until the following year did Emery receive instructions to evaluate

THE KLAMATH INDIANS OF SOUTHWESTERN OREGON.

BY ALBERT S. GATSCHET.

ETHNOGRAPHIC SKETCH OF THE PEOPLE.

INTRODUCTION.

101 The Klamath people of North American Indians, the subject of this
131 descriptive sketch, have inhabited from time immemorial a country upon
the eastern slope of the Cascade Range, in the southwestern part of the
133 territory now forming the State ot Oregon. That territory is surrounded
134 by mountain ridges and by elevations of moderate height, and watered by
streams, lakes, marshes, and pond-sources issuing from the volcanic sands
covering the soil. The secluded position of these Indians within their
mountain fastnesses has at all times sheltered them against the inroads of
alien tribes, but it has also withheld from them some of the benefits which
only a lively intercourse and trade with other tribes are able to confer.
132 The climate of that upland country is rough and well known for its sudden
changes of temperature, which in many places render it unfavorable to
● 137 agriculture. But the soil is productive in edible roots, bulbs, berries, and
136 timber, the limpid waters are full of fish and fowl, and game was plentiful
before the white man's rifle made havoc with it. Thus the country was
capable of supplying a considerable number of Indians with food, and they
never manifested a desire to migrate or "be removed to a better country."

128 The topography of these highlands, which contain the headwaters of the Klamath River of California, will be discussed at length after a mention of the scanty literature existing upon this comparatively little explored tract of land.

133 both form elongated troughs, and the waters escaping from them reach the lowlands through deep cuts in the resistant material. The difference lies only in this, that the drainage of the Klamath headwater basin has been less complete than that of the Sacramento and upper Pit River; and large portions of its surface are still occupied by bodies of water.

The lakes which show the location of longitudinal faults are the more shallow the more distant they are from the Cascade Range, and those which possess no visible outlet necessarily contain brackish water, as the alkaline materials in them are not removed by evaporation. It is a noticeable fact that those lakes which were nearest the seats and haunts of the Klamath Indians are all disposed in one large circle: Klamath Marsh, Upper and Lower Klamath Lakes, Rhett or Tule Lake, Clear or Wright Lake, Goose Lake, Abert Lake, Summer Lake, Silver Lake with Pauline Marsh. Besides this several other depressions now filled with marshes and alkali flats show the existence of former water-basins.

TOPOGRAPHIC NOTES.

The most prominent object of nature visible from the level parts of the Klamath Reservation is the Cascade Range with its lofty peaks. Seen from the east shore of Upper Klamath Lake, it occupies nearly one hundred and fifty degrees of the horizon. Though Shasta Butte, visible on the far south, does not properly belong to it, the ridge rises to high altitudes not very far from there, reaching its maximum height in the regular pyramid forming [137] Mount Pitt. This pyramid is wooded on its slopes, and hides several mountain lakes—Lake of the Woods, Buck Lake, and Aspen Lake—on its southeastern base. Following in a northern direction are Union Peak, Mount Scott, and Mount Thielsen, with many elevations of minor size. At the southwestern foot of Mount Scott lies a considerable lake basin about twenty miles in circumference, and at some places two thousand feet below its rim. The water being of the same depth, this "Crater Lake" has been pointed out as probably the deepest lake basin in the world (1,996 feet by one sounding), and it also fills the largest volcanic crater known. At its southwestern end a conical island emerges from its brackish waters, which is formed of scoriæ—proof that it was once an eruption crater. The altitude of the

133 a strong bubbling motion, without any indication of other springs in the vicinity. They are met with in soil formed of volcanic sands and detritus, have a rounded shape with steep borders, and form the principal feeders of the streams into which they empty. Ponds like these mainly occur in wooded spots. Some of them have a diameter of one hundred feet and more, and are populated by fish and amphibians of all kinds.

The lake region east of the Reservation was often visited in the hunting and fishing season by the Klamath Lake, Modoc, and especially by the Snake Indians Goose Lake was one of the principal resorts of the Snake and the Pit River Indians; and even now the numerous rivulets flowing into it make its shores desirable to American stockmen and settlers. Warner [103] (or Christmas) Lake, fully thirty-five miles in length, was once enlivened by the troops camping at Fort Warner, on its eastern side.* Chewaukan Marsh (Tchuaχē'ni) has its name from the tchuá or "water potato", the fruit of *Sagittaria*, and is by its outlet connected with Abert Lake.

The Indians of the Reservation annually repair about the month of June to Klamath Marsh (É-ukshi) to fish, hunt, and gather berries and wókash or pond-lily seed, which is one of their staple foods. Its surface is somewhat less than that of Upper Klamath Lake. Its shores are high on the southeastern, low and marshy on the northwestern side. Water appears at single places only, insufficient to warrant the marsh being called, as it often is, a lake.

137 The Oregonian portions of the country described belong politically to Klamath and to Lake Counties, the county seats of which are Linkville and Lakeview, on the northern end of Goose Lake. The latter place also contains a United States land office.

FLORA AND FAUNA.

Vegetation usually gives a characteristic stamp to a country, but in arid districts, as those of the Klamath highlands, it is rather the geological features which leave an impress on our minds The further we recede from

---

[113] * Goose and Warner Lakes are described in Lieutenant Wheeler's Report, Annual Report of Chief of Engineers, 1878 8°. Appendix N N, pp. 113–120. Goose Lake, by Stephen Powers, in "A Pony Ride on Pit River," Overland Monthly of San Francisco, October, 1874, pp. 342–351.

137 the Cascade Range and its more humid atmosphere the less vegetation is
developed. The lake shores and river banks, when not marshy, produce
the cottonwood tree and several species of willows, and the hills are covered
with the yellow or pitch pine and the less frequent western cedar. In the
western parts of the Reservation large tracts are timbered with pitch pine,
which seems to thrive exceedingly well upon the volcanic sands and
detritus of the hilly region. These pines (kō'sh) are about one hundred feet
in height, have a brownish-yellow, very coarse bark, and branch out into
limbs at a considerable height above the ground. They stand at intervals
of twenty to fifty feet from each other, and are free from manzanita bushes
and other undergrowth except at the border of the forest, leaving plenty of
space for the passage of wagons almost everywhere. A smaller pine species,
Pinus contorta (kápka, in Modoc k̲úga), which forms denser thickets near the
water, is peeled by the Indians to a height of twenty feet when the sap is
ascending, in the spring of the year, to use the fiber-bark for food. Up high
in the Cascade Range, in the midst of yellow pines, grows a conifera of taller
dimensions, the sugar-pine (ktéleam kō'sh). The hemlock or white pine
(wā'ko), the juniper (ktä'lo), and the mountain mahogany (yúkmalam) are
found in and south of Sprague River Valley.

[222] The lake shores and river banks produce more edible fruits and berries
[285] than the marshy tracts; and it is the shores of Klamath and Tule Lakes
[924] which mainly supply the Indian with the tule reed and scirpus, from which
the women manufacture mats, lodge-roofs, and basketry. The largest tule
species (má-i) grows in the water to a height of ten feet and over, and in
the lower end of its cane furnishes a juicy and delicate bit of food. Woods,
river sides, and such marshes as Klamath Marsh, are skirted by various
[222] kinds of bushes, supplying berries in large quantities. The edible bulbs,
as camass, k̲ō'l, l'bá, ipo, and others, are found in the prairies adjacent.
Pond-lilies grow in profusion on lake shores and in the larger marshes,
especially on the Wókash Marsh west of Linkville, and on Klamath Marsh,
as previously mentioned. The Lost River Valley is more productive in
many of these spontaneous growths than the tracts within the Reservation.

[278] It is claimed by the Klamath Lake Indians that they employ no drugs
of vegetal origin for the cure of diseases, because their country is too cold

137 278 to produce them. This is true to a certain extent; but as there are so many plants growing there that narcotize the fish, how is it that the country produces no medical plants for the cure of men's diseases? Of the plant shl!ē'dsh, at least, they prepare a drink as a sort of tea.

136 192 The fauna of the Klamath uplands appears to be richer in species than the vegetal growth. What first strikes the traveler's attention on the eastern shore of the Upper Lake is the prodigious number of burrows along the sandy road, especially in the timber, varying in size from a few inches to a foot in diameter. They are made by chipmunks of two species, and others are the dens of badgers, or of the blue and the more common brown squirrel. The coyote or prairie-wolf makes burrows also, but this animal has lately become scarce. No game is so frequent as the deer. This is either the black-tail deer, (shuá-i, *Cervus columbianus*), or the white tail deer (múshmush, *Cariacus virginianus macrurus*), or the mule-deer (paḵóleah, *Cervus macrotis*). Less frequent is the antelope (tché-u, *Antilocapra americana*), and most other four-legged game must be sought for now upon distant heights or in the deeper cañons, as the elk (vún), the bear in his three varieties (black, cinnamon, and grizzly; witä'm, náka, lû'ḵ), the lynx (shlóa), the gray wolf (kä'-utchish), the silver or red fox (wán), the little gray fox (ḵétchḵatch), the cougar (táslatch), and the mountain sheep (ḵó-il). Beavers, otters, minks, and woodchucks are trapped by expert Indians on the rivers, ponds, and brooklets of the interior.

The shores of the water-basins are enlivened by innumerable swarms of water-fowls, (mä'mäkli), as ducks, geese, herons, and cranes. Some can be seen day by day swimming about gracefully or fishing at Modoc Point (Nflakshi) and other promontories, while others venture up the river courses and fly over swampy tracts extending far inland. Among the ducks the more common are the mallard (wē'ks), the long-necked kflidshiks; among the geese, the brant (lálak) and the white goose (waíwash). Other water-birds are the white swan (kúsh), the coot or mudhen (túhush), the loon (táplal), the pelican (yámal or kúmal), and the pinguin (kuftsia). Fish-hawks and bald-headed eagles (yaúχal) are circling about in the air to catch the fish which are approaching the water's surface unaware of danger. Marsh-hawks and other raptores infest the marshes and are lurking there

133 the highest peaks confirm the eruptive origin of these mountains. The pure azure sky and the perpetual silence of nature reigning in these uplands add impressions of grandeur which it is impossible to describe. The sense of the beautiful has no gratification in the austere forms of these mountains, but the blue and limpid waters of the lakes, their numerous islands, and the lovely green of the shores, delight it in the highest degree.

137 The other eminences perceptible on the horizon lack the boldness of
137 outline seen upon the main ridge, and with their dusky timbers deeply contrast with it. They seem monotonous and commonplace, and people easily impressed by colors will call them somber. The open country, whether marshes, plains, clearings, meadows, or bare hills, presents an extremely bleak aspect, especially when under the influence of a hot summer sun. Its unvarying yellowish hue, produced by the faded condition of the coarse grasses, renders it monotonous.

133 The solitude and serenity of these places exercise a quieting influence upon the visitor accustomed to the noisy scenes of our towns and cities. Noiselessly the brooks and streams pursue their way through the purifying volcanic sands; the murmur of the waves and the play of the water-birds, interrupted at times by the cry of a solitary bird, are the only noises to break the silence. Beyond the few settlements of the Indian and away from the post-road, scarcely any trace of the hand of man reminds us of the existence of human beings. There Nature alone speaks to us, and those who are able to read history in the formations disclosed before him in the steeper ledges of this solitary corner of the globe will find ample satisfaction in their study.

132 The Klamath plateau, though productive in game, fish, and sundry kinds of vegetable food, could never become such a great central resort of Indian populations as the banks of Columbia River. The causes for this lie in its secluded position and chiefly in its climate, which is one of abrupt changes. The dryness of the atmosphere maintains a clear sky, which renders the summer days intensely hot; the sun's rays become intolerable in the middle of the day at places where they are reflected by a sandy, alkaline, or rocky soil and not moderated by passing breezes. Rains and hailstorms are of rare occurrence, and gathering thunder clouds often dissolve or "blow

7:Gatschet E-4,5 (1877) 1890 NR10 Klamath NR10

*539 94, 4. I-ulalónan or Yulalóna is the Indian name of the cascade of Link River
773 above the town of Linkville, and for that town itself. The origin of this name is ex-
192 plained in 94, 5. 6, for the verb i-ulalóna means to move forth and back, referring here
193 to the waters of the river receding under the pressure of the south wind.

103 94, 6. ítklank, partic. pres. of itkal, means here: obtaining by basketfuls.

137 94, 9. The kĕnáwat is a plant growing high in the warm climate of Northern California, especially in the ancient habitat of the Shasti Indians, and in this myth it suggested itself to the Indians on account of its property of growing very fast.

95, 3. gé'hlapka: he swung himself into the nest by climbing over the rim. Cf. *Note* to 68, 13.

95, 10. kaiχema K'mukámtchish for the regular form K'mukámtchash. Cf. 91, 8.

95, 15. skáyamtch etc. More plainly expressed this sentence runs as follows: sha skáyamna pásh tchish ámbu tchish; the first tchish being placed before pásh and appended to the apocopated skáyamna.

95, 16. shéwana here used differently from tchíya, which applies to liquids only.

95, 17. p'lû' ítchuank seems to be a quite modern interpolation, for it smells of pomade and hair-oil; but it is as ancient as the myth itself.

765 95, 23. 96, 2. 3. 4. Tchíka. I have rendered this bird-name elsewhere by "Chaffinch," and Klétish by "Sandhill Crane".

551 96, 3. shlámia, to feel insulted. She resented it as an insult that the child called her deceased husband by name; for it was a capital crime among the ancestors of the present Klamaths to call a dead person's name for many years after his demise.

96, 5. hû'tna is changed to hû'tan on account of being followed by a word commencing with k.

765 93, 6. stiya. The custom of widows to put pitch or resin on their heads at the death of their husbands was abolished only at the time when cremation became a thing of the past.

178 96, 6. galdsha-úyank is a more explicit form of the participle; the verb gáldshui being the contracted form of galdsháwi.

96, 8. yámnashla. He used the bristles of porcupines to make necklaces of.

96, 11. unakáka m'na was the son of Aíshish and of the above mentioned Tchíka.

96, 11. 12. K'mukámtcham qualifies pā'ks, not lúlukshtat.

96, 14. pakakóleshtka, verbal desiderative of pakakóla, to jerk away from. The suffix -óla indicates that K'múkamtch wore his tobacco-pipe tied to his body; he wore it on his neck.

96, 15. tchitchiks is used when speaking to children. It signifies *so, so!* and means: be quiet, shut up, stop!

96, 17. tchē'k kĕléwi. In similar connections this phrase very frequently ends a whole narrative in Modoc and Klamath. Here it means that Aíshish ceased to poke the pipe into the fire. Cf. 85, 10. 89, 7.

96, 18. medshá: he removed from that spot with all his wives and children. Ancient customs forbid the offspring to stay where the father had breathed his last.

96, 20. Gén húnk nánuk etc. This portion of the myth describes the destruction of all the living organisms on earth by a general conflagration caused by K'múkamtch. Myths of this kind are suggested by intense heat experienced in summer. This mode of destroying life on earth is less frequently met with in myths than the drowning in a general flood.

K
M
342 of the house head, whose bed is toward the front, while an old
352 lady or two, perhaps his widowed mother, sleeps toward the
513 back. Along the opposite wall range the sleeping mats of another
K family, sometimes one related to the house head. There are
M [592] houses that hold more than two families and others that hold
K only one. The very poor together with the aged who can no
M longer make their way up and down the ladders must be content
342 888 to shiver out the winter in mat lodges.

735 Many of the people of our earth lodge, and the younger women
K now bringing in the food which hospitality dictates be offered
M 142 the visitor[11] are of powerful frame—though of no more than
average height—and some tend to portliness.[12] They are scantily
K clad for this climate: both men and women clad in fringed fiber
M skirts and basketry caps, differing only in style. In the early
291 nineteenth century, a few would be wearing buckskin clothing
[177] and footwear of the style then being communicated down the
trade routes from the distant Plains across the Rockies and down
the Columbia. Those preparing to brave the weather outside
add tule leggings, woven tule sandals stuffed with dry grass, a
K mantle of skin or fiber, and fur mittens. Their hair is dressed in
M 302 braids, that of the men wrapped in the new fashion with strips
301 of otter fur. Both sexes wear necklaces of shells or stone beads,
ear pendants, and a dentalium shell thrust through the septum
K of the nose. Many have a flattened brow, cultivated in infancy
M upon the cradleboard; and several have designs on the face,
304 limbs, and body tattooed according to no particular pattern by
[142] rubbing charcoal into incisions or punctuations. The latter prac-
[177] tice, says Ray, was a recent importation from the Shasta and Pit
River neighbors of the Modoc.

K Morning in the winter village comes early for the older boys.
M 512 Before sunup they are prodded out of bed by a father or grand-
[857] father and sent for a roll in the snow, a plunge in the frigid black
waters of the stream, and a run upon its banks. By the time the
sun climbs above the snow-laden trees, women have begun to
stir, arranging their hair, raking up the fire, lifting a baby on its
K M cradleboard to nurse. In the cooking lodge, others are heating the
[252] stones that, dropped into a basket of mush, will soon cause it
[415] to boil. The watertight cooking baskets are treasured, for they
[177] have come in trade or as loot from peoples to the south. Families

*648 in seventh and ninth grades—the beginning grades respectively
*657 for junior high and high school—was less than half the figure for
87 first grade in the same year. For tribal children, by contrast, the
563 figures for the advanced grades were each almost twice as large
as that for the first grade.

On an average, roughly one-half the small number of Klamath
children entering high school could be expected to graduate.
[125] That this record was not to be attributed to a difference in intellectual ability is intimated by the results of California mental maturity tests which, as administered to Klamath children as a whole at the fourth grade, yielded normal scores, averaging 96.9. When, however, the same children had reached the eighth grade, their average score had declined to 80.4.[6] A sharp drop in incentive had taken its toll.

The stresses within the school fell unequally upon Klamath boys and girls. Athletic prowess and artistic ability—both often conceived as racially innate and as masculine attributes—gave the boys legitimate avenues to social approval. At puberty, however, Klamath girls were often beginning to develop the physical
[142] massiveness that is so frequent in their racial constitution, but
[562] that at the same time is foreign to American ideals of beauty.
Some bore their lot with dignity and poise. Others courted a fleeting favor through promiscuity or took out their resentments in direct assault upon rivals or upon substitute figures. Direct violence against whites occurred in the schools at about this age, and most frequently involved girls. Still others sought alternatives outside the school, dropping out entirely, going away to vocational schools, or entering into early marriages.

*648 Indeed, for many of the tribal youth—boys as well as girls—
*657 confronted by a school experience that grew increasingly irrele-
871 vant as they became older, it was merely a matter of "serving
563 time" until they gained release by attaining the age of eighteen.
582 Many Klamath tended to marry young, and there were incentives
peculiar to their position. For a girl striving to escape the pressures and dissatisfactions of home life, the regimen of caring for younger siblings, and the boredom and vexation of the school, the importance and security of being a newlywed possessed a
[434] fairyland appeal. For the boy, the trust fund accumulated by
[429] the Agency for each minor, amounting in some instances to

GRINDING AND SIFTING WOKAS SEEDS.

[p. 267]

000 staying before the Modoc war among the *Kúmbatwash-Modocs* (q. v.) in the lava beds south of Tule Lake.

A few families of hunting *Molale Indians*, congeners of the "Old Kayuse" Indians near Yumatilla River, were formerly settled at Flounce Rock, on the headwaters of Rogue River, and farther north in the Cascade range. The Klamath Indians were filled with hatred against them; they were by them called Tchakä'nkni, inhabitants of Tchakχē'ni, or the "service berry tract," and ridiculed on account of their peculiar, incorrect use of the Klamath language. In former times Molale Indians held all the northeastern slopes of the Willámĕt Valley, claiming possession of the hunting grounds; the bottom lands they left in the hands of the peaceably disposed, autochthonic race of the Kalapuya tribes, whom they call Mókai or Móke.

CHARACTERISTICS OF RACE.

142 These are either bodily or mental. To ascertain the former no measurements were made by me by means of instruments when I was among the Klamath Lake Indians, and hence all that follows rests upon ocular inspection. For Modoc skulls some accurate data are on hand, published by the United States Surgeon-General's Office, Washington, D. C.

The Mongolian features of prognathism and of high cheek bones are not very marked in this upland race, though more among the Modocs than in the northern branch. If it was not for a somewhat darker complexion and a strange expression of the eye, it would be almost impossible to distinguish many of the É-ukshikni men from Americans. The forehead is compressed in the tender age of childhood and looks rather low, but does not recede so acutely as might be expected from this treatment. Prognathism, where it exists, does not seem to be a consequence of head flattening. The cheek bones are more prominent than with us, but less than with the Central Californians. The fact that the head-man, Tatápkash, who was among the signers of the treaty of 1864, was called after this peculiarity shows that high cheek bones are rather uncommon. The nasal ridge is not aquiline, but very strong and forms an almost continuous line with the forehead. Convergence of the eyes is perceptible in a few individuals only, and anatomists have shown that it is nowhere produced by the structure of the skull

142 itself, but it is the result of the mother's manipulation on the baby's eyes, and causes them to look sleepy, the opening of the eyelids becoming narrower. (Cf. Texts 91, 5–8.)

These Indians have a piercing look and their eyeballs are of the deepest black, a circumstance which accounts for their great power of vision. In many Indians, namely in children, the white of the eye shows a blue tinge, perhaps the result of head flattening. The mouth is small and the teeth good; but with many Indians the thyroid cartilage, or Adam's apple, is very [302] prominent. The hair upon the head is straight and dark. I did not find it very coarse, but with many Modoc women it is said to be so and to grow to an extreme length. On other portions of the body the hair is short and scarce, the natives doing their best to weed it out, the beard especially, with metallic pincers or tweezers (hushmoklō´tkish), which they always carry with them. As among most American aborigines, the beard is of scanty growth. The late chief Lelékash wore a beard, but I never saw any Indian wearing one except Charles Preston, the Yáneks interpreter. The contents of the song 185;44 should also be noticed in this connection. Baldness is rare, and in fact it appears that the dearth of hairy covering of the skin is fully compensated in the Indian race by a more exuberant growth of hair upon the head, to protect them against excessive colds and the heat of the sun.

Among the Lake people the complexion is decidedly lighter than among the cinnamon-hued Modocs, and a difference between the sexes is hardly perceptible in this respect. Blushing is easily perceptible, though the change in color is not great. Those most approaching a white complexion like ours are numerous, but their skin is always of a yellowish lurid white. Owing to their outdoor life in the free and healthy mountain air, these Indians are well proportioned as to their bodily frame, and apparently robust; but their extremities, hands and feet, are rather small, as the extremities are of the majority of the North American Indians.

The average of Modoc men appear to be of a smaller stature than that of the Klamath Lake men, but in both tribes a notable difference exists between the length of body in the two sexes, most men being lank,

142 tall, and wiry, while the women are short and often incline to embonpoint. Nevertheless obesity is not more frequent there than it is with us. No better illustration of their bodily characteristics can be had than a collection of their personal names. These sketch the Indian in a striking and often an unenviable light, because they generally depict the extremes observed on certain individuals. The sex can not, or in a few instances only,
[551] be inferred from the name of a person. We frequently meet with designations like "Large Stomach," "Big Belly," "Round Belly," "Sharp Nose," "Grizzly's Nose," "Spare-Built," "Grease," "Crooked Neck," "Conical Head," "Wide-Mouth," "Small-Eyes," "Squinter," "Large Eyes," "Half-blind," or with names referring to gait, to the carriage of the body, to habitual acts performed with hands or feet, to dress, and other accidental matters.

165 With all these deformities, and many others more difficult to detect,
145 these Indians have bodies as well formed as those of the Anglo-American race, and in spite of their privations and exposure they live about as long as we do, though no Indian knows his or her age with any degree of accu-
164 racy. A very common defect is the blindness of one eye, produced by the smudge of the lodge-fire, around which they pass the long winter evenings.
304 With the majority of the Indians the septum of the nose hangs down at
301 adult age, for the nose of every Indian is pierced in early years, whether they afterwards wear the dentalium-shell in it or not.

000 Stephen Powers, who had good opportunities for comparing the Modocs with the tribes of Northern California, says of them:

> They present a finer physique than the lowland tribes of the Sacramento, taller and less pudgy, partly, no doubt, because they engage in the chase more than the latter. There is more rugged and stolid strength of feature than in the Shastika now living; cheek bones prominent; lips generally thick and sensual; noses straight as the Grecian, but depressed at the root and thick-walled; a dullish, heavy cast of feature; eyes frequently yellow where they should be white. They are true Indians in their stern immobility of countenance.*

Passing over to the psychic and mental qualities of these Oregonian natives, only a few characteristics can be pointed out by which they differ from the other Indians of North America. The Indian is more dependent

---

* Contributions to North Amer. Ethnology, III, 252, 253. By Shastika he means the Shasti Indians of middle Klamath River, California.

[Pp. 124-125 contain no ethnographic material]

*657
*648 tunities of the reservation. As they moved away, they extended
563 Indian experience into the midst of frontier society. During the
167 allotment period they in turn enlarged reservation perspectives.

*657 The majority of the interbreed children that appeared upon
*648 the early reservation, then, were the product of temporary or
563 unstable unions and appeared as fatherless children. The annual
162 reports are unrealistic as to their number. In 1885, for example, it was claimed that there were only 12 interbreeds in the total population of 919,[9] although to judge from later censuses, the number must have been several times as great.

*657 One of the long-range results of this intercourse was to reduce
*648 somewhat the difference in physical appearance that separated
563 the Indians from the surrounding population. Another—and more
[144] immediate—consequence, however, was to raise the divisive issue
[848] of illegitimacy among the Indians themselves and to introduce
[602] into the tribal body individuals who could claim only maternal kinsmen. Thus, one Klamath recalls his father, a stage driver in Klamath Falls, as a drunkard whom his mother finally left. The family returned to his maternal grandparents, in whose care the boy grew up. His mother subsequently married a man who ran a logging camp at Pelican Bay, a hard worker and good hunter who treated the boy well. Nonetheless, throughout his life he bore an animus against his father and in part against the heritage he represented.[10]

*657 Interracial unions were encouraged, not only by a dearth of
*648 white women but by an early preponderance of women among
563 the Klamath and by regulations which put an end to polygamy.
167 The early imbalance between the sexes was striking. The figures
[595] supplied by Captain Kelly for the adult Klamath in 1864 give a sex ratio of no more than 0.47.[11] Those for the Link River band two years later areonly a little higher for the adults, 0.52, although the overall figure is 0.64, since boys and girls are in approximate balance.[12]

[164] Neither sex-linked disease nor the practice of selective infanti-
[847] cide is known to have occurred among the Klamath, and the most probable explanation must be sought among such factors as differential exposure to rigorous training, warfare, and vicissitudes of the food quest, as well as to possible emigration of single men. O. C. Applegate, the only Agent to comment upon the im-

men. The major attractions, however, were the stores, the schools, 648* 657*
the movies, the excitement, and the entertainment. These advantages 16
seem likewise to have favored the shift to larger communities.

Thus, over an extended period of time, there has been a substantial and growing body of Klamath who, while retaining an equity in the tribal estate and membership in the tribal body, have come to dwell away from the reservation and who visit it infrequently, if at all. Their daily life is spent within a milieu, and in reliance upon a "personal community"—to use Jules Henry's expressive term[5]—made up largely of non-Klamath.

The heterogeneity of the Klamath is also reflected by their 648*
biological composition. While the characterization of the degree 657*
of Indian heritage, expressed as a "blood quantum," is open to 144 •
occasional error in individual instances, the figures taken in summation reveal significant differences. By 1955, only twenty-eight per cent of the absentee members could claim to be biologically of over one-half Indian ancestry, and even for those dwelling upon the reservation the corresponding figure was no more than fifty-four per cent. Within the reservation, in turn, Lower End Klamath were markedly less Indian by this measure, falling between the values for absentee and Upper End members.[6]

Like many other Indian groups, the Klamath population possesses 648*
a large segment of younger members, marking an increase 657*
over the early decades of the present century. In the days of 162
termination, those under twenty years of age comprised no fewer than forty-seven per cent of the total tribal membership, a figure exceeding that for the general population of the United States, of which only one-third fell within the corresponding bracket.[7] Although these figures are often interpreted as reflecting improved health conditions on the reservation, they also [563]
reflect an increased rate of marriage with non-Indians.

The variety of Klamath life during the latter days of their 648*
tribal existence may be illustrated by data from the Upper End 657*
community of Beatty, the Lower End city of Chiloquin, and 184
from the off-reservation communities of Klamath Falls and 361
Eugene-Springfield in the Willamette Valley.

Beatty and Chiloquin represent special facets of reservation

4. See n.3 for tabulation.

5. Henry (1958).

6. The figures come from a demographic review of a sample of tribal members above the age of sixteen, made as part of the Klamath Termination Study. For this restricted sample, the proportion of reservation population one-half or less in Indian heritage is 33 per cent. When calculated separately, the Lower End segment stands at 41 per cent, almost double the figure for the Upper End, with 24 per cent. 648* 657* 162 144 •

Available figures have made it necessary to compare the reservation and absentee memberships over the full age range, rather than to restrict consideration to those above sixteen. Upon this base, the over-all value for the reservation increases from the figure given above to 46 per cent, while that for the absentee membership, 72 per cent, is almost double. Thus the Lower End stands biologically intermediate between Upper End, with the highest Indian heritage, and the absentee segment, with the lowest.

7. Hadley (1957), p. 29. The figures for the United States are for 1957. 000

8. Du Toit (1959).

9. Stern and Swanson (1960).

648 Most Klamath live in one or another of the several
towns and settlements on the reservation, or else they have settled elsewhere,
361 in Portland, Salem, Eugene, in California, in Alaska, in the Midwest, or along
[167] the Atlantic seaboard. In 1955 the Tribe had 2118 members, and of these 40
percent lived away from the reservation (Stern & Swanson 1960). Partly because
[619] of the recent progress of the termination of federal supervision of the reservation, by this date the percentage of members residing off the reservation has
[161] probably increased. In fact, for years there have been numerous "tribal members" with no experience whatsoever of reservation life.
[619]

648 Throughout the years of White contact inter-marriage and inter-breeding have
been frequent. Today, more than 70 percent of the Tribe's members are, gene-
144 tically, less than one-half "Indian," and less than one sixth are "full-bloods."
[171] Many are indistinguishable in appearance from their White neighbors, as most are
not easily distinguished in dress and language.

175 The isolation of the early reservation period was soon removed by the influx
177 of White settlers, who at first took up farms and started towns near the fringes
of the reservation. Through inter-marriage and through the consequences of
[361] allotment of land to individual Klamath, many Whites were soon residing within
the reservation's boundaries, either on the lands of a spouse, or on land bought
[423] or leased from tribal members. Another source of change were the ever present
efforts of Agency officials to make over aboriginal ways, and later, the rapid
[657] growth of the lumber industry and the development of full fledged frontier com-
munities were also important sources of acculturative influences. In quick
[726] succession the Klamath experienced a period of armed conflict (the Modoc War of
1872-73), a religious revivalistic movement such as that which swept the plains
[786] area, extensive governmental planning and intervention, the allotment of land
in severalty, and a growing participation in the cash economy. Because aboriginal
[181] Klamath values had stressed achieved status for those who worked to accumulate
wealth and property, for some Klamath the early period of contact provided in-
[556] creased opportunities, and there was a group of men who for a time were effective
[436] entrepreneurs. It was through such personal efforts and through the "easy money"
had from private sales or the leasing of agricultural lands, from pro rata shares
of boundary settlements, and from per capita payments for sales of tribal timber
that the Klamath made the transition to a money economy.

648 The participation in and contribution of the Klamath to the economy of the region
is a significant point of interchange between Klamath and White, and one with
[313] many ramifications. In considerable measure, the local timber industry prospers
[423] or slumps, depending on the allotted cut in the tribal forest. Similarly,
local merchants are somewhat dependent upon the assured income of tribal mem-
[434] bers, as they are upon the purchases of mill workers, fallers, and cat-skinners.
The major town on the reservation, Chiloquin, obtains the largest share of its
[632] revenue from sales at a municipally owned beer-hall and from the fines and for-
[251] feited bails paid by visitors to the city jail, both of which establishments are
patronized largely by Klamath.

648 In other aspects of community life the participation of Klamath is perhaps best
621 characterized as that of passive spectators. Many Klamath have come to have a
sense of being aliens in the heterogeneous local culture, although there is a
563 small assimilated minority.

[591] Thus Klamath may interact as equals in card rooms and pool hall, and are met
with a stereotyped "friendliness" in interactions in stores and on the street.
However, the great majority live in intimate interdependence separate from the
main currents of White social life. White ethnic exclusiveness is reflected

142 tall, and wiry, while the women are short and often incline to embonpoint. Nevertheless obesity is not more frequent there than it is with us. No better illustration of their bodily characteristics can be had than a collection of their personal names. These sketch the Indian in a striking and often an unenviable light, because they generally depict the extremes observed on certain individuals. The sex can not, or in a few instances only, [551] be inferred from the name of a person. We frequently meet with designations like "Large Stomach," "Big Belly," "Round Belly," "Sharp Nose," "Grizzly's Nose," "Spare-Built," "Grease," "Crooked Neck," "Conical Head," "Wide-Mouth," "Small-Eyes," "Squinter," "Large Eyes," "Half-blind," or with names referring to gait, to the carriage of the body, to habitual acts performed with hands or feet, to dress, and other accidental matters.

165 145 With all these deformities, and many others more difficult to detect, these Indians have bodies as well formed as those of the Anglo-American race, and in spite of their privations and exposure they live about as long as we do, though no Indian knows his or her age with any degree of accu- 169 racy. A very common defect is the blindness of one eye, produced by the smudge of the lodge-fire, around which they pass the long winter evenings. 304 With the majority of the Indians the septum of the nose hangs down at 301 adult age, for the nose of every Indian is pierced in early years, whether they afterwards wear the dentalium-shell in it or not.

000 Stephen Powers, who had good opportunities for comparing the Modocs with the tribes of Northern California, says of them:

> They present a finer physique than the lowland tribes of the Sacramento, taller and less pudgy, partly, no doubt, because they engage in the chase more than the latter. There is more rugged and stolid strength of feature than in the Shastika now living; cheek bones prominent; lips generally thick and sensual; noses straight as the Grecian, but depressed at the root and thick-walled; a dullish, heavy cast of feature; eyes frequently yellow where they should be white. They are true Indians in their stern immobility of countenance.*

Passing over to the psychic and mental qualities of these Oregonian natives, only a few characteristics can be pointed out by which they differ from the other Indians of North America. The Indian is more dependent

000 on nature, physically and mentally, than we are.. What distinguishes the civilized man from the primitive man of our days and of prehistoric ages is his greater faculty of turning to account the patent and the hidden powers of nature, or the invention of handicrafts, arts, and sciences. In this the savage man lags far behind the man of culture, and although we often have to admire the ingenuity and shrewdness displayed by the American native in his hunting and fishing implements and practices, the art of agriculture, without which there can be no real human culture, has never been pursued to any considerable extent by the Indians living north of the thirtieth parallel of latitude.

512 The climate of their home compels the Máklaks Indians to lead an
157 active and laborious life. Except in the coldest days of winter they are
● [147] almost always engaged in some outdoor work, either hunting, fishing, or cutting wood, gathering vegetal food, or traveling on horseback. Pursuits like these and the pure, bracing air of the highlands render their constitutions hardy and healthy, their minds active, wide awake, and intelligent. They are quick-sighted and quick in their acts, but slow in expressing delight, wonder, astonishment, or disgust at anything they see. Often they do not grasp the meaning of what they observe being done by the white people, and thus appear to us indifferent to many of the highest attainments
177 of modern culture. Children and adults are prone to reject or slow to adopt
[178] the blessings of civilization, because many of these are of no practical use to a hunting and fishing people, and others are past their understanding.

The first things they generally adopt from the white people are the citizen's dress and handy articles of manufacture, as beads, tobacco, knives, guns, steel traps; also wagons and other vehicles; for when in possession of these last the horses, which they had obtained long before, can be put to better account They are also quick in adopting English baptismal names, sometimes discarding but oftener retaining their descriptive or burlesque nomenclature from the Klamath language. Gradually they adopt also with the money of the white man the elements of arithmetic, and learn to compute days and months according to his calendar. After another lapse of time they introduce some of the white man's laws, discard polygamy and slavery,

121 (Levine, 1960) has indicated that this may be an extremely important measure
125 of ego strength. Whether this is supported in cross-cultural work remains to
[114] be determined.

121 The emphasis throughout this phase of the research has been on the functioning
individual — how he adapts to his environment in general and, whenever possible,
15 how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application
is often very helpful and may have led to the most important conclusion of the
156 present investigation: that the Klamath are characterized by a guarded and
[171] restrained approach to life and interpersonal relations. This guarded restraint is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

000 that woman; he acts just like a boss toward her."

3975. WT: Also, in Upper Trinity subarea of Wintu, informant had heard of 1 instance of mother-in-law killing daughter-in-law after husband died. "The mother-in-law didn't want that woman to take another husband, so she killed her with a bone needle [dagger?]. She was sorry after she did it; but she didn't like the woman having another husband who would look just like her son; it would make her [mother-in-law] feel badly."

[587] 3976. In case there is no brother-in-law to ask.

3977. If there is no brother-in-law to receive the payment. AW: Sister-in-law may dispose of widow to more-distant male relative of dead husband also.

3980. SW: A divorce "puts a man and woman clear away from each other"; no payment rendered former husband.

562 587 593 3981. Kl: If man does not like his wife for some reason, he announces, "Anyone who wants my wife can take her, if they give me something. If you people don't want her, I'll kill her." The men discuss it; husband repeats the announcement, sets date when he will kill woman; some man finally takes her for wife, gives the husband something; "that's how they save a woman, sometimes." No one knows what trouble between husband and wife prompts man to do this, and man never tells; he doesn't beat his wife, he just sells her. Only done occasionally; when informant was boy such sales still taking place; informant had seen one couple separated this way. Woman not captive.

000 Intercourse; promiscuity.--

3984. NF: Girl cries, fights husband, so girl's mother sleeps beside girl first night later sleeps with husband.

3985. NF: Do not allow people to sleep lying on back "like dead people"; lie on side and "put their heart in hiding" so no evil will befall sleepers.

● [152] [192] 3987. Purse lips and make sound, "čk, čk," repeatedly, close to baby's face. AW: Rub hands over baby's face or neck while making sound; same done between adults. AE: "Learned to make this sound from animals--badger, raccoon."

3988. SE: No virginity tests, but observe boy's actions around girls. AE: If girl's, boy's legs get "heavy" (tired) during girl's puberty dance, sign he or she is not virgin. Spectators watch to see whether this happens. WT: Can tell whether girl is virgin or not by shape of her abdomen, if firm, smooth, judge she is.

[548] [178] 3989. Kl: Prostitution with payment recent custom only.

3990. WM: Especially at girl's puberty dance.

836 3991. Kl: Said to have been extremely rare; "girls never ran around; pretty hard to get a woman." Girl's parents wanted girl to marry man who could get her lots of fish, so she would eat

[Klamath Reservation]

K M 609 In such a sphere, and in relations with strangers beyond, the myths picture encounters fraught with possible danger. They may be initiated by a trucial period which endures until, by proper guest-host behavior, by a claim of kinship or on the other hand by an act of aggression, the issue of "friend or foe" is precipitated. K M [574] Hospitality dictates that one receive and feed the stranger, though a visiting kinsman brings a gift of food or otherwise repays the kindness. If, however, hostility is decided upon, it rarely becomes open: instead, both sides proceed indirectly, under the guise of amicability, and employ followers or auxiliaries to encompass the destruction of the other. It is here that the prescient qualities of the hero, his access to assistants and to supernatural forces, are decisive.[19]

K 648 In ethnographic reality, the outer limits of society are marked by the boundaries of common speech. Beyond this, the Klamath maintain amity with the Molala, intermittent friendship and hostility toward the Warm Springs and other Columbia River Sahaptin, who sometimes raid them, and toward the Paiute; inveterate hostility toward the Takelma of the upper Rogue and other peoples west of the Cascades; and a predatory aggressiveness toward the Pit River and Shasta to the south, whom they increasingly raid for slaves and loot.

K M 571 156 [838] The horizons of such a society are not wide. With the exception of the shaman, a part-time specialist, each man and each woman has much the same skills and knowledge as his fellows. The aberrant individual can do no more than assume the dress and behavior of the other sex, ascribing his action to supernatural dictate. The transient forms of the community and the informal constraint it imposes, the paucity of activities that demand concerted action, go hand in hand with a permissiveness in the individual. When this takes aggressive form, it may threaten the very fabric of society.

K M 754 571 • 152 682 The covert expression of hostility is likely to invest relations beyond the natal family with fear and mistrust. Revenge can take the form of murder from ambush, sorcery to engender the illness or death of the enemy, or the stealthy destruction of his property.[20] One frequent cause of open slayings, and of the feuds that ensue, is suspicion that a shaman has brought about the death of one's kinsman. Commonly, such charges are leveled

against a member of another band or tribe, but malevolence or greed, it is thought, may sometimes lead a shaman to compound the illness or death of a fellow bandsman; and sometimes his spirits may act independently of him to bring the same end. Klamath recall with horror the unnatural event which took place in the present decade of the present century, when that suspicion caused a woman to slay her own mother for the fatal bewitchment of her child.

To end a description of the aboriginal life of Klamath and Modoc in this manner is to risk too somber a balance. Loosely structured in society, modest in scale, precariously balanced against the winters, their cultures made possible a good life in which dignity and worth had a place. That those were not, however, the halcyon days sometimes depicted today is intimated by the words spoken in 1873 by the Klamath leader, Henry Blow. If they exaggerate as almost certainly they do, they still possess an essential truth:

K

829

> Before the Bostons came there was no law. The strongest man took what he wanted and the man who had the most property and the most friends was the chief. It was a bad country in those times. Some men were bad and took away the property of other men. If a man was poor and had no friends, and had a beautiful squaw, some stronger man would steal his squaw and kill him if he resisted.[21] Might was right in those days and there was much fighting and killing everywhere. If a man was jealous because another was getting rich and had many friends, he would steal into his lodge and kill him when he was asleep, or lay in ambush to kill him as he went by. Those were bad times as we see now, since the Bostons have come and made law to protect every man's rights and property.[22]

their resolution. Just as clearly, she is extremely discouraged and demoralized. During the course of testing and questioning she was manifestly anxious from time to time, this being evident from a slight stammer, frequent parapraxes, and a tendency to over correct for errors. To the blank TAT card, #16, she told a story of a girl's reaction to the death of her mother and then cried painfully, trying to control herself.

(9) Whole. () Just the way it was shaped.

*159
156 and anxiety associated with her responsibility in a double murder. She had
given a rifle as a present to a lover, and following a drinking party at her
house he had killed his brother and a stranger with it. Her thinking was extremely morbid. She expresses the wish that the more violent of her previous
husbands would return and kill her.

*159 In the testing and interview sessions Nell's behavior quite definitely was not
157 representative of her ordinary interactions, and once she felt somewhat relieved
she immediately got more distant, withdrawn, and unapproachable. During testing
[124] she exhibited a high level of manifest anxiety and an erratic pattern of interaction. She was alternately over-talkative and quick to reply or to initiate
•[152] a sequence, and then silent and down-cast. Her concern was real, for it was
known that she was under suspicion for complicity in the murder, but this was
not the root of her anxiety. What the connection was cannot be evaluated from
available evidence, but it may be that her conflicts were related to the trouble
her lover had gotten into, for it was his situation she wanted most to talk
[156] about. Normally she is relatively inflexible in her relationships and preserves
her withdrawn and isolated position at all costs. Her behavior then exhibits
a high level of drive, but is poorly organized, confused as to goals, and produces repeated overt conflict with lovers, husbands, her parents, her children,
work associates, other community members, and law enforcement agents. Still,
she expresses the need to be cared for and dominated consciously, as well as the
156 feeling that she was being persecuted and rejected. She feels herself to be an
entirely worthless person, and this evaluation is shared by the community at large.

Rorschach Record

125 Note: With little variation between cards, each was approached by the S. in
*159 the following manner: She would take the card, repeatedly twist it and turn
it, swiftly cover portions of the blot with her hand or fingers, hold it at
arms length, hold it closer and examine it carefully, lay it down momentarily
and stare off "thinking," and then after a silent delay of an average 145" spit
out a series of responses rapidly, as if they were hot peas.

No. of Resp.	Score	Time	Response

(1: W) (What suggested?) Might be this...reminds me of a cape blowing out. These points remind me of a sharp hat. (Cape blowing?) Just like when you see them on

[157] very extreme when compared with white American Rorschach protocols. What is
*159 the meaning of this delay? What psychological processes are going on in the
interim? Her subsequent rapid delivery of varied and generally appropriate res-
(125) ponses suggests that she is, in fact, concentrating on the task at hand and
arriving at feasible solutions to the task which the examiner presented to her
("What does this look like to you?"). However, the question remains: why doesn't
she talk during this process?

*(152) One thing we know: she isn't apathetic or disinterested. On the contrary, underlying her delay, there is considerable feeling. Not only does she give four CF responses, but she gives diffuse responses to the blackness and shading elements of the cards. Her first responses to Cards IV, VI, VII, and VIII are vague, whole responses with little, if any, form element involved. Her delay and control do not allow her to succeed in integrating her feelings and impulses with the objective demands of the situation. In R17, for example, we are able to see the manner in which her mental processes may, on occasion, totally ignore the environmental requirements for appropriate behavior. Her response here is "pictures of duck hunters." On inquiry we learn, however, that there are no ducks and no hunters — only fog. Her perception, then, was of a vague, foggy, diffuse world; she enlivened it and peopled it in an elaborate manner through her own rich imagination. To what extent will she allow this rich imagination to overwhelm the demands of the external world? Her Rorschach responses indicate that this will occur often in a sporadic fashion, but that she will be able to recover from these periods and correctly evaluate the situation once again.

This over-ideation, — especially in the light of R26, "men plotting something" — suggests a distinct paranoid trend. She is suspicious of the motives of others and fearful of what the future has in store for her. Even natural forces are considered powerfully threatening; R20, for example, indicates that lightning is "trying to strike" the house.

An analysis of the roles reflected in the human movement responses suggest that this woman has managed to adopt a wide variety of role patterns. She has human movement responses which are verbally aggressive (R26), grasping (R3), guarded (R9), totally immobile (R15), as well as complex (R23). It is this rich, imaginative fantasy life which enables her to delay responding to the blots for such a long time. The reason she must delay is that she does not trust the environment and the people in it.

Some of her movement responses demand more careful analysis. Three of the eight
M are old ladies or witches; witches "are old and mean," she tells us. Since her
very first response to the test is also a "witch," it would be remiss not to try
to determine the personal significance of this response. We are probably on
reasonably safe ground assuming that it reflects her attitudes toward older
women and therefore some kind of mother figure. Her mother could not have been
very nurturing or warm, nor is she likely to see herself as a particularly nur-
turing person; she does not feel comfortable giving emotionally to others. On
the other hand, R3 suggests that she is not content to "do without." If rewards
(158) do not come easily, she is ready to "reach out" for it. At the same time, how-
ever, we must note the content of R15: "two girls sleeping...resting...laying."
Piotrowski has warned of the pathological significance of this kind of immobile
human movement response, suggesting as it does, a willingness to submit to the
external forces without a struggle.

Her animal movement responses are also suggestive of a suspicious and hostile role pattern; of the three FM, the first (R7) is "an animal looking over

Slim: Male, Age 30

Background Data

Slim's case was selected so as to illustrate the situation of a regularly em- 159*
ployed, well liked and respected young male. He is currently employed as a [464]
laborer in a lumber mill, and in the past has worked as a carpenter, and in
heavy industries in the mid-west. He has ten years of formal schooling, obtained [463]
his 12th grade certificate by examination while in military service, and for [871]
one month studied commercial art in Portland. [701]

Slim was born into a large, influential kin group, one which for several genera- [619]
tions has provided much of the tribe's leadership. While his own father has
not been so influential in tribal politics, preferring to work his ranch in-
stead, Slim grew up in association with male relatives noted for their forth-
right independence and leadership, and within a family tradition of progressive-
ness and self-improvement. Slim's early life was spent in alternating periods
of residence with his own father and mother on their ranch, and with his father's [591]
mother in her cabin on the Sycan marsh. This association with "Grandma" was [603]
partly in response to the gradual disintegration of relations between his father
and mother, and partly the result of his father's desire to have "Grandma" teach [593]
him some of the old lore. His mother became increasingly erratic, unpredic-
table, and violent, finally leaving his father. Slim felt badly rejected by [153]•
her and was never able to understnad why she would not accept his efforts to be
helpful. On the other hand, he was very close to his father and his grand-
mother. Today he recalls with satisfaction the many things these two persons
taught him, and dreams recurrently of being in the army, defending the reserva-
tion from attack, and checking in on the old lady to see if she is all right.
This dream is interesting because it expresses succinctly his style of relations
with superiors, for in the dream Slim asks permission of his squad leader to
leave, explains his reasons, then checks in on "Grandma," and returns to his duty.

After the 10th grade was completed, Slim quit school and worked on various ranches.
Early in the Korean war he consciously followed the model of an uncle, who was
a career soldier, and enlisted in the army. His service record was good, marred
only by what Slim feels were two justifiable periods of unauthorized absence,
and he voluntarily served with a combat unit in Korea. This army experience
considerably broadened Slim's horizons, and after his discharge he lived and
worked with an army buddy in the east for a year. Then Slim traveled and worked
in several places in the east and midwest. On two occasions his regular habits [461]
and good capacity for steady work were responsible for a promotion. Characteris-
tically, Slim enjoys this kind of reward, but he does not specifically strive
for advancement.

Slim has many skills, hobbies, and social graces. When young his father taught him to dig ditches, with the advice that this skill would always provide him with a job. He is an expert horseman and stock-keeper, and is a skilled hunter and woodsman who frequently guides his friends on hunting trips. He has learned carpentry, house-painting, and the operation of various industrial machines. More recently, he has turned to archery, sketching, and photography for hobbies to occupy his spare time. Then too, he is an amiable, jolly person who makes good company and who is well regarded as a friend. He is not married, and has never seriously considered marrying. He has had occasional sexual liaisons of a transitory nature, which he finds quite satisfying, and has been "going steady" for several years with an older woman, a person who is a grandmother in her own right.

157 125 the characteristics of the blot been organized intellectually and to what extent is he unable to accomplish this analysis? If he cannot accomplish this, there is a disorder of thinking present. Also, his response to Card II: the whole looks like an island, and the red looks like fire, therefore it looks like "fire on an island." At best it is a fabulized combination; at worst it is a contamination. Only a blatant schizophrenic would have gone to the pathological extreme and said "Fire Island." In addition there are no movement responses, there are only three popular responses and the F plus percent is only 56. Where are the control factors? The sum of color responses is 6; the sum of dark shading responses is 5; and there are not the indications of sufficient controls for this amount of emotional energy.

157 •153 On the other hand, there are a few responses which suggest that his intellectual ability has been greater than average. His knowledge of the word "obsidian," for example, bespeaks this ability,[1] as does the nature, although perhaps not the feasibility, of his "plans." This is not inconsistent with the statements made previously, but it does suggest a situation marked by increasingly greater interference with intellectual functioning.

157 ✗159 The absence of any human responses in his Rorschach suggests his lack of concern with genuine interpersonal relationships; all his talk of future plans and business suggests that he is interested in using people for his own gain rather than in having meaningful and warm interpersonal relationships. His reaction times are quick, supporting the notion that he is likely to act in an impulsive manner. Two of his FM (R2, R7) are "flying," reflecting perhaps his tendency to try to escape from the present situation in an unrealistic manner. His other FM response (R1) may be an indication of his view of human relations: aggressive, cold-blooded, eat or be eaten.

[158] In summary, then, the test reflects an elderly man, whose intellectual and emotional control appear inadequate. One wonders about the possibility of this man having been a chronic alcoholic and now suffering the effects of diffuse organic brain damage. He "talks big" but he probably doesn't "deliver the goods." There are indications that at one time in his life he may have had better than average intellectual ability and now is going downhill.

---

[114] [1] This is, perhaps, the one place in these ten cases where a lack of knowledge concerning Klamath culture led the analyst astray. The Klamath are astride the western volcanic belt and one of the most frequent kinds of materials used in [823] their tool manufacture was obsidian. Hence Sparrow's use of the word reflects his interest in and awareness of an important local raw material.

time, few years have not seen at least one murder upon the reservation. 648* 657* 674

Lesser crimes have also been frequent. Of the 1958 sample of the reservation population above the age of sixteen, no fewer than forty-three per cent had been arrested for misdemeanor, seventeen per cent for felony. Liquor had led to arrest for thirty-seven per cent, and no fewer than forty-nine per cent were judged to have problems associated with drinking. The corresponding figures were slightly higher for those members living in Chiloquin, where opportunity, observation, and arresting officers were all more frequent. 648* 657* 273 [674]

In situations in which other peoples have sought redress in religious movements or covert sorcery, Klamath have more commonly fallen back upon drink and violence. For them the bottle has proven a maladaptive instrument, as shown by a recent survey of the causes of death of 139 members who expired during a period of four and one-half years: drinking was adjudged to be a contributory factor in no fewer than fifty-seven per cent of the deaths.[9] The violence which often caps drinking bouts is likewise self-destructive: for it often strikes close friends or family members. [154] • [165]

From the viewpoint of the city fathers, then, the Klamath have been an unruly segment of the citizenry; and the figures on law and order pose the difficulty confronting the community in the maintenance of an orderly life. Alternatively, however, those same figures represent a sizable income to be realized through the administration of the law. In the latter days of the reservation, as the Indians themselves were clearly aware,[10] the city seemed on the one hand to be profiting from the sale of beer and wine to tribal members and on the other to collect large fines from them when, under the influence of alcohol, they had fallen into the toils of the law. The implications of this policy, by which almost two-thirds of the income of the town was supplied, made many white citizens uneasy. The city fathers, concerned with a parsimonious administration, were not eager to seek a substitute and, indeed, any change would have presented obstacles.

So long as the tribal government remained to articulate their 648* 657* 178 571

121 had been founded. There was, for example, no evidence for anything remotely
181 approximating a "Native Oriented" group on the reservation. Moreover, it became
apparent that a particular style of personal adjustment was by no means
[154] characteristic of the majority of individuals throughout their life-spans.
So called "Transitional" modes of adjustment, for example, might be used to
characterize the confused orientations, the value conflicts, and the disorganized
family life of persons early in their life arc, but the same persons frequently
settled down to a respectable, stable "Elite Acculturated" mode of existence
in middle age. Or this sequence might frequently be reversed.

125 However, the formal sampling approach was jettisoned primarily because of the
many refusals among the samples. That such a reaction might reflect important
123 variables and hence prejudice the reliability of the consequent approach was
considered, but it was apparent that the major cause for refusal was the absence
of an existing friendship relation between subjects and field-worker
(or some influential intermediary). Moreover, an analysis of the status of those
who refused indicated that this reaction was neither confined to nor clustered
within any identifiable grouping.

125 For these reasons, attention was given to securing what may be called a deliberately
representative sample of the reservation population. The criteria of
representativeness included variations in social roles assumed by the subjects
(occupation, sex, leadership, and so on), variations in role performance, differences
[123] in standards and values, and age differences. When appropriate subjects
were known personally by the Anthropologist, they were approached directly.
If no friendship relation existed, potential subjects were, less frequently,
approached through the recommendations and aid of an intermediary, or, finally,
a direct effort was made to become acquainted with a suitable subject. In all
instances, an existing friend relationship proved the more successful mode of
approach. For reasons to be suggested in the next section, there are few Klamath
persons whose influence is both high and extensive, and, conversely, few who
[123] can easily accept external imposition of controls. Thus intermediaries, whatever
their manifest status, rarely could elicit the cooperation of more than one
suitable subject. The result of this effort was a set of Rorschach and Thematic
Apperception Test Records, and short life-histories on a sample of fifty four
persons, which sample could for the purposes of the research be considered as
[128] reasonably representative of the target population. The ten case studies in this
report were selected from the original sample so as to provide as much variety
as possible in the limited confines of these pages.

Aside from the problems of obtaining an adequately representative sample, there
is another aspect of the field method used in the Klamath study which may be of
[123] some interest. In each instance the potential subject was made aware of the intentions
of the field worker and the purposes of testing and interviewing. It
[181] will be clear from the next section that the contemporary Klamath are in no relevant
sense "primitive," nor are they an isolated population. Indeed, many subjects
125 were familiar with the "ink-blot" test from television programs, movies,
177 or hearsay information. More generally, the major task, that of identifying
ambiguous stimuli, was associated with the simple game of "seeing faces in the
clouds" or figures in rock formations. Further, most Klamath under fifty years
of age are sufficiently experienced in the practices of American culture to
have some personal familiarity with the "test situation," whether personality,
aptitude, vocational, or intelligence. Thus there was a shared basis for this
peculiar form of interaction.

159 psychotic symptoms, despite serious emotional disturbance, "because they control,
157 or have reduced, the intensity of their emotional and intellectual processes to such a degree as to produce hardly any specific and easily recognizable schizophrenic symptoms." Their "capacity for energy control (shading) exceeds their capacity for energy output (color)" (Piotrowski & Levine 1959: 223). Thus, having expended all their energy on controlling their behavior and feelings, they are left with little energy for constructive effort and planning (low W).

[171] This pattern may reflect a pathological adjustment in a white American whose culture demands long range planning and constructive effort. In the Klamath
[154] group, however, this emphasis on day-to-day pleasures and consideration for others may be more acceptable than the long range planning and self-aggrandizing behavior which is reportedly becoming the acceptable pattern in American suburbia. If this is true, this subject's adjustment may be perfectly fitted to his environment.

There is, however, additional, independent support for this description of this subject's personality. His preoccupation with the inner details (R2, R4, R24) indicate an approach to life characterized by over-cautiousness —almost suspiciousness — a peering into the situation, rather than an acceptance of it at face value. At the start of the test, he apparently requests clarification of the instructions. The analysis of the movement responses also will support this interpretation.

Despite the verbosity there is actually very little of this man's inner life reflected in this protocol. Rather than reveal himself, the S analyzes the subtle nuances of what is going on around him. He is like the "cat" on Card VIII, "he's watching something...I've no idea (what he's watching)...just watching...". The number of faces and the emphasis on "eyes" (especially the "dark beady eye" on Card IX) are also consistent with the interpretation that we are dealing with a suspicious person — he doesn't trust anyone very far. So all his energy (the little he has) is concentrated on analyzing the possible dangers in any situation, not viewing the situation for all the positive possibilities it offers.

His pace is generally even except for delays to Card IV and VI, the darkest, most ominous of the blots. Is he disorganized by the depressive implications
[154] of these stimuli? If so, we would conclude that he tries to deny the gloomy aspects of life. The sun on Card II is "coming up," not going down and there is a kind of exuberance in his response to Card X. One wonders if he isn't trying to act the part of an optimist, despite occasional qualms about this position.

The only human movement response in the record is R6: "a caricature of two people" and on the inquiry, in response to a question, "I guess they're dancing - jitterbugging I guess you'd call it." The movement was very slow in being verbalized, it was dehumanized (they are caricatures, not real) and it is stereotyped. As such, it probably does not reveal much of this man's conception of his role in
[156] life. Unless perhaps it means that he does not have a well-delineated prototypal role.

The FM, on the other hand, seem to reflect a more consistent image. R10 and R15 (the dog "looking straight at you" and the "watching bobcat") are both scorable as "guarded restraint" responses and indicate that this man's cautiousness, his "watchful waiting" have been past roles and are likely to appear in states of diminished control. He is not guilty or anxious about behaving in this manner.

in the "pink bear" response to Card VIII. However, the abundant formal indications of good adjustment must be kept in mind: the M: FM: m and the FC: CF: C ratios are all in the direction of "good" adjustment (6:4:2 and 3:1:0 respectively). 159* 157

In a record of this richness there are always a few responses which tease the interpreter because they promise so much and yet somehow their meaning remains elusive. Here I note R5 "...a couple of pieces of rope that's starting to burn... looks like the way fire usually flames up...a good start...burning." This is an original and is scored mC. Piotrowski's principle states that the m reflect "prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable..." (Piotrowski 1957: 210). Can the "burning rope" response be interpreted as indicating that the subject feels it would be pleasant and desirable to "burn up"? Is she using "burn up" in the colloquial sense of experiencing fully and completely a feeling of anger? It would be consistent with our previous statements about her aggressive needs which are not being expressed. She would like to let herself get "burned up" at somebody, but she does not allow herself to.

We have a record, then, of an intelligent young lady who is utilizing her intellect and energy to deal with underlying feelings of tension and aggressiveness. Her major mechanisms appear to be the use of fantasy and intellectualization. She is often tense and anxious, but she is able to deal with these feelings in an appropriate manner. [154]

Sparrow: Male, Age 63

Background Data

*159
[156] Sparrow's case is cited because of his position on the lowest rung of the local
status hierarchy. He is known as a happy-go-lucky, worthless old drunk and is
generally considered as "lacking a few of his marbles." However, Sparrow is
[872] seldom publicly disparaged, for local citizens simply pay little attention to
[464] him. He has a sixth grade education, gained at the Agency school. He has
apparently never worked consistently at any job, and most of his work experience
[434] has been as a farm or ranch laborer. He is and has for years been totally dependent upon per capita income and the income from ranch lands owned by his mother,
with whom he lives. Their affairs are managed by a local businessman who some
years ago was appointed their guardian. He is the second eldest of four siblings.
After his father's death forty years ago, his mother remarried and bore two other
[586] children. He was married once when a young man, and after four years divorced
his wife because of "her shiftless ways." He is a semi-invalid, the result of
[164] an accident years ago when a drunken brother drove over him with a truck, crushing
[191] his pelvis. He speaks fluent Klamath, the result of constant association with
his aged mother who represents a direct link with the aboriginal Klamath past,
as well as adequate English, learned in school.

[733] Much of Sparrow's time is spent in jail for drunkenness, in the local tavern,
with one of the drinking cliques, or passed out in a doorway. When he is not
totally drunk he spends much of his time with his mother, for whom he cares in
his fashion. Occasionally he goes fishing in a nearby river. For at least
twenty five years, this has been the pattern of his activities.

*159 Sparrow has many skills, among the most striking of which is the ability to
"fly from here to the Agency without once touching the ground." There are
● 154 several dimensions to this delusion, one of which is an association, in Sparrow's
thinking, with the acquisition of power. When a young man he dreamed of acquiring the power to "rise up off the ground, like Jesus Christ." While such
a belief may have aboriginal correlates, there are no Klamath today who would
accept it as valid. Sparrow keeps this secret to himself, and relates it only
to strangers and transients from whom he intends to borrow money. His other
skills include the following: the ability to keep house and cook, harness making,
leather working, painting, canning food (the notion involves laying in stores
for the winter), tanning buckskin, wood carving, carpentry, poetry composition
(in Klamath), arrowhead making, making traditional basketry, stock raising,
restaurant management, and finally, the ability to bewitch rich old white ladies,
who are captivated by him and who drive him about in their white Cadillacs. The
latter may be associated with a recurrent dream of meeting with a white buffalo,
also a symbol of power, but it is difficult to say, for there were never any
buffalo near the Klamath, and it is more likely that he has got this idea from
reading western stories. Needless to say, most of these skills are quite delusional also. There is no evidence for any of them being more than this. Relating one or more of these is Sparrow's single style of interacting with others,
for in reaction to a question or another's anecdote he will sift about in his
memory until he comes up with one of his capacities which seems relevant. Very
frequently, the writer could not see where or how they were appropriate, but for
Sparrow there seemed to be some connection. He relates these matter of factly,
with only the most slight suggestion that they were self-enhancing, and no indication that he meant to justify himself, and will then coyly watch his listener
to see if he is properly impressed. This behavior tends to merge with Sparrow's

7

extensive plans for the future (e.g., opening a second-hand store and capitalizing on the poor buying habits of the "Indians.") none of which have much chance for materializing, but many displaying a fairly shrewd assessment of the local community. He can get quite enamoured with making these plans, and savors the profits in his current fantasy. 159* 154•

Sparrow was tested while in jail, this being the only likely time when he would be sober enough to see the blots clearly. 159* 124

Rorschach Interpretation

In reading this Rorschach protocol, one gets the impression of a gregarious, effervescent, kindly, but ineffectual elderly man. He lives in the past and the future, but not in the present. He probably is unable to deal with the mundane issues of his present reality situation so he concentrates on his past experiences or his future plans. This characteristic trait is reflected in the de-emphasis of D responses and his over-emphasis on vague and undifferentiated whole responses. 159* 157 [154]●

His emotional effervescence is reflected in the low F% (20%) and high Sum/C (6). His responses to the test tend to be largely of an emotional nature: shading, color, movement; they are not based on a cold intellectual, rational analysis of the blots. And so his life adjustment would be of this nature, i.e., determined largely by his feelings at any one moment.

One must consider seriously the possibility that this lack of intellectual control bespeaks of a serious psychological disorder --whether it be of an organic or functional nature. Is his response to Card IX a contamination, for example, "it's the shape of Australia and the green suggests grass. It's the color of an island." What is meant by the "color" of an island? To what extent have 157 125

something," the second (R16) is "a big vulture," the third (R22) is a "cougar 157
stepping lightly." All suggest the general attitude of caution and care which 159*
the subject seems to feel is necessary to avoid dangerous situations.

The comparison of M and FM responses suggests that the subject now enjoys a wider repertoire of roles than she had in the past. No one of her M's, however, is a healthy assertive one; each has its own particular idiosyncratic sign of the subject's inhibition, hostility and suspicion.

One particularly puzzling aspect of her Rorschach summary is the Sum/c:Sum/c' ratio. Piotrowski writes that usually a person gives either light shading or dark shading exclusively. When both are given in substantial quantity, he feels we are dealing with a pathological adjustment. His reasoning appears to be based on his notion that the c reflect a flight response to anxiety, while the c' represent a fight response — clearly incompatible. The present subject appears, indeed, to be torn between these two patterns of adjustment and her behavior is likely to alternate between them. Her actual response to the blots, of long delay followed by "spitting out" the responses, may be a case in point.

This young woman is, then, relying mainly on an extensive fantasy life to cope [154]
with pervasive and powerful pressures both from within herself and from the
environment. Despite a tendency to behave in a diffuse, over-emotional, and
poorly controlled manner at times, she seems by and large to be effecting an
adequate adjustment. Intermittent depressive moods, perhaps temper tantrums on
occasion, punctuate a volatile adjustment.

Rorschach Interpretation

157 *159 [125] The Rorschach test reflects a person who has managed a satisfactory adjustment largely through the inhibition of whatever originality and creativity he might have possessed. The extremely high a%, the limited range of content, the six populars and the absence of any original responses point to the stereotyped conventionality of this man's psychological process. This apparent dullness is not due, however, to a lack of capacity. His vocabulary, the presence of movement responses, and the occasional well organized whole response indicate that he has the potential to do more with his life than he now settles for.

The effects of this marked inhibition are numerous. Firstly, the extremely long initial reaction times, averaging close to a minute, are indicative of the blocking and caution which marks the record as a whole. Secondly, the color denial in R18 point to the hesitancy with which he approaches emotional situations. Thirdly, the nature of the human movement responses reflect internal conflict, tension, and blocking. The first M in the record (R4) highlights this man's feeling that he is hampered when he tries to express himself. He is not sure whether people can work together or whether efforts at cooperation end in conflict. But even if they work together, people must work extremely hard and are not likely to accomplish very much. This is not to say that this man has not accomplished much in actuality; on the contrary, he probably does work hard and may have substantial achievements to his credit. But, psychologically, he is blocked and wastes much energy in this internal struggle. [56]

The other human movement response (R12) is also not an assertive one; although it is not as blocked as R4, it is a restrained response — probably best classified as "guarded restraint." It does not contradict the interpretation made on the basis of R4. It adds several interesting facets, however. First is the exhibitionistic element; this man needs to be admired. Secondly, both his M's are female — attention is given to the breast in one and to the "big butt" in the other. This preoccupation bespeaks some conflict in his sexual role, which may be one of the dynamic factors in his general inhibition.

•[154] A final Rorschach indication of inhibition is the ambiequal experience balance (2:2.5), which according to Rorschach's original monograph points to an obsessive-compulsive adjustment. This man spends time and energy worrying about his psychological conflicts and possibly even about abstract or philosophical issues. For instance, during the inquiry of Card II, he asks, "What's the difference between form and shape?" Although he may merely be expressing some resentment toward the examiner and the inkblots, the other indications of obsessiveness, suggest that this question may be part of an overall pattern of doubting and indecision.

Although many of the FM are also guarded restraint movements, there is one that deserves special attention: "two birds falling to the ground...probably shot." This reflects a role concept in which the subject feels at the mercy of external forces; this would be much more disturbing if it had occurred in an M response. Appearing as it does in an animal movement, it suggests a role which he may experience in states of diminished consciousness or may have lived through in the past. It is clearly a role more appropriate under these circumstances. Is there any significance to the fact that this response follows the very blocked M ("two men trying to lift something")? Does the subject feel that if he makes too great an effort, he will "use up" all his energy and become helpless?

159
157 There are no indications of peculiar thinking or intellectual impairment, but the total absence of color responses does reflect a poverty of emotional responsiveness. She appears to be a laconic, taciturn youngster. Her free associations are stated briefly and not spontaneously elaborated.

157 156 The Rorschach gives us, then, the picture of a stereotyped, overly conventional adjustment. She is a "good" girl who does what she is told and uses her fantasy to gain the little instinctual gratification she gets. [154] The fact that her smile comes as she is describing "teenagers dancing" suggests that, like most youngsters her age, peer relationships are particularly important to her and that this is not an area of particular threat. It is probably the male authority figure who is her difficulty.

*159
156 177 This protocol contains the first overt comment concerning an acculturation process. One can perceive her distance from her father in her discussion of R10; "...it's supposed to get whoever they sing for well." Her objectivity here indicates that she is a part of the generation which is undergoing acculturation. She can apparently look, with distance, at her father's tribe's customs. [121] One wonders to what extent this cultural change is a factor in her difficult relations with her father, or whether — with Freud — it's the "universal Oedipus complex" we see here.

This is a conventional record to the point of constriction; 5 or 6P; F plus percent adequate; several M; no major shocks. Only the absence of color responses stands out. We are left with the question of how and why this youngster has [121] buried her feelings so completely? Although this is a brief record, we hazard the guess that it is the stress of acculturation which has created the overcontrol which characterizes this girl's adjustment (R10).

a weak differentiation of parental roles and the extension of 648*
surrogacy to grandparents or other kinsmen. In many instances, 657*
the father was either absent or aloof, and the chief burden of 592
child rearing fell upon the mother, who might shift it for several 593
hours or longer upon the slender shoulders of an older child. Among such families, parents often proved unpredictable, their excesses of affection and indulgence alternating with fits of anger, depression, and withdrawal. Rather than being consistently directed toward a program of training, parental behavior tended to be a response to a mood or an isolated element in the immediate situation. Even the admonitions of the elders, the traditional set speeches enjoining ideal behavior, frequently were made without reference to the immediate conduct of the child.

In children, this experience tended to generate a defensive 648*
isolation, a dependent craving which anticipated rebuff, and a 657*
marked hypersensitivity toward others concealed beneath an 592
outward manner of stoic indifference. One probable outcome 593
of childhood exposure such as this was the "guarded restraint" 155
which Clifton discerns as a marked characteristic of Klamath personality, an attribute which, it appears, lessens in severity only in old age.[3]

If there were few fixed and dependable social relationships 648*
in many Klamath families, there likewise was little predictability 657*
in daily routine. As Pierce notes, meals were rarely served at 592
fixed times or attended by the entire family. Instead, individuals 593
ate when hungry. Children rarely had regular chores or bedtime.[4] [264] [857]

It was in the training of children to become functioning mem- 648*
bers of society that the tribal families faced a central test of their 657*
effectiveness. Although it was not clear to what segment of that 592
society the children were to aspire, their elders were in agree- 593
ment in wishing well for them. Tribal orators, challenged upon 858
their personal aims, could disavow self-interest and strike a resonant chord by asserting that they were acting only for the good of their grandchildren. Adults, however dissatisfied they might be with their own achievement, might still hope to see a transcendent future for their sons and daughters. In the school, with its promise of equal opportunity to advance through merit, American society held out the means to implement that hope.

All too frequently, however, childhood experience in the 000

All too
*648 frequently, however, childhood experience in the
*657 event-centered activities of Klamath households, with their
871 diffusely focused social expectations, clashed with school routine.
563 For many young Klamath, coming from such a background,
(155) exposure to a clear-cut, hierarchial system which they entered
(592) from the bottom and to a sustained discipline proved stressful. The conflict between family subculture and that represented by the middle-class teachers, felt as well by white children, was experienced more sharply by the Klamath, not alone because the disparity was often objectively greater in their case, but because it came to be invested with ethnic judgments.

That tribal parents differed from white parents in educational background and intellectual interests is evident; and the differences upon the reservation have tended to persist despite the fact that the Klamath have long been subjected, like whites, to compulsory education and that since 1926 they have attended county schools. A comparison of a small sample of tribal members in Chiloquin with other segments of the population revealed that no fewer than fifty-two per cent of Tribal house heads and thirty-nine per cent of Interethnic house heads had stopped their education at grade school. For white house heads, the corresponding figure was only twenty-two per cent.[5] In the use of the public library, a branch of the county system lodged in Chiloquin's city hall, the figures for adults show white, Interethnic, and Indian users far outstripping the Tribal; and while among the children Interethnic users fell close to the Tribal figure, the latter still lagged behind all others. With a few individual exceptions, data on the periodicals taken in the home and attendance at concerts in Klamath Falls showed a corresponding gap.

*648 Thus the school experience marked a grave discontinuity in
*657 the life of many tribal families, and particularly among those
871 in which both parents were Klamath. The stresses mounted,
155 however, in the transitional years of junior high school, during the seventh and eighth grades. The reasons are not far to seek. The schools, viewed by whites, Indians, and a minority of tribal members as an objective preparation for a life in which the demands for training were ever mounting, offered little incentive to children who were convinced that a ceaseless flow of per capita dividends gave them an assured income for life. Klamath parents

648* 657* 871 155 •

often seemed to take the school for granted as just another of the rights granted them in the treaty of 1864.

648* 657* 871 563

For their part, whites often ignored the contributions made either on behalf of the Klamath or directly by them toward school support. Tribal parents tended to see in the school bureaucracy another manifestation of white surrogacy. Even at the time when an Indian—a non-Klamath employed at the Agency—was elected to the presidency of the PTA, the large majority of tribal members declined to join that body. On other occasions, students elected a tribal member and an Indian president of the senior class. Notwithstanding, issues which arose from time to time convinced some Klamath parents that the schools were racially biased. Although restive, they confined themselves to individual action, in angry criticism, occasional arguments with teachers, and rarely in assaults upon a teacher or principal.

648* 657* 87 563

In the Chiloquin grade school, most of the teachers were the wives of local men, having a comparatively long residence in the area and a familiarity with local conditions. At that level, the curriculum was largely undifferentiated and a policy of social promotion was followed. Consequently, the grade school offered conditions for a smoother adjustment than did the secondary school. Even so, truancy was more substantial among tribal children than white, and the imposition of discipline, often interpreted by indignant Klamath mothers as an expression of prejudice, was hedged with difficulties.

It was in the junior high school that the frictions rapidly mounted. Here, and increasingly in the high school, the modest educational assets—the two schools in 1950-51 had a combined staff of nine teachers—were strained by contending demands for both vocational training and a college-preparatory curriculum. With subject specialization, a professionally oriented teaching staff, composed primarily of men who had been hired from outside the area, dominated the school. Individually, they tended to be less permissive toward their students than their fellow teachers in the grade school. Promotion in high school was upon merit. Meanwhile, as students attained puberty, they came to be increasingly aware of the significance attached by their elders to racial differences. Disciplinary problems now mounted, and so did dropouts. The truancy rate (1956-57) for white children

Individuated family relationships and the instability of the marriage tie have 593
other ramifications. Parental care-taking activities are minimal and are some- 855
times non-existent. Given the pattern of drinking and partying, children are
frequently abandoned to the care of a hired baby-sitter for days at a time, [581]
or to an older relative, or to an elder sibling. If the party occurs in the [181]
household, children may temporarily be moved elsewhere, or they may simply be
left to shift for themselves. Thus at crucial developmental stages children may [603]
find their identification with parents broken by alternating periods of presence
and absence, and their affections given over to an older sister (the picture of [155]•
the determined little twelve or thirteen year old "child-nurse" is a clear one)
or to a grandmother. When parents are present, Klamath children are usually
faced not only with minimal care and attention, but with indifference and aloof-
ness. The father especially is dissociated from significant relationships, and
both he and the mother are frequently given to unpredictable and alternating
fits of love and anger. Thus within the nuclear family, there is little ex- [155]
perience with consistency in role relationships.

Thus the first years of life are spent by the Klamath child in a loosely bonded, [602]
amorphous household group, and he has some lesser, but important ties to other
kin. At age six the Klamath child attends a local public school. Reflecting 872
the incohesiveness of the family group, these children are accustomed to lax, 861
permissive controls of their behavior, and are not accustomed to confronting clear-
cut, specific, over-riding standards of conduct. At the same time they are not [593]
accustomed to maneuvering opposite a single, stable authority figure. Yet [181]
these children are characterized also by a dependent craving for affection and
attention which does, initially, facilitate adjustment to the school milieu. [155]
In contrast, they frequently anticipate rebuff. In later years the latter seems to
be the stronger inter-personal need, and the growing child becomes increasingly [156]
characterized by a kind of defensive isolation from close personal contacts.
This may be adequate training for participation in contemporary Klamath culture,
but it hampers and restricts adaptation to the larger society.

In many respects the values and skills learned within the household to not ade- 155
quately prepare the child even for school adjustment, with the requirement of 156
regularity and time-mindedness. Similarly, the daily routine within the house-
hold may be such as to impede the child's getting to school on time, or it may [871]
throw the responsibility for attendance on very young children, or it may get
him there unfed and, by school standards, improperly clothed. At the same time
the child may have had recited for him, or he has surely overheard recounted,
the myth of Klamath racial inferiority. Too frequently this belief in in-
feriority is assimilated as a segment of the growing child's self system, con-
tributing in turn to his acceptance of poor performance, to a bitter rebellious-
ness, or to a destructive pride. The same experience reinforces the expectation
of rebuff, if this time somewhat more consciously. In fact, in later school [563]
years the Klamath adolescent does meet with informal racial barriers in the [582]
areas of courtship and dating, for the path to inter-marriage with local Whites
is not an easy one.

It is at this juncture, in early adolescence, that parental controls of the child 882
are almost totally relinquished. Made thus culturally independent, the child 156
may then enter high school and find that for the first time he has to compete
with his peers, for there are few social promotions in high school. Because he 155
is fully aware of his economic independence, and because of the other factors
cited, the pattern is for Klamath children then to find themselves propelled into
an adult status. The associated school phenomena at this juncture is a high [871]

882
155 drop out rate of Klamath adolescents, a slacking of attention, and a decline
156 in test performance and grades.

871 Something of the character of adult Klamath concerns and behaviors has already
156 been suggested. Many work in only a desultory, disinterested fashion, and it
is unusual for a Klamath woman to have a full-time job. Thus self-concepts are
[461] not so closely bound to job or profession as are those of local Whites. In
1953, for example, it was found that 65% of adult Klamath were wholly or partly
434 dependent upon per capita payments for their livelihood. Whereas the reluctance
of Klamath women to take outside work reflects the pressures on them to remain
[462] in the home and the extent of their responsibilities there, it also reflects
the fairly secure economic position resulting from the special benefits of
tribal membership. Aside from the twice-yearly per capita payments, these benefits include the privilege of year round hunting and fishing, medical care, loan
services, tax exemptions on land and privileged employment rights at the Agency.
[464] On the other side of the coin, outside of the Agency, the principal local employers are Whites, and for one reason or another they are very reluctant to hire
tribal members. In historical perspective, the development of tribal income paid
out in the form of per capita payments has paralleled the decline of Klamath
participation in the labor market. The contemporary Klamath do not work so often
nor do they work so steadily as did their parents and grandparents. There are
fewer Klamath loggers now than there were in the past, almost no business men now,
and fewer active ranchers and farmers.

434 In spite of shifting policies and personnel, the influence of the Klamath Agency
657 officials has been one of constant supervision over and intervention into the
affairs of Klamath individuals and groups. The controls over the expenditures
of children's funds was noted, and the same controls are exercised with respect
[241] to those tribal members who have been deemed incompetent. Yet the activities
of stable ranchers and farmers have also been supervised by extension workers,
[654] and efficient, prospering Klamath farmers complain that, with a good price decided
on and a buyer waiting, they have to await the approval of an extension worker.
Thus the adequacy of Klamath individuals is frequently in doubt, whether by experience with a particular tribal member's high style of living, or by policy.
657 At the same time in many ways the Klamath have been protected from responsibility
for their own actions. Payment for debts incurred with local merchants is an
426 example, for the reservation being under federal jurisdiction, goods unpaid for
could not be repossessed, nor could income be garnisheed. As Stern and Swanson
phrase this situation, the Klamath have attained economic security "attended
by supervision."

657 Of course, through constant experience with Agency personnel and policy the
829 Klamath have learned that bureaucratic restrictions may be evaded or circumvented, and they have long since acquired knowledge of the appropriate manner
of phrasing a request for funds or services. The Klamath complain of this that
forced contact with the Agency has made liars out of them.

648 In summary, little more than a century of contact has merged the originally
177 distinct Klamath, Modoc, and Paiute, and has altered them physically, culturally,
171 and personally. In spite of a small assimilated minority and a large off-reservation population, the reservation Klamath exhibit a distinct way of life
657 which is novel if heterogeneous. This Klamath Reservation Culture is the
familiar context of everyday experience for contemporary tribal members. Thus
181 it is the source of what stability and security they know. No matter how variant,
or how disorganized this pattern of life may be, it is one whose outlines are
the consequence of the thousands of daily decisions, the many lines of action,

Susan: Female, Age 24

Background Data

156 Unlike Slim, Susan is not so well liked or respected. The occasion for this is
*159 specific, an unsanctioned pregnancy during her last year in high school and a
[848] more recent marriage to an entirely disreputable Mexican from Utah. This community
evaluation is accentuated because of the very high respect in which her
[582] own family is held. Everyone expected better of Susan.

[626] Susan has worked as a dishwasher in several cafeterias, both on and off the
*159 reservation, and moved to Utah so as to take a practical nursing course. She
found this training uncongenial, met and married her husband, and they returned
[464] to the reservation when his small business failed. Susan is a high school graduate.

[874] Susan's mode of selecting a husband parallels that of her mother, who met her
husband while hospitalized in New Mexico. Her father by birth is an Apache
*159 Indian, and by cultural affiliation a southwestern United States Spanish-American.
593 Without doubt, he is the most autocratic, stern, demanding, rigid adult male on
the reservation. Although a married woman with children of her own, Susan must
ask her father's permission to use the telephone or to walk downtown. Her mother
was Klamath and very well respected for her stable family life and for her active
participation in many community activities. Susan was extremely close to her
mother until her unexpected death several years ago. They were known as an inseparable
pair and her mother never went out of the house without her. The
mother's death was, perhaps, the major cause of Susan's failure to complete her
nurse's training. Susan's illegitimate pregnancy in high school was a considerable
shock to her mother and is, with her marriage, a continuing source of strain
•[155] with her father. Susan evidently feels that her behavior was a contributing
cause for her mother's death. She made a death-bed promise to her mother that
she would not be a loose girl and that she would marry and stay married to one
man. It was shortly thereafter that she married and returned to the reservation
to live with her father. There is much strain within this household, derived
from the relations between father and son-in-law, and from Susan's unsuccessful
efforts to serve two masters, for along with her marital relationship she evidently
[626] was trying to act as a replacement for her deceased mother's role. At the
same time her conduct has alienated her from the church, from family friends,
and from the community.

*159 The contact with Susan was made via her father, who told her that she should
[124] cooperate. Her father's motivation in this was not, as may be supposed, the conviction
that she needed testing because something was wrong with her, but involved
[123] a more general sentiment. He felt somewhat honored to have an "educated
man" visit his house and that such a contact was a good experience for his children.
[593] Susan accepted this like an obedient, dutiful daughter. She came readily,
with no indication of unwillingness, and relations with her were quite good,
perhaps because of the strains of her marginal position and her need to talk
with someone.

*159 Susan seemed an apathetic person whose feelings were dulled. If anything, her
reactions were those of an over-trained, too obedient child. She was not very
157 responsive or active, and would seldom talk except to answer a direct question.
Then she would, frequently with evident pain and anxiety, describe her feelings
and situations tersely and haltingly. Susan clearly wants more than her life
now gives her, but cannot define her present conflicts or see her way clear to

Rorschach Interpretation

157 *159 [125] The Rorschach test reflects a person who has managed a satisfactory adjustment largely through the inhibition of whatever originality and creativity he might have possessed. The extremely high a%, the limited range of content, the six populars and the absence of any original responses point to the stereotyped conventionality of this man's psychological process. This apparent dullness is not due, however, to a lack of capacity. His vocabulary, the presence of movement responses, and the occasional well organized whole response indicate that he has the potential to do more with his life than he now settles for.

The effects of this marked inhibition are numerous. Firstly, the extremely long initial reaction times, averaging close to a minute, are indicative of the blocking and caution which marks the record as a whole. Secondly, the color denial in R18 point to the hesitancy with which he approaches emotional situations. Thirdly, the nature of the human movement responses reflect internal conflict, tension, and blocking. The first M in the record (R4) highlights this man's feeling that he is hampered when he tries to express himself. He is not sure whether people can work together or whether efforts at cooperation end in conflict, But even if they work together, people must work extremely hard and are not likely to accomplish very much. This is not to say that this man has not accomplished much in actuality; on the contrary, he probably does work hard and may have substantial achievements to his credit. But, psychologically, he is blocked and wastes much energy in this internal struggle. [155]

The other human movement response (R12) is also not an assertive one; although it is not as blocked as R4, it is a restrained response — probably best classified as "guarded restraint." It does not contradict the interpretation made on the basis of R4. It adds several interesting facets, however. First is the exhibitionistic element; this man needs to be admired. Secondly, both his M's are female — attention is given to the breast in one and to the "big butt" in the other. This preoccupation bespeaks some conflict in his sexual role, which may be one of the dynamic factors in his general inhibition.

[154] A final Rorschach indication of inhibition is the ambiequal experience balance (2:2.5), which according to Rorschach's original monograph points to an obsessive-compulsive adjustment. This man spends time and energy worrying about his psychological conflicts and possibly even about abstract or philosophical issues. For instance, during the inquiry of Card II, he asks, "What's the difference between form and shape?" Although he may merely be expressing some resentment toward the examiner and the inkblots, the other indications of obsessiveness, suggest that this question may be part of an overall pattern of doubting and indecision.

Although many of the FM are also guarded restraint movements, there is one that deserves special attention: "two birds falling to the ground...probably shot." This reflects a role concept in which the subject feels at the mercy of external forces; this would be much more disturbing if it had occurred in an M response. Appearing as it does in an animal movement, it suggests a role which he may experience in states of diminished consciousness or may have lived through in the past. It is clearly a role more appropriate under these circumstances. Is there any significance to the fact that this response follows the very blocked M ("two men trying to lift something")? Does the subject feel that if he makes too great an effort, he will "use up" all his energy and become helpless?

157 "girls tied together by hair," and "guys on cliff handing something to one
*159 another." The "cannibal" and "punished girls" responses are certainly aggressive enough, but what of the cooperation implied in the "guys on a cliff" response? The "men dressed as bears" and the "puppet show" are playful, assertive and free, while the "fan dancer" reflects that extra gaiety of which the subject herself seems somewhat abashed (she "breaks out in laughter"). These are all human movement responses and thus the subject is capable of experiencing
[155] all the diverse rôles reflected. In a person with fewer other resources this might lead to unbearable conflicts, but in this woman there seem to be the strengths which make it possible for her generally to utilize this flexibility, despite the conflict. These additional resources are reflected in the use of color and shading (dark and light).

Her color responses are generally adequate and of a positive kind — although somewhat shallow. The presence of many responses to the black and white are interpreted by Oberholzer (1944) as further evidence of shallow, lazy affect. Thus, she probably does not get too deeply involved with people. She can get along with others moderately well, but she really does not need them.

[126] The presence of six popular responses and an F plus % above 80 are sufficient indication of her ability to attend to conventional aspects of the environment in a realistic manner, despite her tendency to experience her emotions.

[156] Nonetheless, there is the hesitancy in interpersonal relations which we have seen in most of the Klamath records. Here it is reflected in the disguise needed by the figures on Card II and the several aggressive M and FM responses. And she is still pretty unsure that the recent developments in her life are desirable; perhaps the old method of punishment was the best (R29). Probably the essential conflict in roles described above are the keynote of this woman's adjustment. Shall she "eat the carcass" or "lend a helping hand?" Shall she be a "fan dancer" or is any transgression punishable? The comments during the testing are both joking and veiled hostility: "Are you naturally pigeon-toed or do you just sit that way?"

But despite the richness of the record, the woman behind the record remains elusive. Could it be that her enormous flexibility in role taking has made it difficult for her to carry through one integrated life style to the extent which is necessary to call it her own? The Rorschach suggests that this may be the case. However, it is clear that her overall adjustment is a satisfactory one — perhaps eminently so.

are marked by alternate periods of (brooding?) silence and she is more than a 159*
little pretentious, as for example her response to TAT card #1, "Oh, that's 157
that famous European violinist...Levi Strauss." Her life has been characterized [156]
by many extremely stressful situations, but she does not seem easily discouraged,
and maintains her vigor and independence. She tends to over justify herself, as [155]•
if she had some doubt about certain of her characteristics, or as if she had
strong feelings of uncertainty or inadequacy. This is in strong contrast to her [156]
leadership role in her family, and her domination of many social situations. She
is also somewhat excitable and tends to directly express her emotions more than
many other Klamath.

The working relationship with Grandma was one of the best. When she first 159*
learned the writer was an Anthropologist she warmed to him immediately and 124
volunteered to take the tests. She was tested "on the job," at the top of a [123]
200 foot fire lookout tower in the midst of the Klamath forest.

125 128 [157] [124] response provided some of the first clues as regards this important personality attribute (Clifton 1960). But other test evidence, as well as life history and observational data, leads to the same conclusion, regardless of the presence or absence of a restrained movement response.

157 156 [125] One facet of Klamath guardedness and restraint is the general reluctance of Klamath individuals to reveal or communicate to others their needs, wishes, interests, or concerns. This may, in part, be seen as a function of suspicion, of fearful concern with the possible reactions of others, but another characteristic of Klamath persons may be associated with this reserve. The reference here is to a general, overt, and conscious devaluation of the self. The Klamath seldom have much good and often much that is bad to say of themselves. Although this characteristic is not directly manifested in the Rorschach records, these records do indicate the presence of multiple and conflicting, or unacceptable prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 156 155 657 [171] [158] The analysis so far points to a general isolation of Klamath individuals from significant, durable human associations. Given the facts of Klamath reservation culture we consider that this characteristic is probably adaptive, although it might not seem so if measured against an ideal model of mental health based upon the functioning of west European, urban, middle-class persons. Considering the realities of the Klamath situation, guarded restraint in itself may hardly be considered as pathological. Yet so great a reserve and so extensive an insulation of the self from important human transactions may be a major source of stress and may predispose Klamath individuals to variant forms of mental illnesses.

157 158 [121] Several of the cases contained in this report provide evidence for this hypothesis. In the instance of Slim, for example, we find that a superficially adequate adjustment may simply be the manifestation of an obsessive control over and reduction of emotional and intellectual processes to the point of a tentative diagnosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 127 The validity of this assessment does not depend upon these ten case studies alone. Very similar if more limited conclusions were obtained in a previous, independent

[Klamath Reservation]

K In such a sphere, and in relations with strangers beyond, the
M myths picture encounters fraught with possible danger. They
609 may be initiated by a trucial period which endures until, by
proper guest-host behavior, by a claim of kinship or on the other
hand by an act of aggression, the issue of "friend or foe" is
K precipitated. Hospitality dictates that one receive and feed the
M stranger, though a visiting kinsman brings a gift of food or
[574] otherwise repays the kindness. If, however, hostility is decided
upon, it rarely becomes open: instead, both sides proceed indirectly, under the guise of amicability, and employ followers or auxiliaries to encompass the destruction of the other. It is here that the prescient qualities of the hero, his access to assistants and to supernatural forces, are decisive.[19]

K In ethnographic reality, the outer limits of society are marked
648 by the boundaries of common speech. Beyond this, the Klamath maintain amity with the Molala, intermittent friendship and hostility toward the Warm Springs and other Columbia River Sahaptin, who sometimes raid them, and toward the Paiute; inveterate hostility toward the Takelma of the upper Rogue and other peoples west of the Cascades; and a predatory aggressiveness toward the Pit River and Shasta to the south, whom they increasingly raid for slaves and loot.

K The horizons of such a society are not wide. With the ex-
M ception of the shaman, a part-time specialist, each man and each
571 woman has much the same skills and knowledge as his fellows.
• 156 The aberrant individual can do no more than assume the dress
[838] and behavior of the other sex, ascribing his action to supernatural
dictate. The transient forms of the community and the informal constraint it imposes, the paucity of activities that demand concerted action, go hand in hand with a permissiveness in the individual. When this takes aggressive form, it may threaten the very fabric of society.

K The covert expression of hostility is likely to invest relations
M beyond the natal family with fear and mistrust. Revenge can
754 take the form of murder from ambush, sorcery to engender the
571 illness or death of the enemy, or the stealthy destruction of his
152 property.[20] One frequent cause of open slayings, and of the feuds
682 that ensue, is suspicion that a shaman has brought about the
death of one's kinsman. Commonly, such charges are leveled

648*
of tribal members held aloof, while some members were no more 657*
than "Sunday" or "holiday" Shakers, attending services only at 795
wide intervals. 177

That there was no single Klamath response to culture contact 648*
even upon the reservation, must now be abundantly clear. It is 657*
also true that tribal members are not to be found extended along 184
a single continuum of change. No typology satisfactorily pre- 177
serves the mosaiclike pattern of the accommodation they have 178
made. For the course, even of institutional change, is the product, not of the engagement of reified "cultures," but of the countless individual choices expressed before concrete alternatives and projected against past experience. In the successive role-relationships into which they have entered, the biographies of some elderly Klamath suggest that there may well have been for them an inner continuity, not unchanging, which provided in their life-way a reference and a means of self-identification.[15] For many younger tribal members, however, the range of possible identification has become greater, while coercive restraints have weakened; and their selection among behaviors may be so conditioned by factors in the immediate situation as to appear inconsistent from one time to the next. Cultural confusion may well have resulted in their failure to form a stable self-image.

A central characteristic of modern Klamath relationships has 648*
been termed, for want of a happier phrase, "permissive diver- 657*
sity."[16] By this is meant a condition offering the individual a wide 156
latitude of choice among multiple and optional alternatives, per- 177
mitted modes being not only broad in range but diffusely de- 178
limited. Analyses of Klamath myths[17] and of the ethnological record suggest that this state, which corresponds in large measure to the "loose structuring" of Embree,[18] was characteristic of aboriginal Klamath culture, but it may well have been enhanced in reservation times by the breakdown of native agencies of control and by those other developments fostering individualism. The roots of its continuity lie in conditions of child-rearing, already reviewed, as well as in the social transactions of adult life.

The corresponding qualities in the individual are equally clear. For many Klamath, the interpersonal distance is of considerable magnitude, and constitutes a wary, defensive response to the

*648 anticipation of rebuff. It may have as its corollary a diffuse self-
*657 image, since the subject lacks any consistent delineation of his
• 156 characteristics from the reactions of his fellows. For some, as
177 well, there is a sense that a stable reference to self through time
178 is lacking, since each fresh experience tends to define it anew.
For the majority of tribal members observed over a period of time, enduring reference groups in which one could claim membership were limited to such entities as "Klamath Indian." As Clifton has put it:

> Persons as psychologically isolated as the Klamath must work hard at the business of maintaining their position. They cannot be expected to contribute much in the way of specific demands on others (outside of occasional impulsive outbursts), and they value situations where specific demands are not made on them. We seem to be confronted with a human group whose members share a primary orientation toward living which is organized around the need to be left alone to their own devices as individuals.[*]

Permissive diversity has found an expression in the manner in which individuals have fused life-ways out of historically disparate elements. This was particularly striking among the older Klamath, who in their youth had participated actively in traditional Klamath culture. Some, indeed, pointed to the essential similarity of native ethic and of Christianity; but others found no need to justify their choice. Life for them possessed a meaning that was involved less in the cultural source of its elements than in the condition of their combination.

*648 One old friend, then bedridden and since deceased, may serve
*657 to illustrate the point. As a child she had lived in an earth-lodge
159 and witnessed her uncle, the shaman, Alec Wilson, performing
177 his cures. Later, as a young woman, she became ill when dream-
178 ing of a shaman, and recovered only when he had been forced to
156 treat her. The gathering of traditional foods and the weaving of
baskets had been part of her skills. A sweat lodge stood outside her cabin. She spoke Klamath and knew the native myths and songs.

Yet equally, she was a product of the Agency school and had worked at the military post of Fort Klamath. When she married, she wed her husband at the Methodist Mission. Together, they ranched together on Klamath Marsh, and with her daughter and

grandchildren, she was a familiar figure in boomtown Chiloquin. 648*
Cured by the Shakers, she almost joined the church, then changed 657*
her mind. From her bed, she discussed a life-way that was an 159
indissoluble blend of diverse elements integrated by their per- 178
sonal import. When she narrated or discussed a Klamath myth, 177
her assimilation of a Christian ethic was evident in the delicate 156 •
manner in which she skirted obscene passages. In admonishing
her great-grandson, she spoke in the traditional manner, but in
English, the only tongue they shared. The English she spoke, like [191]
that of her boarding-school contemporaries, was likewise syncretic; for it bore the impress of Klamath sound patterns and grammatical categorization.

Individuals such as she, often happy to escape from the gray 648*
reality of age into nostalgic memory, initially struck the observer 657*
as conservative when contrasted with the young people: the boys 156
in Levis, cowboy boots, and leather jackets, the girls in jeans and 177
plaid shirts, who spoke little or no Klamath, and who loitered 178
in the cafes of Chiloquin hanging on the heavy beat of the jukebox. Yet at most, such folk were old-fashioned, and still retained the tastes and inclinations of long habit. Their commitment was selective. Those who still liked to dig the roots known as ipos did so, not with an aboriginal digging stick, but with the more durable iron counterpart made years ago by the Agency blacksmith; and they traveled to and from the grounds, not on horseback, but in the most modern of automobiles.

If there were tribal members who wanted to have as little as possible to do with whites, they did not thereupon stop speaking English or give up their houses, cars, and radios to accomplish this. They continued to purchase food and other necessary items from white merchants. Indeed, their hostility might find short shrift from another Klamath who commanded more knowledge of the traditional lore and still recounted the old myths to her grandchildren, yet possessed many friends among the whites.

Clearly, there was at Klamath in the latter days of the reserva- 648*
tion no clearly distinguishable category of the "native-oriented," 657*
in the sense of a preferential adherence to the institutions of 177
native life. Deliberate retentions rather served as the diacriticals 178
marking an ethnic nationality.[20] The use of the Klamath language [191]
to signify an Indian estate was one marker. It might be used on

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

*648 surveillance; they have then had to make their peace in another
*657 community. In other instances, measures—for example, early
177 sawmills, drought cattle, loan funds—designed by the administration
to be instrumental in helping the Indians to attain distant goals of betterment, were diverted by tribal recipients to provide short-range benefits. Such action, present even in early times, became more pronounced as disillusionment set in; and organized forms of opposition were also added. In a formal character, there
[619] was an insistence upon the prerogatives that marked tribal
identity. Hence the highly emotional attachment to treaty rights, in however altered form hunting and fishing may be exploited; to the tribal government, however criticized its incumbents; and to the self-preserving myth of the past.

*648 There is, however, another side to the Klamath reaction which
*657 is to be seen in the anomic aspects of the life of Intermediate and
177 Inframodal segments of those dwelling in Chiloquin—although
182 this behavior was not limited to that city. Within Chiloquin,
184 those persons manifest many of the traits that Leighton terms
• 156 disintegrative: a high frequency of broken homes, of hostility,
crime, and delinquency; weak development of associations, recreation, communication, and leadership.[8] For the community as a whole, their effect is accurately characterized by his term. At the same time, their behavior had acquired such substantial predictability that the city fathers had come to rely upon it in the form of revenues from the municipal tavern and fines and trusty labor, for a considerable portion of the municipal budget. Under these circumstances, one might fairly say that a stabilized cultural pluralism existed.

*648 A situation like this cannot fail to leave psychological marks,
*657 and indeed Clifton,[9] observing that "there is very little evidence
177 to suggest, unequivocally, that guarded restraint was a dominant
156 component of aboriginal character structure," considers that
attribute to be largely a reaction to the complex unpredictabilities of the reservation. Indeed, the Klamath reaction has striking
[171] parallels in the "hostile dependence" of the Sioux[10] and the
"valuation group alienation" of the Aleut;[11] and it bears close resemblance to the situation described for the Ojibway by James,[12] who sees the personality traits he analyzes to have their source in the immediate context of white-Ojibway relations.

3:Stern E-4,5 (1949-1957) 1965 NR10 Klamath NR10

[Klamath Reservation]

Those same traits others[13] had held to be conservatively Ojibway; 648*
and marking their counterparts among Menominee and other 657*
peoples the Spindlers[14] propose to see in them a common survival 177
of psychological characteristics shared widely by American Indians. 156 •
Underhill,[15] by contrast, accounts for the commonalty by 171
reference, like James, to experience in a shared situation, the reservation.

These differences of interpretation are by no means irreconcilable.
The writer would agree with James[16] that "the genesis of [114]
the modern Indian self lies in the social processes that constitute reservation life," but he would include among those processes such relationships as may have survived in the peculiar cultural environment furnished by the reservation.[17] Favored in persistence 648*
at Klamath have been generalized characteristics, rather 657*
than complex and specific traits. They have survived in part 156
because they are inculcated during childhood;[18] and the family, 177
within which child-rearing takes place, is one of the structures 178
that has retained distinctive qualities. They are sustained in the [571]
quality of primary relationships and are rooted in the individual, often at an unconscious level.[19] As Spencer observes, "The diffuseness of the social structure may be regarded as a survival from the heritage of the past, while individual activity continues to be couched in essentially aboriginal terms."[20] Reservation existence has provided, however, an ever changing context—albeit somewhat sheltered from the rapidly changing environs—in response to which enduring features have undergone modification.

To take the quality of guarded restraint, which Clifton regards 648*
as characteristic of the personality configuration of modern Klamath, 657*
one can indeed trace continuities with the past. In the 156
myths there are present themes of watchful waiting and the use 177
of subterfuge in dealing with strangers and foes, and a wary 178
reserve in conflict with affinals.[21] In traditional relationships, as 571 [538]
Spencer has shown, sub-rosa patterns of aggression characterized "hostility . . . driven underground" by public disapproval.[22] That covert revenge has persisted is evidenced by historic records of several murders, of such acts as the firing of a haystack in 1897, attributed by the victim in part to the perpetrators' "envy of his prosperity . . .";[23] and to modern incidents of the same nature. Today jealousy is frequently attributed to unspecified others,

[Klamath Reservation]

*648 usually Klamath by inference and to be identified only in part
*657 with feuding groups. It may well be that such a projection is an
• 156 indication in many modern Klamath of an alienation from their
177 own membership group. More central to the issue taken here,
178 however, is the probability that under the tensions of reservation
571 life guarded restraint, once restricted to a few role relationships,
has become generalized to a much broader range of contexts, while at the same time it has grown to be a pervasive characteristic of Klamath personality.

*648 The modern situation at Klamath, with its measure of human
*657 disengagement, apathy, and generated hostility, may be inter-
156 preted by some as justification for the abolition of the reservation
177 there and as an indictment of reservations everywhere. Such
178 conclusions are likely to be far too sweeping. The Klamath situa-
tion was a consequence of a reservation become a holding operation, with a program that had ground to a halt. Ironically, termination of the reservation was founded upon the premise that the Klamath had attained a successful level of integration with their white neighbors. It may not be concluded that problems have automatically been solved by the action taken; nor may it be maintained that other, less drastic steps, if taken in time, might not have proved more effective.

*648 For many Indian peoples reservations are a highly significant
*657 reality, constituting the only familiar homeland, the major con-
171 tinuity with the past, the sole real property, and the principal
token of the government's resolution to honor pledges made long ago. At the same time, chosen with an eye to native exploitation or to the needs of the small farm of the nineteenth century, they are often unfitted to support a population by current standards. They thus pose the dilemma embodied in schemes on the one hand for local development and on the other for the relocation of Indian families. Sweeping measures are inappropriate; each reservation merits consideration in its own terms. Yet it would be shortsighted to seek only for material advancement, essential though this is; for, as the Klamath instance shows, unless the program give men hope, they languish even in prosperity.

Individuated family relationships and the instability of the marriage tie have 593
other ramifications. Parental care-taking activities are minimal and are sometimes 855
non-existent. Given the pattern of drinking and partying, children are [581]
frequently abandoned to the care of a hired baby-sitter for days at a time, [181]
or to an older relative, or to an older sibling. If the party occurs in the
household, children may temporarily be moved elsewhere, or they may simply be
left to shift for themselves. Thus at crucial developmental stages children may [603]
find their identification with parents broken by alternating periods of presence [155]
and absence, and their affections given over to an older sister (the picture of
the determined little twelve or thirteen year old "child-nurse" is a clear one)
or to a grandmother. When parents are present, Klamath children are usually
faced not only with minimal care and attention, but with indifference and aloofness.
The father especially is dissociated from significant relationships, and
both he and the mother are frequently given to unpredictable and alternating
fits of love and anger. Thus within the nuclear family, there is little experience [155]
with consistency in role relationships.

Thus the first years of life are spent by the Klamath child in a loosely bonded, [602]
amorphous household group, and he has some lesser, but important ties to other
kin. At age six the Klamath child attends a local public school. Reflecting 872
the incohesiveness of the family group, these children are accustomed to lax, 861
permissive controls of their behavior, and are not accustomed to confronting clear-cut,
specific, over-riding standards of conduct. At the same time they are not [593]
accustomed to maneuvering opposite a single, stable authority figure. Yet [181]
these children are characterized also by a dependent craving for affection and [155]
attention which does, initially, facilitate adjustment to the school milieu.
In contrast, they frequently anticipate rebuff. In later years the latter seems to
be the stronger inter-personal need, and the growing child becomes increasingly [156]
characterized by a kind of defensive isolation from close personal contacts.
This may be adequate training for participation in contemporary Klamath culture,
but it hampers and restricts adaptation [illegible] larger society.

In many respects the values and skills [illegible] within the household to not adequately 155
prepare the child even for school adjustment, with the requirement of 156
regularity and time-mindedness. Similarly, the daily routine within the household [871]
may be such as to impede the child's getting to school on time, or it may
throw the responsibility for attendance on very young children, or it may get
him there unfed and, by school standards, improperly clothed. At the same time
the child may have had recited for him, or he has surely overheard recounted,
the myth of Klamath racial inferiority. Too frequently this belief in inferiority
is assimilated as a segment of the growing child's self system, contributing
in turn to his acceptance of poor performance, to a bitter rebelliousness,
or to a destructive pride. The same experience reinforces the expectation
of rebuff, if this time somewhat more consciously. In fact, in later school [563]
years the Klamath adolescent does meet with informal racial barriers in the [582]
areas of courtship and dating, for the path to inter-marriage with local Whites
is not an easy one.

It is at this juncture, in early adolescence, that parental controls of the child 882
are almost totally relinquished. Made thus culturally independent, the child 156
may then enter high school and find that for the first time he has to compete 155
with his peers, for there are few social promotions in high school. Because he
is fully aware of his economic independence, and because of the other factors
cited, the pattern is for Klamath children then to find themselves propelled into
an adult status. The associated school phenomena at this juncture is a high [871]

882
155 drop out rate of Klamath adolescents, a slacking of attention, and a decline
156 in test performance and grades.

871 Something of the character of adult Klamath concerns and behaviors has already
been suggested. Many work in only a desultory, disinterested fashion, and it
156 is unusual for a Klamath woman to have a full-time job. Thus self-concepts are
[461] not so closely bound to job or profession as are those of local Whites. In
1953, for example, it was found that 65% of adult Klamath were wholly or partly
434 dependent upon per capita payments for their livelihood. Whereas the reluctance
of Klamath women to take outside work reflects the pressures on them to remain
[462] in the home and the extent of their responsibilities there, it also reflects
the fairly secure economic position resulting from the special benefits of
tribal membership. Aside from the twice-yearly per capita payments, these benefits include the privilege of year round hunting and fishing, medical care, loan
services, tax exemptions on land and privileged employment rights at the Agency.
[464] On the other side of the coin, outside of the Agency, the principal local employers are Whites, and for one reason or another they are very reluctant to hire
tribal members. In historical perspective, the development of tribal income paid
out in the form of per capita payments has paralleled the decline of Klamath
participation in the labor market. The contemporary Klamath do not work so often
nor do they work so steadily as did their parents and grandparents. There are
fewer Klamath loggers now than there were in the past, almost no business men now,
and fewer active ranchers and farmers.

434 In spite of shifting policies and personnel, the influence of the Klamath Agency
657 ~~officials~~ has been one of constant supervision over and intervention into the
affairs of Klamath individuals and groups. The controls over the expenditures
of children's funds was noted, and the same controls are exercised with respect
[241] to those tribal members who have been deemed incompetent. Yet the activities
of stable ranchers and farmers have also been supervised by extension workers,
[654] and efficient, prospering Klamath farmers complain that, with a good price decided
on and a buyer waiting, they have to await the approval of an extension worker.
Thus the adequacy of Klamath individuals is frequently in doubt, whether by experience with a particular tribal member's high style of living, or by policy.
657 At the same time in many ways the Klamath have been protected from responsibility
for their own actions. Payment for debts incurred with local merchants is an
426 example, for the reservation being under federal jurisdiction, goods unpaid for
could not be repossessed, nor could income be garnisheed. As Stern and Swanson
phrase this situation, the Klamath have attained economic security "attended
by supervision."

657 Of course, through constant experience with Agency personnel and policy the
829 Klamath have learned that bureaucratic restrictions may be evaded or circumvented, and they have long since acquired knowledge of the appropriate manner
of phrasing a request for funds or services. The Klamath complain of this that
forced contact with the Agency has made liars out of them.

648 In summary, little more than a century of contact has merged the originally
177 distinct Klamath, Modoc, and Paiute, and has altered them physically, culturally,
171 and personally. In spite of a small assimilated minority and a large off-reservation population, the reservation Klamath exhibit a distinct way of life
657 which is novel if heterogeneous. This Klamath Reservation Culture is the
familiar context of everyday experience for contemporary tribal members. Thus
181 it is the source of what stability and security they know. No matter how variant,
or how disorganized this pattern of life may be, it is one whose outlines are
the consequence of the thousands of daily decisions, the many lines of action,

121 (Levine, 1960) has indicated that this may be an extremely important measure
125 of ego strength. Whether this is supported in cross-cultural work remains to
[114] be determined.

121 The emphasis throughout this phase of the research has been on the functioning
15 individual — how he adapts to his environment in general and, whenever possible,
how he behaves in interpersonal situations. In this regard Piotrowski's hypothesis that the movement responses reflect prototypal roles has been exploited extensively. By prototypal roles, Piotrowski means, "definite tendencies, deeply embedded in the subject and not easily modified, to assume repeatedly the same attitude or attitudes in dealing with others when matters felt to be important and personal are involved." (Piotrowski, 1957, p. 141). He makes it clear that he is referring to "psychological tendencies" only; in order to predict whether these tendencies will be expressed in overt behavior it is necessary to take into account many other variables (Principle of Interdependence of Components).

Piotrowski has written further that the FM (animal movement responses) reflect the subject's prototypal roles as they were prominent in the subject's past or as they influence his behavior in "states of lowered integration and in states of diminished consciousness and defective self-control," and, finally, that the m (inanimate movement responses) "indicate prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable."

Thus, for example, if a subject gives only very active or aggressive human movement responses (e.g., "two boxers slugging it out") it is hypothesized that his prototypal role is of this nature. If his FM are passive and his M are aggressive, we conclude that his present prototypal role is aggressive, but that when drunk, for example, he is more likely to become docile.

In actual Rorschach interpretation the complexities of multiple roles, the influence of other Rorschach variables, the inconsistency of role patterns, and
so on, must all be evaluated very carefully in order to arrive at a meaningful
121 and valid personality description. Although considerable care must be taken to
181 avoid oversimplifying these interpretive principles, their judicious application
is often very helpful and may have led to the most important conclusion of the
•156 present investigation: that the Klamath are characterized by a guarded and
[17] restrained approach to life and interpersonal relations. This guarded restraint
is different from the Trukese blocking and from the dull apathy of the Alorese. The Klamath initial reaction times are not nearly as long as the Trukese, nor are their dark shading responses as primitive and poorly organized. On the contrary, their initial reaction times are only slightly longer than would be expected from a U.S. White group and their dark shading responses are almost as well organized. The guarded restraint of the Klamath seemed to be neither the result of marked blocking nor apathy. A more detailed discussion of this hypothesis will be appropriate, however, after the case studies have been presented.

*159 ©156 Slim is a restrained, dignified person who is very accepting of his status as an Indian, but who does not make too much of it. For example, he dislikes the annual Indian get-togethers because of the gaudy commercialism. A person who admires a strong, consistent leader, Slim deliberately avoids unreliable and erratic persons, for which reason he does not much participate in the reservation drinking cliques. He is one of the most assertive and sociable Klamath known to the writer. In his interactions he maintains his dignified, independent stance, yet reacts freely and responsively to others. He gives little overt indication of hesitancy or inhibition, and if anything is perhaps mildly boastful and pretentious. If a phrase will describe his outstanding characteristics, it is a well-fed, complacent hedonism. There is one thing which his white friends have against him, and that is because he is well respected and liked they are displeased because they cannot draw him into more community activities, which invitations he rejects with the disclaimer that "I'm too itchy footed to join that, I may want to leave for Washington next week."

Susan: Female, Age 24

Background Data

•156 Unlike Slim, Susan is not so well liked or respected. The occasion for this is
*159 specific, an unsanctioned pregnancy during her last year in high school and a
[848] more recent marriage to an entirely disreputable Mexican from Utah. This community
[582] evaluation is accentuated because of the very high respect in which her own family is held. Everyone expected better of Susan.

[626] Susan has worked as a dishwasher in several cafeterias, both on and off the
*159 reservation, and moved to Utah so as to take a practical nursing course. She found this training uncongenial, met and married her husband, and they returned
[464] to the reservation when his small business failed. Susan is a high school graduate

[874] Susan's mode of selecting a husband parallels that of her mother, who met her
*159 husband while hospitalized in New Mexico. Her father by birth is an Apache Indian, and by cultural affiliation a southwestern United States Spanish-American.
593 Without doubt, he is the most autocratic, stern, demanding, rigid adult male on the reservation. Although a married woman with children of her own, Susan must ask her father's permission to use the telephone or to walk downtown. Her mother was Klamath and very well respected for her stable family life and for her active participation in many community activities. Susan was extremely close to her mother until her unexpected death several years ago. They were known as an inseparable pair and her mother never went out of the house without her. The mother's death was, perhaps, the major cause of Susan's failure to complete her nurse's training. Susan's illegitimate pregnancy in high school was a considerable shock to her mother and is, with her marriage, a continuing source of strain
[155] with her father. Susan evidently feels that her behavior was a contributing cause for her mother's death. She made a death-bed promise to her mother that she would not be a loose girl and that she would marry and stay married to one man. It was shortly thereafter that she married and returned to the reservation to live with her father. There is much strain within this household, derived from the relations between father and son-in-law, and from Susan's unsuccessful efforts to serve two masters, for along with her marital relationship she evidently
[626] was trying to act as a replacement for her deceased mother's role. At the same time her conduct has alienated her from the church, from family friends, and from the community.

*159 The contact with Susan was made via her father, who told her that she should
[124] cooperate. Her father's motivation in this was not, as may be supposed, the conviction that she needed testing because something was wrong with her, but involved
[123] a more general sentiment. He felt somewhat honored to have an "educated man" visit his house and that such a contact was a good experience for his children.
[593] Susan accepted this like an obedient, dutiful daughter. She came readily, with no indication of unwillingness, and relations with her were quite good, perhaps because of the strains of her marginal position and her need to talk with someone.

*159 Susan seemed an apathetic person whose feelings were dulled. If anything, her
157 reactions were those of an over-trained, too obedient child. She was not very responsive or active, and would seldom talk except to answer a direct question. Then she would, frequently with evident pain and anxiety, describe her feelings and situations tersely and haltingly. Susan clearly wants more than her life now gives her, but cannot define her present conflicts or see her way clear to

159 157 psychotic symptoms, despite serious emotional disturbance, "because they control, or have reduced, the intensity of their emotional and intellectual processes to such a degree as to produce hardly any specific and easily recognizable schizophrenic symptoms." Their "capacity for energy control (shading) exceeds their capacity for energy output (color)" (Piotrowski & Levine 1959: 223). Thus, having expended all their energy on controlling their behavior and feelings, they are left with little energy for constructive effort and planning (low W).

[171] [154] This pattern may reflect a pathological adjustment in a white American whose culture demands long range planning and constructive effort. In the Klamath group, however, this emphasis on day-to-day pleasures and consideration for others may be more acceptable than the long range planning and self-aggrandizing behavior which is reportedly becoming the acceptable pattern in American suburbia. If this is true, this subject's adjustment may be perfectly fitted to his environment.

There is, however, additional, independent support for this description of this subject's personality. His preoccupation with the inner details (R2, R4, R24) indicate an approach to life characterized by over-cautiousness —almost suspiciousness — a peering into the situation, rather than an acceptance of it at face value. At the start of the test, he apparently requests clarification of the instructions. The analysis of the movement responses also will support this interpretation.

Despite the verbosity there is actually very little of this man's inner life reflected in this protocol. Rather than reveal himself, the S analyzes the subtle nuances of what is going on around him. He is like the "cat" on Card VIII, "he's watching something...I've no idea (what he's watching)...just watching...". The number of faces and the emphasis on "eyes" (especially the "dark beady eye" on Card IX) are also consistent with the interpretation that we are dealing with a suspicious person — he doesn't trust anyone very far. So all his energy (the little he has) is concentrated on analyzing the possible dangers in any situation, not viewing the situation for all the positive possibilities it offers.

[154] His pace is generally even except for delays to Card IV and VI, the darkest, most ominous of the blots. Is he disorganized by the depressive implications of these stimuli? If so, we would conclude that he tries to deny the gloomy aspects of life. The sun on Card II is "coming up," not going down and there is a kind of exuberance in his response to Card X. One wonders if he isn't trying to act the part of an optimist, despite occasional qualms about this position.

[156] The only human movement response in the record is R6: "a caricature of two people" and on the inquiry, in response to a question, "I guess they're dancing - jitter-bugging I guess you'd call it." The movement was very slow in being verbalized, it was dehumanized (they are caricatures, not real) and it is stereotyped. As such, it probably does not reveal much of this man's conception of his role in life. Unless perhaps it means that he does not have a well-delineated prototypal role.

The FM, on the other hand, seem to reflect a more consistent image. R10 and R15 (the dog "looking straight at you" and the "watching bobcat") are both scorable as "guarded restraint" responses and indicate that this man's cautiousness, his "watchful waiting" have been past roles and are likely to appear in states of diminished control. He is not guilty or anxious about behaving in this manner.

Sparrow: Male, Age 63

Background Data

*159
[156] Sparrow's case is cited because of his position on the lowest rung of the local
status hierarchy. He is known as a happy-go-lucky, worthless old drunk and is
[872] generally considered as "lacking a few of his marbles." However, Sparrow is
seldom publicly disparaged, for local citizens simply pay little attention to
[464] him. He has a sixth grade education, gained at the Agency school. He has
apparently never worked consistently at any job, and most of his work experience
[434] has been as a farm or ranch laborer. He is and has for years been totally depen-
dent upon per capita income and the income from ranch lands owned by his mother,
with whom he lives. Their affairs are managed by a local businessman who some
years ago was appointed their guardian. He is the second eldest of four siblings.
After his father's death forty years ago, his mother remarried and bore two other
[586] children. He was married once when a young man, and after four years divorced
his wife because of "her shiftless ways." He is a semi-invalid, the result of
[164] an accident years ago when a drunken brother drove over him with a truck, crushing
[191] his pelvis. He speaks fluent Klamath, the result of constant association with
his aged mother who represents a direct link with the aboriginal Klamath past,
as well as adequate English, learned in school.

[733] Much of Sparrow's time is spent in jail for drunkenness, in the local tavern,
with one of the drinking cliques, or passed out in a doorway. When he is not
totally drunk he spends much of his time with his mother, for whom he cares in
his fashion. Occasionally he goes fishing in a nearby river. For at least
twenty five years, this has been the pattern of his activities.

*159 Sparrow has many skills, among the most striking of which is the ability to
154 "fly from here to the Agency without once touching the ground." There are
several dimensions to this delusion, one of which is an association, in Sparrow's
thinking, with the acquisition of power. When a young man he dreamed of acquiring the power to "rise up off the ground, like Jesus Christ." While such a belief may have aboriginal correlates, there are no Klamath today who would accept it as valid. Sparrow keeps this secret to himself, and relates it only to strangers and transients from whom he intends to borrow money. His other skills include the following: the ability to keep house and cook, harness making, leather working, painting, canning food (the notion involves laying in stores for the winter), tanning buckskin, wood carving, carpentry, poetry composition (in Klamath), arrowhead making, making traditional basketry, stock raising, restaurant management, and finally, the ability to bewitch rich old white ladies, who are captivated by him and who drive him about in their white Cadillacs. The latter may be associated with a recurrent dream of meeting with a white buffalo, also a symbol of power, but it is difficult to say, for there were never any buffalo near the Klamath, and it is more likely that he has got this idea from reading western stories. Needless to say, most of these skills are quite delusional also. There is no evidence for any of them being more than this. Relating one or more of these is Sparrow's single style of interacting with others, for in reaction to a question or another's anecdote he will sift about in his memory until he comes up with one of his capacities which seems relevant. Very frequently, the writer could not see where or how they were appropriate, but for Sparrow there seemed to be some connection. He relates these matter of factly, with only the most slight suggestion that they were self-enhancing, and no indication that he meant to justify himself, and will then coyly watch his listener to see if he is properly impressed. This behavior tends to merge with Sparrow's

Nell: Female, Age 33

Background Data

In contrast to Sparrow, much of Nell's behavior is disparaged and negatively 159*
sanctioned by the community, while she too must be located at the lower end of [156]
the status hierarchy. Nell got her first job when she was 18, and for the
last five years she has been working steadily as a clerk in the Agency. She [464]
is a high school graduate and has 2½ years of business school training. Except [874]
for being away at school and a short period of residence with one of her hus-
bands in Oklahoma, she has lived all of her life on the reservation.

Nell was raised by her own parents on their ranch and is the second eldest of
nine children. Her earliest memories are of being fearful of domestic animals
and of preferring to be by herself, playing with her dolls. She seldom played
with her siblings or with other children, and her interest in dolls and making
and dressing paper dolls continued through her first marriage in her early
twenties. She felt that her mother always blamed her or the other girls for
everything, while her father favored his daughters. All of the children were [871]
sent away to boarding school, and most of their childhood was spent away from
home. By the age of 12, when home, Nell was busy with housework, cooking, baking, [857]
and caring for her younger siblings. In this large nuclear family there was an
extensive division of labor, with each assigned his or her specific tasks. Her [593]
parents never left their children with "sitters" or relatives. Their "caretaking"
activities are, perhaps, among the most consistent and extensive in the area,
with the exception of the boarding school. Nell received little direct instruc- [868]
tion from her mother, and her closest adult woman companion was her grandmother.
Nell knows none of the Klamath language. Both her mother and her father were [191]
disturbed because Nell always wanted to be off by herself. When she was in
boarding school her parents visited her once or twice yearly, but they never wrote
her. Nell preferred her father, and when she grew up she felt that her mother
was not the kind of person she had thought she was. Nell feels that this may be
due to her own behavior. She received no direct sex training, and was 18 before [864]
she discovered the significance of her menses. Her first sexual experience was
at 8, when she was molested by a cousin.

Nell has always preferred to play with boys rather than with girls. Today she [626]
is socially isolated at her office, where none of the other women speak to her. [156]
She is equally isolated from her family, who rejected her and threw her out of
their house when she was 20, at which time she was pregnant by her first husband,
who had deserted her when he discovered her pregnancy. She has been married and [586]
divorced three times and has maintained a regular liaison with at least five
other men. She will go directly from one such liaison to another, with never [156]
more than a few days between men, and on several occasions some overlap. Occa-
sionally one of her ex-husbands or ex-lovers returns to live with her and attempts [588]
to take up with her again. She has borne eight children, has had two miscarriages,
and at least one abortion. She cannot tolerate not having a man in the house
(it is her house maintained at her expense). Several of her children are tech-
nically illegitimate and the paternity of at least one is in doubt. It is this 159*
sexual laxity which particularly brings down the ire of the community upon her. 156

Nell thinks of herself as an unfriendly person who would rather be left alone,
particularly by other women. She always waits until someone else makes the first
advance. It was therefore surprising to have her show up one day and request [124]
testing and advice. She was in trouble and she was convinced something was
wrong with her. The "presenting problem" was an unbearable load of shame, guilt,

*159
156 and anxiety associated with her responsibility in a double murder. She had
given a rifle as a present to a lover, and following a drinking party at her
house he had killed his brother and a stranger with it. Her thinking was extremely morbid. She expresses the wish that the more violent of her previous husbands would return and kill her.

*159 In the testing and interview sessions Nell's behavior quite definitely was not
representative of her ordinary interactions, and once she felt somewhat relieved
157 she immediately got more distant, withdrawn, and unapproachable. During testing
[124] she exhibited a high level of manifest anxiety and an erratic pattern of interaction. She was alternately over-talkative and quick to reply or to initiate
[152] a sequence, and then silent and down-cast. Her concern was real, for it was
known that she was under suspicion for complicity in the murder, but this was
not the root of her anxiety. What the connection was cannot be evaluated from
available evidence, but it may be that her conflicts were related to the trouble
her lover had gotten into, for it was his situation she wanted most to talk
[156] about. Normally she is relatively inflexible in her relationships and preserves
her withdrawn and isolated position at all costs. Her behavior then exhibits
a high level of drive, but is poorly organized, confused as to goals, and produces repeated overt conflict with lovers, husbands, her parents, her children,
work associates, other community members, and law enforcement agents. Still,
she expresses the need to be cared for and dominated consciously, as well as the
156 feeling that she was being persecuted and rejected. She feels herself to be an
entirely worthless person, and this evaluation is shared by the community at large.

Rorschach Record

125 Note: With little variation between cards, each was approached by the S. in
*159 the following manner: She would take the card, repeatedly twist it and turn
it, swiftly cover portions of the blot with her hand or fingers, hold it at
arms length, hold it closer and examine it carefully, lay it down momentarily
and stare off "thinking," and then after a silent delay of an average 145" spit out a series of responses rapidly, as if they were hot peas.

No. of Resp.	Score	Time	Response
			I
		155"	I can look at them any way?...it doesn't even make sense. Do you want me to tell you right now?
(1)	W Mc' h		All I can think of is witches

(I: W) (What suggested?) Might be this...reminds me of a cape blowing out. These points remind me of a sharp hat. (Cape blowing?) Just like when you see them on

Carrie: Male, Age 38

Background Data

*156 Carrie is the model of a self-made, upwardly mobile, brash and back-slapping
*159 young American male. He is a tribal leader whose power is rooted in an amalgamation of various dissident elements, rather than in a large kin group, and a
[622] business man with numerous interests. He says, of himself, that "I have no occupation, as occupations go. I guess you might say I am a confidence man."

*159 Like the other subjects, Carrie was raised on a ranch by his parents. He is a high school graduate and a graduate of a junior college course in accounting.
[873] His work record suggests his ambition and his upward progression, for he started as a farm laborer, went to truck driving, then worked during World War II as
[464] a production machinist, completed his education, then worked for the Agency and, finally, was able to settle down to living off his several sources of income. He has never been out of the state except for short business trips. He spends most of his time on the reservation attending to tribal and his own business,
156 and participating in various voluntary and formal associations. More recently he has become active in politics on a local level and by some has been ear-marked
*159 as a "comer." His intellectual horizons are very wide, extending to a keen
[661] awareness of the difficulties faced by Dag Hammarskjold. His reputation is excellent and he is particularly esteemed by many Whites, although this esteem is
[626] not shared by all Klamath, which reflects only the factionalism of Klamath politics and, perhaps, the efforts of some to control a man who is too successful.

[184] Carrie has been married once and this marriage has lasted 15 years. He has six children and his family life, again, is precisely what might be expected of a successful young American. Carrie's entire style of life is entirely different from that of most other young Klamath men.

*159 Very little is known of Carrie's early life except that his background is rural Klamath and that his mother was a housewife and his father an indifferently and intermittantly employed laborer.

156 The writer never made much headway with understanding Carrie until the day he
124 was brow-beaten into taking the Rorschach. Before this time he had been seen only as an aggressive, back-slapping, competitive, and somewhat empty character. He had agreed to testing, but had managed to slip out of several appointments until one day when the entire complement of field workers descended on him during a visit, arguing and insisting that he had to set the example. Carrie was thus hung on his own petard, and when we walked into the testing room there was some question as to who was the most fearful of the consequences of this episode, Carrie or the examiner. Carrie was manifestly tense and fearful, but in a very short period of time relaxed and accepted the test situation. Rapport was excellent, and Carrie clearly defined the situation as one where he should discuss
156 his private concerns, motives, and sentiments. From sessions like this it became evident that Carrie's brash front consisted of a set of behaviors he saw as appropriate to his position. That is, the social Carrie was a well defined role. Behind this persona lay a genuine concern with the welfare of tribal members and their future, as well as strong personal aspirations, deep committments to family and community, and fears associated with his private feeling that he was not an adequate or relaxed "mixer." He stated, for example, that "I guess I just don't have the courage to get out, even among my own people. I'm not much of a talker and I guess you'd say I'm kind of backward. I really prefer to be alone by myself." Some of this apprehensiveness is associated

with his concern with losing the support of his constituents and his feeling that he was not really "in" with or a member of the White group. In many ways Carrie dreads the future, feeling that he has over-extended himself. Thus, as well as being the source of satisfaction, social esteem, and profit, Carrie's achievements are a continuing source of anxiety. He suffers the pangs of success. 156

(1)	D	F	a		45"	Oh, I see (rotates card) it looks like two different things to me. The one way it looks like a bug.
(2)	W	F	at			And this way it looks like the bottom vertebrate of an animal of some kind.

(1) (Entire center area, D1) That could be his legs. Some kind of a bug or a beetle. A water beetle maybe. () It was the form mostly. (2) (Down, center blot) () It was the form mostly—the shape.

						II
(3)	D	FM	a	P	43"	It has to look like something? Well this way it looks like two dogs that got their noses together...or sheep...or some animal.

(3) (Entire dark area, D8) See here...the darker ones...or even a bear...a couple of cub bears. It looks like they got their faces together. There it would be the form or shape...what's the difference between form and shape?...Just the darker ones. I couldn't distinguish anything with these red blots.

						III
(4)	W	M	h	P	50"	This looks like two people trying to lift something...lift something up off the ground.
(5)	D	FM	a			And two little objects falling. Looks like two birds falling to the ground.
(6)	D	FMC	a			This object in the middle looks something like a butterfly...a red butterfly.
(Add 22)	D	F	at			A skull

(4) (Black area, D13) They're pulling hard on this...either pulling together or against each other. (men or women?) Might be women because they got a big chest on them (chuckles). (5) (side red details, D21) They're probably shot the way they're falling. (6) (center red, D20) I couldn't think of anything there but a butterfly. (What kind of BF?) Well, it looks like it's in flight. (Add 22) (Bottom center, D18) That object that they're pulling on does look like a skull of some kind.

						IV
(7)	Dr	F	a		75"	(Several rotations) This thing reminds me of a bat...but it doesn't look like a bat.
(8)	Dr	Fc'-	a			The dark outline's got a face...it looks like a wild boar to me.

(7) (down, darkest parts of entire blot, indistinctly outlined) Not the whole thing just the darker part looks like a bat to me. (8) You can see the dark outline here. These are the tusks...and you can see the eyes. (down, same area. Both exclude D27 and D23).

Aunt May: Female, Age 58

Background Data

*159
[156] Like Carrie, Aunt May's social position is marginal to Klamath and White segments of the community, and she occupies a position of leadership, although
[184] hers is of a more informal variety. She has 8 years of formal education, but
in her words, has been learning all her life. She has been married four times.
[871] Two marriages were broken by the death of a spouse, one by divorce, and the
[586] fourth, to a White wage worker, to whom she has been married 20 years. One of
the tragedies of her life is that she has never been able to conceive, but she
[842] has made up for this biological failing by formal and informal adoptions of
numerous children, four of whom she had for at least for three years, and one,
[597] an adolescent boy, since birth.

Unlike many of the other subjects, Aunt May is a town girl, although she has
spent some time on a ranch in her youth and would now prefer to live in the
[756] country. When she was young she seriously considered becoming a Shaman, and was
closely identified with one of the surviving "Indian Doctors," but she became
dissatisfied with the prospects of this role. Yet she remained ambitious and
[874] wanted something more for her life than the "other Indians" were getting. She
took up with a white woman who put her to work and trained her as a seamstress.
[759] She became an accomplished mid-wife and frequently will answer to the query if
she knows a certain party, "Do I know him? Why, I cut his umbilical cord with
[857] a pair of my nail scissors." When a small girl she held the role of a "child
nurse" and more or less raised the remainder of her siblings. In recent years
*159 she was literally dragged from her home by a group of white ladies who wanted
156 her to attend their church, a church, which as a girl, on Sunday mornings she
had stood outside, wishing she could enter. She is the social center of gravity
177 for two large but separate circles of Klamath and Whites. She is one of the
184 few Klamath women with whom elite White ladies will associate, and with them
her position is so esteemed and secure that an invitation to her house is highly
[794] valued. For her Klamath friends, relatives, and "pick-up" relatives (i.e., persons she has taken to her bosom as her own flesh) she is a confidant, an ad-
[608] visor, and an out-spoken critic. She is out-spokenly critical of many patterns
*159 of contemporary Klamath life, particularly excessive drinking and disordered
156 family life. "When I was a young woman I just stopped drinking. It was making
a mess of my life. I didn't want to be a wet blanket, though. I still went to
[773] dances and all. What happened was that I told the boys that I had broken my
glass." Aunt May's home today is one built with her share of tribal income,
[353] spotlessly clean, well furnished and homey. Every room of the house has its
walls and corners covered with mementos and souvenirs, each of which is associated with a treasured memory of a particular person and association. It is
noteworthy that these memories are her personal property and do not include her
[571] husband or adopted son. Most of her current social contacts are with Whites,
for although other Klamath visit in her home, she never visits in theirs, because she does not want to get involved in their arguments.

[157] Aunt May is an extremely assertive woman whose tongue is too often sharp and
biting, but every criticism is immediately followed by an effort to soften a
person up, reflecting her extreme sensitivity to personal relationships. Perhaps, like Carrie, this strong joking behavior constitutes an appropriate social
role. Aunt May is equally sensitive to the reactions of others to her and she
will call friends to task for imagined snubs. In public she sits erect and
quiet, yet attentive to all that is going on about her, and with great care

notices whether others are noticing her. Still she does very little directly to call attention to herself, for beyond this concern she is basically extremely shy and inhibited. She is a highly pragmatic person, although she easily expresses strong emotionality. The test situation for Aunt May was simply one of the many strange requests, her good friends, the anthropologists, made of her. 159* 156

157
*159 "girls tied together by hair," and "guys on cliff handing something to one another." The "cannibal" and "punished girls" responses are certainly aggressive enough, but what of the cooperation implied in the "guys on a cliff" response? The "men dressed as bears" and the "puppet show" are playful, assertive and free, while the "fan dancer" reflects that extra gaiety of which the subject herself seems somewhat abashed (she "breaks out in laughter"). These are all human movement responses and thus the subject is capable of experiencing [155] all the diverse roles reflected. In a person with fewer other resources this might lead to unbearable conflicts, but in this woman there seem to be the strengths which make it possible for her generally to utilize this flexibility, despite the conflict. These additional resources are reflected in the use of color and shading (dark and light).

Her color responses are generally adequate and of a positive kind — although somewhat shallow. The presence of many responses to the black and white are interpreted by Oberholzer (1944) as further evidence of shallow, lazy affect. Thus, she probably does not get too deeply involved with people. She can get along with others moderately well, but she really does not need them.

[126] The presence of six popular responses and an F plus % above 80 are sufficient indication of her ability to attend to conventional aspects of the environment in a realistic manner, despite her tendency to experience her emotions.

•[156] Nonetheless, there is the hesitancy in interpersonal relations which we have seen in most of the Klamath records. Here it is reflected in the disguise needed by the figures on Card II and the several aggressive M and FM responses. And she is still pretty unsure that the recent developments in her life are desirable; perhaps the old method of punishment was the best (R29). Probably the essential conflict in roles described above are the keynote of this woman's adjustment. Shall she "eat the carcass" or "lend a helping hand?" Shall she be a "fan dancer" or is any transgression punishable? The comments during the testing are both joking and veiled hostility: "Are you naturally pigeon-toed or do you just sit that way?"

But despite the richness of the record, the woman behind the record remains elusive. Could it be that her enormous flexibility in role taking has made it difficult for her to carry through one integrated life style to the extent which is necessary to call it her own? The Rorschach suggests that this may be the case. However, it is clear that her overall adjustment is a satisfactory one — perhaps eminently so.

Weasel: Male, Age 29

Background Data

In contrast to all other subjects Weasel's role in the reservation community 159*
is a totally negative, destructive one, largely that of a supposedly vicious [156]•
criminal. He was born and raised on an economically un-productive ranch, which
for twenty years or more has been the location of continuous drinking parties.
Weasel was raised within a circle of a pack of older brothers, half-brothers, [593]
and step brothers, all of whom were bigger, stronger, and more capable than he. [733]
His father has been an alcoholic for thirty years and has rarely worked or contributed
much to the organization of the family, which as a co-residential [592]
household usually included more than a dozen persons. In all, Weasel had 17
full and part siblings, half of whom are now deceased, three directly as a result [165]
of drinking, three from acts of violence or car accidents.

Weasel's formal education ceased when he was 15, in the ninth grade, at which [871]
time he was arrested on a burglary charge. Since then he has spent six years
in reformatories or penal institutions. He was tested while in jail on an [674]
assault charge. Shortly thereafter he was found not-guilty, then re-arrested [697]
and sentenced on a different assault with a deadly weapon charge to three years
in the state penitentiary.

Weasel has repeatedly moved out of the circle of the family group, only to
fail "outside" and return to its sheltering arms. For a time Weasel was a [542]
professional boxer, but one without much skill or stamina. He never won a fight
and his face shows the evidence of the capabilities of his opponents. His
membership in this profession did not last long, and Weasel states, rather
proudly, that the Boxing Commission expelled him "For conduct unbecoming a
professional boxer." Weasel was once married (a common-law marriage, which [588]
for Weasel's primary reference groups is well sanctioned) but this lasted just
16 weeks. During this period Weasel stayed sober, the longest time he has spent [581]
without a drink since the age of 12. Weasel was consciously trying to reform [733]
himself, but now feels that he was a fool to ever try. Additionally, Weasel [156]
has repeatedly made a circuit of nearby towns and cities either singly or in
the company of a brother or friend. These visitations have more of the character [579]
of raids than anything else, and Weasel is usually arrested in one or another
place and either charged or shipped out of town. [697]

In addition to being a minor criminal Weasel is frequently also the scapegoat 159*
for the aggressions of stronger men than he. He constantly asks for trouble, 156
but has never given any evidence that he can back of his threats with appropriate
force. His successful acts of aggression have always been sneak attacks, [186]
or attacks on feeble old men or young boys. He seldom attempts to avoid the
consequences of these actions, and, indeed, is frequently not able to do so,
because of his extreme drunken condition. He seems to obtain some gratification
from the minor prestige afforded his performances in these roles, but this
gratification is highly personalized and is not recognized as appropriate by
others. It may be that he has been attempting to build up his standing and reputation
within his own circle by acting out the role of a "dangerous Indian,"
but it would seem that he has been singularly unsuccessful in this. One aspect
of this behavior is his reputed skill with a knife. On two occasions he wanted
to obtain vocational training, once as a barber, the other time as a butcher,
both times implying that this would be a simple extension of his native talent.

Rorschach Interpretation

*159 157 Aggressiveness, almost of a murderous kind, is the first impression one gets from this Rorschach record. Despite the fact that he gives only nine responses, we finish reading the record with the feeling that we know a great deal about this man, but we are no longer convinced of the extent to which he is comfortable with his feelings of hostility.

[158] Perhaps the single most conspicuous feature of the record is the blatant preoccupation with violence, especially in the context of such a brief record and in the light of the personalized quality of the verbalization: "When you press the gun up close to something and it goes off and makes this powder burn — the red spots look like blood." In addition to this hostile content (R3 and R9), analysis of the scoring summary indicates that the subject has inadequate control of these impulses. His Sum/C is 4.5, which is very high in a record of only nine responses, and there is no M and only one shading response. (After much deliberation, it was felt that there was insufficient evidence to score shading in R5.) Furthermore, only one of his responses was determined by the shape of the blot alone, indicating that in practically all situations the subject is likely to be directed by impulses and feelings, rather than by intellectual considerations. The possibility that the seven whole responses constitute ego control and personality organization is contradicted by an inspection of the nature of the W. Of these seven W responses, five and possibly a sixth must be considered vague, diffuse, primitive responses to the global impression of the blot.

There are a few possible indications of some control mechanisms which operate sporadically, however. For one thing, he does not blurt out his responses impulsively; there are relatively long initial reaction times to all the cards. Secondly, he does give attention to the shading elements (R2 and possibly R5). Nevertheless, these constitute insufficient controls for the tremendous energy available (Sum/c:Sum/C = 2:4.5).

The long initial reaction times, the few R and many of the verbalizations point to a guarded, suspicious approach to life. This finding, combined with the absence of M, is strongly suggestive of a paranoid adjustment. Life in general, and human relationships in particular, is seen as a struggle: the response closest to an M is the "fighting blackbirds." However, the subject does not have very strong attitudes about interpersonal relations. His feelings about people are shallow and ill-defined. He does not have close friendships: the figures on Card I, often seen as human, are seen by him through transparent jelly; he rejects Card III suggesting a human movement shock; and his few R suggest that he is unwilling to extend himself in the test situation.

[156] The "coat of arms" response suggests that what little feeling he has for human relationships is focused on the overt signs of social status. He is likely to

be very much involved with how he appears in the eyes of others. This attitude, 159*
together with his hostility and lack of impulse control, may get him into con- 157
siderable trouble through inappropriate attempts to attain some semblance of [156]
what he considers status. This may appear as "attention-getting" mechanisms.

There is no need to ponder the question of whether this man is actually the
aggressor or the victim. He is both. At times, he probably instigates the
trouble. But just as often he is likely to be punished for his transgressions.
On occasion he may act aggressively as a result of some fancied aggression.
He doesn't trust anyone; no one is likely to trust him. He is essentially an
isolated person. His minority group status probably fits easily into this con- [156]
ception of his role in life and his essential feelings of isolation and rejection.

However, his last responses (especially R6 and R8) appear to raise doubts about some of our interpretations. These almost effeminate —artistic, at least — color responses: "coral rocks" and "modern art," coming at the end of the record as they do, indicate that beneath this belligerent facade, we may come upon gentleness, sensitivity, and passivity which might surprise us. He is capable of moments of deep positive, perhaps aesthetic, feeling. We must raise the hypothesis that this young man is really a "softie" who is trying to deny this trait in himself or, in other words, he is just a big bluff.

This pattern may suggest the psychoanalytic hypothesis of paranoia, namely
repressed and projected homosexuality —if we define sexuality in broad enough
terms. The suspiciousness, belligerence, interpersonal isolation and latent
aesthetic sensitivity all are consistent with this notion. At least some sexual [158]
disturbance seems indicated by the way he mutilates the fox skin on VI; all the
extensions are cut off.

One aspect of this record remains puzzling: the relation between the c and c'. We get dark shading (c') on at least two occasions (R3, R9) and light shading on at least one (R2). If R5 is scored light shading, there is a balance of dark and light shading responses and indication of anxiety, control and neuroses. If, on the other hand, R5 is a dark shading response, the balance of determinants becomes even more extreme in the direction of lack of control. Piotrowski's principle is that the c' are given by people who fight rather than flee from anxiety provoking situations. My overall impression is that this subject is more likely to behave in the "fight" manner and thus get himself into a considerable amount of difficulty, but the possibility that R5 is a shading response is unsettling.

The m response on Card IX, when interpreted according to Piotrowski's principles, indicates that the subject would like to "explode" but feels incapable of this kind of behavior. Since this is a subjective feeling, it does not contradict the position that he does act out in an uncontrolled manner; rather, it suggests that, despite sporadic outbursts, he feels tense, as if he is operating under a constant head of steam that doesn't let up, even when he does blow off on occasion.

This m, the possibility that R5 is a c response, and the positive affect expressed in R6 and R8 indicate that, although the subject has violent moods, he is far from comfortable in this role. He is tense, anxious, frightened. There may be something about him which, at times, another person can understand and sympathize with.

In general though, he is wary of others, they are wary of him, and "trouble [156]
is brewing."

Grandma Williams: Female, Age 67

Background Data

*159
156 Understandably, it is difficult to find a match for a person like Weasel, particularly in the instance of a woman who occupies a similar status. The few
[595] Klamath women who were like Weasel were not available for testing. Grandma William's position is that of the mother of a large, disorganized nuclear family
[733] like Weasel's, one marked by excessive drinking, violence, and promiscuity.
[83] She is a vigorous, hearty, earthy old woman who has borne eight children by three husbands. She is once divorced and twice widowed, her first husband
[587] having died after three years of marriage, her third after thirty-five. She
[871] completed six years of school, all that was available when she was a girl, and she has lived and visited for extended periods in Washington state, Missouri,
[178] California, and Mexico.

[657] Grandma William's mother was a traditional Klamath wife and mother, and her father for years an Agency Indian policeman. In her words, both her family of orientatio
[464] and her family of procreation have had "bad luck." This bad luck consists of numerous bouts with the law over acts of violence. Her father died in the Federal penitentiary where he was serving a life sentence for murder. Several of her sons have killed men in the past. One is reputed to have killed at least five, and he is now in a State institution. Her other children are noted for their violence, and local informants say of Grandma that they cannot understand how such "a wonderful, good old lady managed to produce so many worthless children."
[577] Few feel that she deserves such a fate. Community acceptance of Grandma Williams is based upon several attributes, her steady, hard work, her commitment to raising
[177] a family, her devoutly Christian behavior, her espousal of dominant White values, and, especially, her hearty good humor. She has never accepted the guilt of either her father or her sons, maintains that they were falsely accused, and has worked steadily to secure her one son's pardon.

[191] Grandma Williams was raised in a Klamath speaking household and acquired her English in school. She is very proud of her education and maintains that chil-
[871] dren today are not so well tutored in the 3 Rs as she was. She claims that "I can just about out-spell, out-write, and out-figure all of my kids." This is by
[593] no means the only aggressive, competitive attitude she maintains towards her children, none of whom have ever quite lived up to her standards. In this res-
[603] pect, Clifton was once able to witness her training a grandson, who was an alert,
[867] spontaneous, active lad. The boy was made to be too polite and too formal, behaviors in keeping perhaps with urban middle-class society, but very much out of place on the reservation. All of her sons have maintained their main affiliations with the local "cowboy" culture, but they are ridiculed for their efforts at riding and calf roping because of their obesity and clumsyness, none of them coming near, in physical type, to the slim hipped, pencil shaped cowboy ideal.
[657] She is an excellent example of a woman who, early in the reservation period, was carefully tutored by conscientious minister-teachers in inappropriate behaviors
[871] and values, and who has attempted to transmit these to her children. It would
[177] seem that she has produced over-trained, and mis-trained, hostile children, who promptly discovered that regardless of their veneer of "culture" they were rejected from many local circles because of their Indianness.

*159 Grandma is a direct, forceful person, another Klamath woman with a sharp wit
157 (yet a less personal one than Aunt May's). She is quick to initiate inter-
156 changes and to attempt to knit together a strained situation. Yet her responses

are marked by alternate periods of (brooding?) silence and she is more than a little pretentious, as for example her response to TAT card #1, "Oh, that's that famous European violinist...Levi Strauss." Her life has been characterized by many extremely stressful situations, but she does not seem easily discouraged, and maintains her vigor and independence. She tends to over justify herself, as if she had some doubt about certain of her characteristics, or as if she had strong feelings of uncertainty or inadequacy. This is in strong contrast to her leadership role in her family, and her domination of many social situations. She is also somewhat excitable and tends to directly express her emotions more than many other Klamath. 159* 157 [156]* [155] [156]

The working relationship with Grandma was one of the best. When she first learned the writer was an Anthropologist she warmed to him immediately and volunteered to take the tests. She was tested "on the job," at the top of a 200 foot fire lookout tower in the midst of the Klamath forest. 159* 124 [123]

Rorschach Interpretation

*159
157 The Rorschach reflects a woman who is extraordinarily preoccupied with disease (at = 10+5). If she is not physically ill, she is hypochondriacal and perhaps suffering from somatic delusions (at R; F+%, 52). She is likely to be very ill at ease in interpersonal relationships (M on Card II), probably because she is demanding of attention from others (C:CF:FC). I wonder if she doesn't use physical illness in order to be taken care of.

[156] The test results indicate that she views interpersonal relations as terrifying struggles in which she may be "demolished" by others. Since her only M in human content is "a couple of men testing their strength" and her Sum/C:Sum/c is 3.5:0, we would say this is how she acts in interpersonal relations at this time. She "tests her strength" — but cautiously. The figures are "in disguise," they are not to be trusted. In meeting people she has to decide whether she is strong enough to be safe, or whether they are so strong that they would harm her.

The FM, on the other hand, are aggressive "climbing up to demolish something," "germ attacking the lung," "bugs attacking throat." This is the enormous aggressiveness of which she is afraid, but it also indicates that she is capable of experiencing this kind of hostility toward others. Under stress or "in states of diminished consciousness" we may see some extremely aggressive behavior on her part.

Since I scored R20 as a pure C response and there are 2CF and no FC, we must conclude that S does become overly emotional at times. They may be "crying spells" or expressions of the anger indicated in the preceding paragraph which she is unable to control. I scored R8 and R12 as Fc' but they may be Fc. If they are Fc' they support the notion that our S has little control over her feelings. The great variability of her initial reaction times also bespeaks of sporadic impulsivity and feelings of anxiety.

*159
158 The more one thinks about it, the more pathological the picture becomes. F plus percent is only 52 despite the 6 populars; there is a positional response on Card IX; there are a few peculiar verbalizations, e.g., the vertebrae and brain being referred to as "the center of man's being" and "the main part of life and

Fidel: Male, Age 19

Background Data

*159
*156 Fidel's case is that of a young man in the process of separating himself from
his family, yet without any clear sense of where he wants to go. He has never
[461] worked at any job, although he quit school in the 10th grade, when he was sixteen.
Except for 8 months residence in the San Francisco area with his family, and five
[871] school years spent in a Catholic boarding school, he has never lived away from
the reservation. He is the third eldest of six children. He presently lives at
[592] home, if the household which contains himself, his parents, and his younger sib-
lings may be called that. As an unmarried minor approaching maturity, his tribal
[434] income is administered by a trust officer who allocates to Fidel $110.00 monthly
[657] for spending money. Additionally, Fidel sends bills for various expenses to the
bank, which pays them. These arrangements have been in force for three years.

[733] Fidel's mother is a somewhat confused, defeated, semi-alcoholic who is very
reserved when sober and gay and promiscuous when drunk. His father is a Skagit
[582] Indian who has for years been steadily employed as a cat skinner for a logging
[648] company, which work keeps him away from home for months at a time. During the
logging slack season, his father is only occasionally at home. He is usually
[221] away hunting or fishing. When he is at home he is frequently drunk, and when
drunk characteristically assaults his wife and berates his children. The father
does not contribute to the income, the up-keep, or the conduct of household
[593] affairs. In recent years Fidel has defended his mother and the children from his
father, on several occasions has driven him from the house, and on one occasion
knocked him cold with a rifle butt. There is some doubt as to whether this per-
[848] son is actually Fidel's father, the doubt being due to his mother's promiscuity,
which is of long standing, and to Fidel's almost total rejection of him. Fidel's
*159 relations with his father illustrate his marked and extensive ambivalence towards
156 most personal relationships. He will call him or refer to him as "father" or
593 "dad" and in the next breath "uncle," at one moment praise his skill at hunting,
and the next deride him. Fidel cannot fully accept any relationship; he exhibits
the same ambivalence towards his mother, his siblings, his closest friends, girls,
and so on. Moreover, Fidel cannot undertake any course of action without doubt
and reservations. He can neither love nor hate fully.

Fidel's family life is marked by a complete lack of cohesion, cooperation, common
[421] activity, and common property. The major shared sentiment is an indifference to
one another. Each member occupies a part of the house where he keeps his belongings, and these are rarely shared. For example, Clifton once needed a rifle for a hunting trip. It was borrowed directly from the father; Fidel could not borrow it for him. A major source of difficulty is intra-family theft, which engenders violent reactions. The mother is psychologically divorced from the father, and strongly oriented towards her eldest, married daughter with whom she spends much time.

*159 Fidel thinks of himself as a guide and skillful hunter, insofar as he thinks
156 of himself as anything. On several occasions he has been in trouble with the
law, usually for drag racing or drinking when a minor. He spends his time
[673] loafing about, watching TV, playing pool, fishing, hunting, visiting with his
buddies, and sleeping. He is seldom in bed before 1 AM, and equally seldom
[512] awake before two or three PM. His main ambition is to get out of the area, away
from his family, and off by himself. He has thought about studying art, which
may result from an identification with a friend who is doing so.

Fidel quit school because of what he defines as "family trouble," and this failure is probably equally due to his lack of support and training at home, as well as from the mildly hostile, indifferent posture he maintains. He expresses bitter contempt for his family, for the filthy house, for the lack of regular hours, and for the frequent squabbles. His isolation from this group is adequately measured by his lack of knowledge of the interests and affiliations of family members. His contempt for them is balanced by his father's derogatory, competitive attitude towards his son and his mother's indifference. Fidel stands thus, mildly hostile, ambivalent, and infinitely bored, at the brink of independent adulthood. 159* 156• 593 [871] 159* 157

Rorschach Interpretation

159*
157
[156]*

Three aspects of this Rorschach protocol stand out: the absence of color responses; the emphasis on movement (of his 14 scorable responses, 12 involved human or animal movement); and the nature of the movement response on Card VIII (R12): "He looks like he's got a grin — I mean a mean look on his face." The content of this movement response suggests that the subject is strongly ambivalent about his role in human relationships. His immediate response to an interpersonal situation is an open, friendly one, but for some reason he shifts to a more aggressive menacing role. It is as if he tries to conceal his immediately positive response to people behind a "mean look."

On the face of it, the absence of color responses seems incompatible with the hypothesis that this man is involved emotionally — either positively or negatively — with other people. However, when we note that the subject is not indifferent to the color aspects of the cards, the interpretation becomes not inconsistent, but richer. In response to Card II, for example, he states, "How come they put different colored ink in them?" The absence of color responses suggests not that the subject is uninterested in personal relationships, but that, since he is unable or unwilling to integrate the color aspects of the blot with the shape of the blot, he probably reacts to the emotional aspects of interpersonal relationships, but does not make the effort required to integrate his feelings with the demands of reality.

How are we to interpret the fact that of 14 responses the subject has 12 movement responses? We must conclude that he has a rich and extensive inner life; he probably gives much thought to the significance and meaning of a situation without giving any overt indication of this thought. The fact that he waits for the examiner to finish writing, for example, indicates that he is aware of what is going on around him.

Five of this subject's six human movement responses are of the guarded restraint variety: "two girls looking at each other," "a man standing there" and so on. His prototypal role, then, involves watchful waiting and a tendency to inhibit the expression of feeling; this inhibition has apparently generalized to a considerable extent (narrow range of content). Perhaps the most revealing response, though, is the frightening "bug with wings" on Card IV. There is a feeling of dark shock here; he tells us after 33 seconds that he doesn't know "what the heck this is." And, on the basis of the inquiry, "It's reaching for you or something" we would have to conclude that the subject is frightened by the aggression implied here.

On four of the cards — involving eight of his fourteen responses — the subject gives an identical response to the blot when seen upside down as when seen right side up: "That's the way it looks — both ways, upside down and the other way." Although this mode of response does occur on occasion, rarely does it assume

#159 157 the proportions it does in this case. What is the meaning of it? There seem to be two general kinds of explanations possible. The first involves the notion that the subject's perception is generally vague, so that the specific requirements of the blot are of little importance. He gives the response largely based on internal needs, so it matters little which way he holds the blot.

The second possibility suggests that the subject is indecisive; he can't make up his mind. He isn't able to decide which end is up. These two possibilities are not at all exclusive and there is reason to believe that both are involved (e.g., he can't decide on the sex of the figures in R4; his responses are not well delineated; and on two cards he never does make up his mind).

The most disturbing aspect of the protocol, however, is R13: "something with a fish coming out of its head." This is at least a fabulized combination and as such indicates a looseness of associative processes — a disorder of thinking. The fact that he gives it without comment and that it appears in a relatively brief record makes it more ominous. It suggests strongly that this man is not always able to control his thinking and that he may come to unrealistic conclusions based on very slim evidence.

Since there is not much evidence of strong feelings, however, there seems to be no reason to think that the subject will act in a peculiar fashion. He may have some strange ideas, but they are not likely to influence his behavior very much.
156 The protocol suggests that this man actually tries to do very little. Because of his fear and distrust of others, he tries to hide from them — possibly behind a somewhat belligerent facade.

Lily: Female, Age 15

Background Data

Lily is an attractive young high school freshman. She is now repeating her 159* 156●
freshman year, due to various difficulties the year before. One of these involved her cursing the principal, for which she was temporarily expelled, to [873]
be returned by her mother the next day. She spent the rest of the year in
silent rebellion. This incident is not too serious, for more than anything [561)
else it indicates the strength of her attachment to a close-knit girls peer-group which is slightly wild and which makes it a matter of honor to oppose
adults. There is little additional evidence of any serious hostility or rebelliousness. Lily is the eldest of two children; she has an elder half-sister,
her mother's illegitimate daughter; and she has lived all of her life on the
reservation.

Lily's major activities and concerns are those of a typical, small town teen-age girl. She attends school, "hangs around" a local teen age center, flirts [883]
with the boys — White and Indian, dances — at her home or the home of a friend,
and listens to records. She comes from one of the most stable families on the
reservation. Her mother is Klamath, a grade school graduate who worked her way [874]
through two years of business school, evenings, in a nearby city. Her mother in
recent years has begun to assume a position of leadership in certain community
activities, particularly recreation and education. Additionally, she has for [571]
long been the advisor for numerous relatives. Her mother verbalizes great fear
and anxiety associated with this "getting out" and has done so only under considerable external pressure. Her father is a California Indian who is the model [177]
of local White conceptions of masculinity. That is, he is vigorous and physically powerful, a hard, reliable, steady worker in a logging company, a hard [464]
"Saturday Night" style drinker, absolutely fearless, and a masterful fighter
in brawls. His fights are the focus of several local folk anecdotes, and suggest [157]
his excellent reputation, for he protects the underdog, takes on the bully (by
the half-dozen, if necessary), neatly dispatches all and never bears a grudge.

Lily is a more flexible and less submissive person that she would seem on first 159*
acquaintance. The difficulty with knowing her is that she wears a completely 157
impassive, rigid, unexpressive mask before all. One morning after knowing her
for a year the writer walked by her and then stopped, mildly startled, for Lily
had smiled (slightly) and mumbled "Good Morning" under her breath. She is also [123)
less inhibited than this mask of impassivity would suggest, as is evident from
her behavior with her peers and parents, but in all instances she prefers to
communicate with slight gestures and to make do with very few words. She is,
in fact, a remarkably self-possessed, poised, and reserved adolescent girl, a
consequence of which is that she is far more graceful than many other local girls
her own age. But, generally, her responses only minimally involve her with 159*
others. She is always among people, but not always with them. Her reserve does 156
not dissipate much with continued acquaintance, but is a constant feature of her
mode of adjusting to others. She never talks freely and her terse responses to
the blots and TAT cards are paralleled by an equal economy in all personal relationships. There is no evidence to suggest that she is suspicious or distrustful of others, although she can be quite persistent in avoiding people she does
not like.

VIII Continued 159*

It LL brush. (Fire?) This bottom part. (Bottom pink & orange) () The color didn't 125 help for the fire. () Down in my Dad's tribe they're medicine men. They go out in the hills and stand over a fire and sing and it's supposed to get whoever they sing for well. (11) Both side pink, D57. Just LL a bear climbing up a hill or something. Here's his front legs, and his rear ones, his ears and his face.

Rorschach Interpretation

159*
157
[156]

This adolescent girl — for whom "a smile is rare" — appears to be an intense, introspective person: movement is involved in eight of her thirteen responses. But there is insufficient responsiveness to external stimuli (no color responses with the possible exception of R10) and too much of her fantasy appears morbid or at least phobic ("Dracula" on Card IV and "monster" on Card X). Is she really this terrified of authority? The test suggests "yes," but that she won't admit it readily.

*159

157 There are no indications of peculiar thinking or intellectual impairment, but the total absence of color responses does reflect a poverty of emotional responsiveness. She appears to be a laconic, taciturn youngster. Her free associations are stated briefly and not spontaneously elaborated.

157 156 [154] The Rorschach gives us, then, the picture of a stereotyped, overly conventional adjustment. She is a "good" girl who does what she is told and uses her fantasy to gain the little instinctual gratification she gets. The fact that her smile comes as she is describing "teenagers dancing" suggests that, like most youngsters her age, peer relationships are particularly important to her and that this is not an area of particular threat. It is probably the male authority figure who is her difficulty.

*159

156 177 [121] This protocol contains the first overt comment concerning an acculturation process. One can perceive her distance from her father in her discussion of R10: "...it's supposed to get whoever they sing for well." Her objectivity here indicates that she is a part of the generation which is undergoing acculturation. She can apparently look, with distance, at her father's tribe's customs. One wonders to what extent this cultural change is a factor in her difficult relations with her father, or whether — with Freud — it's the "universal Oedipus complex" we see here.

[121] This is a conventional record to the point of constriction: 5 or 6P; F plus percent adequate; several M; no major shocks. Only the absence of color responses stands out. We are left with the question of how and why this youngster has buried her feelings so completely? Although this is a brief record, we hazard the guess that it is the stress of acculturation which has created the overcontrol which characterizes this girl's adjustment (R10).

Section IV. Summary and Conclusions

In concluding this report rather than to attempt a detailed synthesis of all 121
aspects of the preceding case studies we intend to pursue some of the implications of certain striking characteristics of Klamath personalities. Aside from this descriptive effort we also intend to derive, hypothetically, an association between these personality attributes and Klamath acculturation experiences.

Certainly the most pervasively shared attribute of Klamath personalities is the 156
one we have chosen to call guarded restraint. This label is intended to desig- 157
nate the general attitude towards self and interpersonal relationships which has
emerged from the analysis of Rorschach records, life-history materials, and ob- [12]
servations of behavior. Guarded restraint, therefore, may be taken to mean the prevalent suspicious and guarded attitude towards life of the Klamath subjects, their wariness as regards significant others, and their apprehensions as regards their environment generally. This attribute, as we conceive it, has many facets. It includes an unconscious as well as a more deliberate muting of responsiveness to the actions and the mere presence of others, a shallow, non-committal attitude towards membership in various social groups and the goals of these groups, and a characteristic which ranges from simple lack of trust to outright fear of the behavioral milieu.

Stated in largely psycho-dynamic terms the notion of guarded restraint may seem 121
somewhat ambiguous. The empirical referents on the level of observable behavior are, however, highly visible. They may be observed in a wide variety of behavior settings, from the informal and unstructured relations within a teen-age clique or an adult drinking group to the more organized setting of the family and household.

The psycho-cultural phenomena we have labeled as guarded restraint over-laps 121
with what others have called Klamath individualism. Seen in this perspective, 157
we may, perhaps, introduce a somewhat richer way of analyzing and gaining insight into the nuances of Klamath behavioral styles. This approach is, we hope, something more than just a different way of looking at the manifest separatism and incohesiveness of family groups, a more fruitful manner of examining the atomistic structure of Klamath reservation sodalities, and a means of appreciating the psycho-dynamic causation of the constant fractionation of Klamath political
groupings. The evidence of these case studies, then, suggests that few Klamath [156]
are capable of fully identifying with other persons or of committing their loyalties to concerted group action.

We feel that this major descriptive conclusion is, in large part, a product of 125
the case study method used in analyzing the Rorschachs. Moreover, it is our 128
belief that this conclusion could not have been obtained from an analysis of a composite psychogram based on formal scores. As anyone who has ever read reports based upon the statistical or modal personality approach well knows, such reports are ridden with dynamic cliches and are largely sterile until filled out with examples of the qualitative features of individual records. In this report Levine has entirely discarded the lumping of group scores and concentrated upon an analysis of qualitative features of individual records buttressed and supported by the use of formal scores and relationships. The importance of this approach
is shown by the fact that the reserve and guardedness that characterizes Klamath [157]
does not always show up in individual test records in the same form. Most frequently an important clue is had from the presence of restrained, watchful, wary figures in human and animal movement responses. Indeed, this type of movement

125 128 [157] [124] response provided some of the first clues as regards this important personality attribute (Clifton 1960). But other test evidence, as well as life history and observational data, leads to the same conclusion, regardless of the presence or absence of a restrained movement response.

157 156 [125] One facet of Klamath guardedness and restraint is the general reluctance of Klamath individuals to reveal or communicate to others their needs, wishes, interests, or concerns. This may, in part, be seen as a function of suspicion, of fearful concern with the possible reactions of others, but another characteristic of Klamath persons may be associated with this reserve. The reference here is to a general, overt, and conscious devaluation of the self. The Klamath seldom have much good and often much that is bad to say of themselves. Although this characteristic is not directly manifested in the Rorschach records, these records do indicate the presence of multiple and conflicting, or unacceptable prototypal roles.

Another aspect of Klamath guardedness seems to be a precipitate of the very high investment of energies in sheer self-protecting maneuvers, and the time spent in the avoidance of entangling committments to group life. We feel that the Klamath have so over-invested in reserve and self-protection that they have little time or energy to expend on other activities or upon other aspects of their situation. This, we feel, may be responsible for another shared component of Klamath character, their inability in laying plans for the future, and the minimal expenditure upon creative effort. By way of contrast, the Klamath do concentrate upon the superficially rewarding or painful aspects of their current situation.

121 156 155 657 [171] [158] The analysis so far points to a general isolation of Klamath individuals from significant, durable human associations. Given the facts of Klamath reservation culture we consider that this characteristic is probably adaptive, although it might not seem so if measured against an ideal model of mental health based upon the functioning of west European, urban, middle-class persons. Considering the realities of the Klamath situation, guarded restraint in itself may hardly be considered as pathological. Yet so great a reserve and so extensive an insulation of the self from important human transactions may be a major source of stress and may predispose Klamath individuals to variant forms of mental illnesses.

157 158 [121] Several of the cases contained in this report provide evidence for this hypothesis. In the instance of Slim, for example, we find that a superficially adequate adjustment may simply be the manifestation of an obsessive control over and reduction of emotional and intellectual processes to the point of a tentative diagnosis of alpha schizophrenia. The cases of Susan, Nell, Fidel and Sparrow are examples of extremely loose, unrealistic and disorganized thinking with overtones, in some instances, of an almost paranoid suspiciousness, or a reliance upon bizarre, highly personal fantasy. Evidence for a well defined idiosyncratic role or personna which is very poorly integrated with the rest of the personality is seen in the cases of Slim's false optimism, Carrie's brashness, and Aunt May's superficial warmth. We suggest that these more disordered aspects of adjustment may profitably be seen, in part, as a function of a generally poor contact with others, reduced insight into the self and others, and extensive social isolation. The mediating difficulty may well be a relative absence of opportunities to validate beliefs and convictions. Thus in many respects adaptive, Klamath guarded restraint probably serves as a precipitating factor in thinking disorders, sociopathic adaptations, alpha schizophrenia, and paranoid delusions.

128 127 The validity of this assessment does not depend upon these ten case studies alone. Very similar if more limited conclusions were obtained in a previous, independent

analysis of 53 Klamath Rorschachs and 33 Thematic Apperception Tests, with 128
additional evidence derived from participant observation and life history data [127]
(Clifton 1960). Moreover, the assessment agrees, in large part, with the observations and conclusions of other field workers working independently. The significant point is that Levine, working blind from records of persons he has never observed has reinforced and expanded upon previous evaluations of Klamath character.

A second hypothesis about the Klamath which arises from our study — an hypothesis 121
of which we are less certain when compared with the observation that they are
a people who may be viewed as guarded and restrained — is the finding that "in 157
the total kin network the influence of the male is weak..." and "whether or not 562
there is a male attached to the household group, the wife-mother is usually the
power figure." This finding, based on the anthropological data, is theoreti- [156]•
cally congruent, almost startlingly so, with the fact that the more imaginative, creative, rich — healthy, if you will — Klamath Rorschach records were produced by the women in the sample, while the men's records were typically stereotyped
and constricted, and often unrealistic, disorganized or suspicious. The statis- [127]
tical comparisons (Clifton 1960) as well as the individual Rorschach analysis
(Chapter III) convey this impression very clearly. [128]

The importance of these findings can be viewed profitably in the light of con- 121
temporary psychoanalytic theory, especially in relation to the concepts of identification and modeling in child development. The theory holds that the child identifies with, i.e., adapts the characteristics, attitudes, and values, of his parents because he envies them; they are the powerful people who receive the rewards and gratifications which he is denied. In classical psychoanalytic theory, the boy is said to identify with the father because the father is the power figure in the family and receives the love of the mother. Although Freud never was as content with his psychology of women as he was with the Oedipus Complex, pre-
sumably similar processes account for feminine psychology. The classical Oedipus [128]
Complex has been modified in order to integrate more satisfactorily with cross-cultural data, and it is in this more flexible framework that the present results can be understood best.

In those societies in which the father is not a stable, respected member of the 121
family the process of identification is not as straightforward: the growing boy does not want to be like his weak father; he cannot identify with an absent father figure; yet he is biologically unable to be like his mother. The theory holds that his identification as a person will not be well integrated or complete.
In the Klamath family, the mother is the stable figure, the one who commands the 121
boy's respect. Since a consistent and integrated identification is needed for a
healthy development of the ego, we are not surprised to find that the males in 156
our Klamath sample show signs of poor ego structure. The women, on the other 562
hand, come off much better and one may hypothesize that they are able to make a
more integrated identification with the wife-mother figure in the Klamath family. 593

It may be necessary for a well-stated theoretical position to distinguish between 121
two qualities of the parent which are confounded in the present discussion: stability of the model on the one hand and the extent to which the parent receives rewards, on the other. The general theoretical position, however, states that those societies in which the father is more stable, receives more of the respect and material reward, or is more powerful will be societies in which the boys can
establish their roles more readily. On the other hand, in groups like the Klamath, 121
in which the father is weak or absent, we can expect to see signs of role conflict, 156

562
593

121
156 vague identification and, since it is largely through identification that the
562 super-ego is established, weak super-egos.

593 It has been suggested that what we have called guarded restraint may be a "front"
121 maintained only when Klamath are interacting with whites. The point is that
156 guarded restraint may be another name for the extreme suspicion and reserve of
many enclaved or colonized minority groups vis-a-vis representatives of the
177 dominant culture (Underhill 1960). It cannot be denied that, in fact, reserve
[171] and suspicion do characterize much of the relationship between Klamath and Whites,
but the reserve and restraint which so characterize Klamath persons is not solely
a function of such situations. We agree that guarded restraint is one important
consequence of acculturative contacts, but the evidence of observation and life
histories clearly indicate that this is a personality attribute manifest in many
[829] situations exclusive of the presence of outsiders. Life history subjects, for
example, speak of the "Indianness" of their parents, meaning precisely an aloof,
reserved style of interaction. Many other informants verbalize reactions to the
endemic if latent suspiciousness of Klamath life. Thus guarded restraint is not
purely an observer construct with a referent limited to the test situation. Certainly, a measure of reserve and suspicion may serve utilitarian functions when
interacting with strangers, but the same characteristic makes strangers out of
neighbors.

121 Underhill's suggestion does raise the issue of a broader connection between
156 guarded restraint and the impact of acculturation. If there is such an association then we should expect to find these attributes widely distributed among
177 other acculturated populations, especially those which have been exposed to the
171 imposition of external political and administrative controls, and deculturation
or detribalization. That there may be some validity to this hypothesis is sugges-
157 ted by the fact that attempts to communicate our findings to observers with experience among other acculturated populations frequently evoke memories of similarity in character. What we have called guarded restraint has been suggested as characteristic of the contemporary Southern Ute (Stewart 1961) and especially the Mountain or Towoac Ute (Canan 1961), and of the Cree, Northern Athabascan, and Eskimo (Heinrich 1961). In each instance there are differences, but differences which seem to play upon a common theme.

Personality attributes analogous to what we have called guarded restraint have repeatedly been discerned among other more or less acculturated North American Indian populations. Thus Barnouw describes the Wisconsin Chippewa as emotionally isolated, suspicious of outsiders, and fearful of expressing emotions overtly (Barnouw 1950: 22-23). Klopfer's analysis of Chippewa Rorschachs suggests that "...the individual is under pressure to become as emotionally independent of his environment as possible, and to expect very little from others." (Barnouw 1950: 27). The Ojibwa have been described as emotionally restrained, suspicious, and anxious (Hallowell 1955: 350). Hallowell's interpretation of these characteristics is that they constitute persistent aboriginal components of Ojibwa character structure. In a similar fashion, the Native-Oriented Menomini have been described by Spindler as a group characterized by a non-defensive reduction of emotional display, whose perception is narrowed to only a very selective portion of their environment, and who are further characterized by a non-manipulatory passivity. Outside of the presumed character structure of the Eastern Woodlands, the most widely distributed "aboriginal" characteristics of North American Indians, generally, are given by the Spindlers as non-demonstrative emotionality, great reserve, individual autonomy, and a generalized fear of the world as dangerous (Spindler and Spindler 1957: 148).

On the face of these parallel descriptions it would seem that the Klamath are 121
similar, as regards guarded restraint, to a variety of differently situated, 156
differentially acculturated North American Indian populations, populations with
diverse cultural heritages. These similarities are, of course, susceptible to 157
different explanations. It would be a simple matter, for example, to explain 171
away the similarities as false, that is, as being a function of unreliable tech- 177
niques of assessment and highly ambiguous descriptive constructs or constructs
lacking in validity. Aside from being no explanation at all, this approach would [114]
involve discarding most of the available cross-cultural psychological data as
well as existing assessments of the personality dynamics of North American Indians.
Although this is the course advocated by many methodological puritans in the area
of culture and personality research we choose to accept the similarities as valid.

A second way of explaining these similarities might invoke the assumption of an
underlying "North American Indian" character structure or basic personality ana-
logous to Devereux's delineation of a core personality type for the Plains
(Devereux 1951). Accepting this assumption the persistence of core traits must
then somehow be accounted for. In the instance of the Plains, Devereux presents
one possibility, namely that acculturation has resulted in a "stripped-down"
and impoverished personality type (Devereux 1951: 25). Somewhat differently,
Hallowell and his followers have argued that basic personality somehow manages
to weather the vicissitudes of history and acculturation (Hallowell 1955: 309;
Spindler 1955: 151). The common feature of both of these explanations is the [114]
assumption of an underlying, basic set of psychological characteristics linked
to aboriginal prototypes and common to the population occupying a given culture
area.

In the instance of the Klamath there is very little evidence to suggest, un- 121
equivocally, that guarded restraint was a dominant component of aboriginal char- 156
acter structure. The information is scanty and points to the definite presence
of great reserve and considerable suspicion, but only as one mode of interper- 157
sonal relations among others. Moreover, the Klamath reservation situation does 177
not allow a comparison of differentially acculturated groups after the model
used by Hallowell for the Ojibwa, and the effort to apply Spindler's technique [657]
of an internal comparison raised more problems than it resolved in this setting.
Finally, the evidence from the Klamath psychological data indicates that, if [171]
anything, older members of the tribe are less reserved and suspicious. In short,
we cannot assert from available evidence that guarded restraint was basic or
dominant in aboriginal Klamath character structure. We suggest that at minimum
this characteristic was present, but that it did not receive the emphasis it
now gets.

Aside from this difficulty, there are a great many conceptual problems associated 121
with the postulation of an underlying, basic trait of guarded restraint for the 156
North American Indians generally. We feel that it is stretching the point to
attempt to account for present similarities among unrelated cultures of such 157
different cultural heritages with a construct so broad. Due to the absence of 171
firm measures of aboriginal character structure this approach to explanation also
involves substantial methodological problems which are not easily resolved.

Instead of explaining contemporary similarities in either of these ways it is 121
possible to view modern Indian populations in the light of common acculturative
experiences and their status as dependent wards, as enclaved minority groups, 156
and as persons who have been promised much but who have attained little. Spindler 157
has suggested that when acculturation conditions permit both a ready identification 171
177

121 with the values of the dominant culture and provide access to the institutiona-
156 lized means of attaining desired goals there will be a successful psychological
157 adaptation to dominant standards, but that when these conditions do not exist
171 then there may be overt change in the content of culture unaccompanied by changes
in psychological characteristics (Spindler 1955: 199). In the same way, Hallo-
177 well suggests that constant association with powerful external agents, multiple
conflicting sources of reward and punishment and the ridicule and invidious com-
parisons which too frequently accompany acculturation situations may result in
extreme feelings of insecurity, personality maladjustment, and what he calls the
"frustration of maturity" (Hallowell 1955: 329).

Spindler's dual hypotheses are, of course, not the only alternative consequences of acculturation situations. We feel that between these polarities there are different modes of adaptation open, modes similar to those suggested by Hallowell. [178] We therefore assert, hypothetically, that the defensive, guarded, reserved style of interaction now characteristic of the Klamath is the product of the deterioration and decay of major patterns of aboriginal Klamath culture, a prolonged exposure to and considerable identification with the values and standards of the dominant White society, and the persistent denial of access to the means and instrumentalities necessary to achieve these goals and to live up to the standards. We argue, in this way, that there are a great many similarities between diverse American Indian populations as noted by many observers, that these similarities do not constitute the residue of generic Indian character traits, but that they are a function of a common depressed minority group status within contemporary American society. Our analysis of this is that these components, specifically, the guardedness, the reserve, the suspicion, and the lack of involvement in creative group activity, are very much analogous to what various sociologists speak of as alienation or anomie (Merton 1957: 121-194; Nettler 1957; Seeman 1961).

Conspicuous Features

(1) low W
(2) high Sum/c
(3) high d

Rorschach Interpretation

159*
157•

The few W, the emphasis on shading, and the large number of d highlight this man's approach to life. He is concerned about minute details and subtle nuances, but relatively neglectful of general considerations or extensive plans for the future. This is both his strength and his weakness. He talks about his "drawing" and comments "I could make a good drawing out of that," but he does not have the motivation, ambition, perseverance, or overall organization which a successful artistic creation requires. He may act the part of an artist, but it is doubtful if he is actually very productive or creative.

On the other hand, this attention to detail enables him to react sensitively and probably with tact in interpersonal relations. He is careful and likely to be concerned with the feelings of others. He rarely acts inappropriately or inconsiderately and, with his above average intelligence, may be relatively successful in life.

The low W and the Sum/c greater than Sum/C would, in a white American, suggest the pattern of the "alpha schizophrenic." Piotrowski's concept of the "alpha schizophrenic" is based on the hypothesis that some people do not manifest overt

159 psychotic symptoms, despite serious emotional disturbance, "because they control,
157 or have reduced, the intensity of their emotional and intellectual processes to such a degree as to produce hardly any specific and easily recognizable schizophrenic symptoms." Their "capacity for energy control (shading) exceeds their capacity for energy output (color)" (Piotrowski & Levine 1959: 223). Thus, having expended all their energy on controlling their behavior and feelings, they are left with little energy for constructive effort and planning (low W).

[171] This pattern may reflect a pathological adjustment in a white American whose culture demands long range planning and constructive effort. In the Klamath
[154] group, however, this emphasis on day-to-day pleasures and consideration for others may be more acceptable than the long range planning and self-aggrandizing behavior which is reportedly becoming the acceptable pattern in American suburbia. If this is true, this subject's adjustment may be perfectly fitted to his environment.

There is, however, additional, independent support for this description of this subject's personality. His preoccupation with the inner details (R2, R4, R24) indicate an approach to life characterized by over-cautiousness —almost suspiciousness — a peering into the situation, rather than an acceptance of it at face value. At the start of the test, he apparently requests clarification of the instructions. The analysis of the movement responses also will support this interpretation.

Despite the verbosity there is actually very little of this man's inner life reflected in this protocol. Rather than reveal himself, the S analyzes the subtle nuances of what is going on around him. He is like the "cat" on Card VIII, "he's watching something...I've no idea (what he's watching)...just watching...". The number of faces and the emphasis on "eyes" (especially the "dark beady eye" on Card IX) are also consistent with the interpretation that we are dealing with a suspicious person — he doesn't trust anyone very far. So all his energy (the little he has) is concentrated on analyzing the possible dangers in any situation, not viewing the situation for all the positive possibilities it offers.

His pace is generally even except for delays to Card IV and VI, the darkest, most ominous of the blots. Is he disorganized by the depressive implications
[154] of these stimuli? If so, we would conclude that he tries to deny the gloomy aspects of life. The sun on Card II is "coming up," not going down and there is a kind of exuberance in his response to Card X. One wonders if he isn't trying to act the part of an optimist, despite occasional qualms about this position.

The only human movement response in the record is R6: "a caricature of two people" and on the inquiry, in response to a question, "I guess they're dancing - jitterbugging I guess you'd call it." The movement was very slow in being verbalized, it was dehumanized (they are caricatures, not real) and it is stereotyped. As such, it probably does not reveal much of this man's conception of his role in
[156] life. Unless perhaps it means that he does not have a well-delineated prototypal role.

The FM, on the other hand, seem to reflect a more consistent image. R10 and R15 (the dog "looking straight at you" and the "watching bobcat") are both scorable as "guarded restraint" responses and indicate that this man's cautiousness, his "watchful waiting" have been past roles and are likely to appear in states of diminished control. He is not guilty or anxious about behaving in this manner.

The few M's, the rejection of Card VII, the long IRT to Card VI, and the great 159*
distance involved in his percept on Card VI point to some difficulties in his 157●
heterosexual adjustment, the precise nature of which cannot be determined.

In summary, this man's reality contact is unimpaired; he has no thinking disorder; he is not psychotic. There is only the remnants of an intelligent, artistic person utilizing his energy to maintain an adequate adjustment to a difficult situation, to continue his interpersonal relationships in a moderately satisfactory manner, and to protect himself from too painful self-awareness.

Susan: Female, Age 24

Background Data

156
*159 Unlike Slim, Susan is not so well liked or respected. The occasion for this is
specific, an unsanctioned pregnancy during her last year in high school and a
[848] more recent marriage to an entirely disreputable Mexican from Utah. This com-
munity evaluation is accentuated because of the very high respect in which her
[582] own family is held. Everyone expected better of Susan.

[626] Susan has worked as a dishwasher in several cafeterias, both on and off the
*159 reservation, and moved to Utah so as to take a practical nursing course. She
found this training uncongenial, met and married her husband, and they returned
[464] to the reservation when his small business failed. Susan is a high school graduate.

[874] Susan's mode of selecting a husband parallels that of her mother, who met her
husband while hospitalized in New Mexico. Her father by birth is an Apache
*159 Indian, and by cultural affiliation a southwestern United States Spanish-American.
593 Without doubt, he is the most autocratic, stern, demanding, rigid adult male on
the reservation. Although a married woman with children of her own, Susan must
ask her father's permission to use the telephone or to walk downtown. Her mother
was Klamath and very well respected for her stable family life and for her active
participation in many community activities. Susan was extremely close to her
mother until her unexpected death several years ago. They were known as an in-
separable pair and her mother never went out of the house without her. The
mother's death was, perhaps, the major cause of Susan's failure to complete her
nurse's training. Susan's illegitimate pregnancy in high school was a consider-
able shock to her mother and is, with her marriage, a continuing source of strain
[155] with her father. Susan evidently feels that her behavior was a contributing
cause for her mother's death. She made a death-bed promise to her mother that
she would not be a loose girl and that she would marry and stay married to one
man. It was shortly thereafter that she married and returned to the reservation
to live with her father. There is much strain within this household, derived
from the relations between father and son-in-law, and from Susan's unsuccessful
efforts to serve two masters, for along with her marital relationship she evi-
[626] dently was trying to act as a replacement for her deceased mother's role. At the
same time her conduct has alienated her from the church, from family friends,
and from the community.

*159 The contact with Susan was made via her father, who told her that she should
[124] cooperate. Her father's motivation in this was not, as may be supposed, the con-
viction that she needed testing because something was wrong with her, but in-
[123] volved a more general sentiment. He felt somewhat honored to have an "educated
man" visit his house and that such a contact was a good experience for his chil-
[593] dren. Susan accepted this like an obedient, dutiful daughter. She came readily,
with no indication of unwillingness, and relations with her were quite good,
perhaps because of the strains of her marginal position and her need to talk
with someone.

*159 Susan seemed an apathetic person whose feelings were dulled. If anything, her
reactions were those of an over-trained, too obedient child. She was not very
•157 responsive or active, and would seldom talk except to answer a direct question.
Then she would, frequently with evident pain and anxiety, describe her feelings
and situations tersely and haltingly. Susan clearly wants more than her life
now gives her, but cannot define her present conflicts or see her way clear to

159* 157● [152]

their resolution. Just as clearly, she is extremely discouraged and demoralized. During the course of testing and questioning she was manifestly anxious from time to time, this being evident from a slight stammer, frequent parapraxes, and a tendency to over correct for errors. To the blank TAT card, #16, she told a story of a girl's reaction to the death of her mother and then cried painfully, trying to control herself.

Rorschach Interpretation

159*
157

This is a rich and complex Rorschach protocol and reflects a subtle adjustment to life. Not only does the subject give 6 good quality M, 9 well organized W, Sum/C = 2.5 and Sum/c = 2, but many of her responses are highly integrated and she often utilizes blends of determinants. She has more M than FM and more FC than CF. Thus the test indicates that she is an intelligent, sensitive person who is making an active and appropriate adjustment to life.

She gives an adequate number of responses and, although her approach emphasizes W, her W attempts are usually successful. The occasional slip in organization

*159 (e.g., on Card VIII: "pink bears hanging onto a guy's hat" and "women shooting
●157 sea horses" on Card X) indicate that she may be occasionally loose in her thinking, over-sensitive, and wrong in her interpretations of motives of other people. However, the overall richness, originality and subtlety of the record — along with five popular responses, suggests that she functions more than adequately in most social situations. There is a possibility that her F plus percent is lower than would be consistent with this conclusion, but a careful inspection of the four F minus and one M minus indicate that these are borderline in quality, not really poor.

The most conspicuous feature of the record is the emphasis on movement: her "experience type" is 6:2.5 and there are 3 FM and 2 m responses. Thus, of her 26 responses 11 involve movement; in almost one half of her responses she contributes something to the response which is not in the blot itself. This indicates the characteristic tendency of the imaginative person. She has that life within her which is independent of outer experience. Because of the 9W and Sum/C=2.5, this imaginative life is more than daydreaming; she is able to accomplish something tangible as well.

The content of her responses, however, suggests that what she accomplishes may not always be completely productive or creative; there is too much fear and aggression. The presence of m support this notion. Her very first responses strikes the aggression-fear chord which resounds through the record and probably occupies her thoughts and dreams: ..."a ...fiction vampire...his hands up in the air ready to pounce on you...". Only somewhat less terrifying is "the old fiction monster" on Card IV. We must postulate the presence of a stern punitive parent figure — more likely the father than the mother.

There are, however, plenty of aggressive women in the record as well: on Card X "...women shooting guns at...sea horses" and on Card VII "...a woman walking right down the middle and the two big figures...are running away from her." It is this latter response which reflects the subtlety of this girl's imaginative life, and the flexibility of her adjustment. She seems to be able to experience both the role of the figure whose presence frightens others as well as the role of the frightened one who runs away. This raises the question as to whether the subject is identifying with the aggressor or the victim. It is probably only rarely that the subject identifies solely as one or the other. People who conceptualize the world as a place where one hurts others probably also are able to identify as victims. In fact, one might hypothesize that the extent to which one cannot assume either role constitutes — to that extent — a rigidity of adjustment.

In the present case, there seems to be little difficulty. She can be either an aggressor or a victim, although in terms of number of aggressive vs. victimized responses, we could conclude that she is more psychologically at ease in the role of the aggressor. The likelihood of such overt aggression is very slim. The fact that the aggression appears in M responses, not color responses; the presence of shading; the postural M on Card I; the blocked M on Card III — all these factors reflect appropriate control mechanisms. This assertiveness suggests that the S assumes a dominant role in interpersonal relations. She gives women a "gun" in R24. Is she dissatisfied with the feminine role? Can we postulate the existence of penis envy in this woman? Possibly. But once again these conflicts are well controlled.

It may be that the tension created by this control of her strong aggressive needs constitutes the cause of the occasional lapse of adequate thinking noted in the "pink bear" response to Card VIII. However, the abundant formal indications of good adjustment must be kept in mind: the M: FM: m and the FC: CF: C ratios are all in the direction of "good" adjustment (6:4:2 and 3:1:0 respectively). 159* 157

In a record of this richness there are always a few responses which tease the interpreter because they promise so much and yet somehow their meaning remains elusive. Here I note R5 "...a couple of pieces of rope that's starting to burn... looks like the way fire usually flames up...a good start...burning." This is an original and is scored mC. Piotrowski's principle states that the m reflect "prototypal roles in life which the individual feels to be desirable and pleasant but unrealizable..." (Piotrowski 1957: 210). Can the "burning rope" response be interpreted as indicating that the subject feels it would be pleasant and desirable to "burn up"? Is she using "burn up" in the colloquial sense of experiencing fully and completely a feeling of anger? It would be consistent with our previous statements about her aggressive needs which are not being expressed. She would like to let herself get "burned up" at somebody, but she does not allow herself to.

We have a record, then, of an intelligent young lady who is utilizing her intellect and energy to deal with underlying feelings of tension and aggressiveness. Her major mechanisms appear to be the use of fantasy and intellectualization. [154] She is often tense and anxious, but she is able to deal with these feelings in an appropriate manner.

(7) Sum/c'

Rorschach Interpretation

In reading this Rorschach protocol, one gets the impression of a gregarious, effervescent, kindly, but ineffectual elderly man. He lives in the past and the future, but not in the present. He probably is unable to deal with the mundane issues of his present reality situation so he concentrates on his past experiences or his future plans. This characteristic trait is reflected in the de-emphasis of D responses and his over-emphasis on vague and undifferentiated whole responses. 159* 157● [154]

His emotional effervescence is reflected in the low F% (20%) and high Sum/C (6). His responses to the test tend to be largely of an emotional nature: shading, color, movement; they are not based on a cold intellectual, rational analysis of the blots. And so his life adjustment would be of this nature, i.e., determined largely by his feelings at any one moment.

One must consider seriously the possibility that this lack of intellectual control bespeaks of a serious psychological disorder --whether it be of an organic or functional nature. Is his response to Card IX a contamination, for example, "it's the shape of Australia and the green suggests grass. It's the color of an island." What is meant by the "color" of an island? To what extent have 157 125

157 125 the characteristics of the blot been organized intellectually and to what extent is he unable to accomplish this analysis? If he cannot accomplish this, there is a disorder of thinking present. Also, his response to Card II: the whole looks like an island, and the red looks like fire, therefore it looks like "fire on an island." At best it is a fabulized combination; at worst it is a contamination. Only a blatant schizophrenic would have gone to the pathological extreme and said "Fire Island." In addition there are no movement responses, there are only three popular responses and the F plus percent is only 56. Where are the control factors? The sum of color responses is 6; the sum of dark shading responses is 5; and there are not the indications of sufficient controls for this amount of emotional energy.

157 153 On the other hand, there are a few responses which suggest that his intellectual ability has been greater than average. His knowledge of the word "obsidian," for example, bespeaks this ability,[1] as does the nature, although perhaps not the feasibility, of his "plans." This is not inconsistent with the statements made previously, but it does suggest a situation marked by increasingly greater interference with intellectual functioning.

157 x159 The absence of any human responses in his Rorschach suggests his lack of concern with genuine interpersonal relationships; all his talk of future plans and business suggests that he is interested in using people for his own gain rather than in having meaningful and warm interpersonal relationships. His reaction times are quick, supporting the notion that he is likely to act in an impulsive manner. Two of his FM (R2, R7) are "flying," reflecting perhaps his tendency to try to escape from the present situation in an unrealistic manner. His other FM response (R1) may be an indication of his view of human relations: aggressive, cold-blooded, eat or be eaten.

158 In summary, then, the test reflects an elderly man, whose intellectual and emotional control appear inadequate. One wonders about the possibility of this man having been a chronic alcoholic and now suffering the effects of diffuse organic brain damage. He "talks big" but he probably doesn't "deliver the goods." There are indications that at one time in his life he may have had better than average intellectual ability and now is going downhill.

---

114 823 [1] This is, perhaps, the one place in these ten cases where a lack of knowledge concerning Klamath culture led the analyst astray. The Klamath are astride the western volcanic belt and one of the most frequent kinds of materials used in their tool manufacture was obsidian. Hence Sparrow's use of the word reflects his interest in and awareness of an important local raw material.

*159
156 and anxiety associated with her responsibility in a double murder. She had
given a rifle as a present to a lover, and following a drinking party at her
house he had killed his brother and a stranger with it. Her thinking was extremely morbid. She expresses the wish that the more violent of her previous
husbands would return and kill her.

*159 In the testing and interview sessions Nell's behavior quite definitely was not
representative of her ordinary interactions, and once she felt somewhat relieved
•157 she immediately got more distant, withdrawn, and unapproachable. During testing
[124] she exhibited a high level of manifest anxiety and an erratic pattern of interaction. She was alternately over-talkative and quick to reply or to initiate
[152] a sequence, and then silent and down-cast. Her concern was real, for it was
known that she was under suspicion for complicity in the murder, but this was
not the root of her anxiety. What the connection was cannot be evaluated from
available evidence, but it may be that her conflicts were related to the trouble
her lover had gotten into, for it was his situation she wanted most to talk
[156] about. Normally she is relatively inflexible in her relationships and preserves
her withdrawn and isolated position at all costs. Her behavior then exhibits
a high level of drive, but is poorly organized, confused as to goals, and produces repeated overt conflict with lovers, husbands, her parents, her children,
work associates, other community members, and law enforcement agents. Still,
she expresses the need to be cared for and dominated consciously, as well as the
156 feeling that she was being persecuted and rejected. She feels herself to be an
entirely worthless person, and this evaluation is shared by the community at large.

Rorschach Record

125 Note: With little variation between cards, each was approached by the S. in
*159 the following manner: She would take the card, repeatedly twist it and turn
it, swiftly cover portions of the blot with her hand or fingers, hold it at
arms length, hold it closer and examine it carefully, lay it down momentarily
and stare off "thinking," and then after a silent delay of an average 145" spit
out a series of responses rapidly, as if they were hot peas.

Rorschach Interpretation

Of this young woman's 27 responses to the blots only six are based completely on the shape of the blot. The balance of determinants, however, suggests that she probably has sufficient control over this emotional lability to effect an adequate adjustment (M:Sum/C = 8:4.5; Sum/c:Sum/C = 5:4.5). An extensive fantasy life and caution, motivated by fear, enable her to respond in an appropriate and realistic manner much of the time. However, in five of her nine whole responses she pays little or no attention to the shape of the blot (R13, R17, R20, R21, R25). These constitute vague, diffuse responses and indicate that much of her behavior is of this nature: diffuse, over-emotional, poorly controlled, primitive. If she is able to control her affectivity then, it is not the result of an easy, automatic control; it is, rather, control based on fear and inhibition. 157● 159* (125)

Her long delay before responding stands out as a characteristic feature of her record. Her initial reaction time is probably the longest of the sample and is (125)

157
159
125 very extreme when compared with white American Rorschach protocols. What is the meaning of this delay? What psychological processes are going on in the interim? Her subsequent rapid delivery of varied and generally appropriate responses suggests that she is, in fact, concentrating on the task at hand and arriving at feasible solutions to the task which the examiner presented to her ("What does this look like to you?"). However, the question remains: why doesn't she talk during this process?

152 One thing we know: she isn't apathetic or disinterested. On the contrary, underlying her delay, there is considerable feeling. Not only does she give four CF responses, but she gives diffuse responses to the blackness and shading elements of the cards. Her first responses to Cards IV, VI, VII, and VIII are vague, whole responses with little, if any, form element involved. Her delay and control do not allow her to succeed in integrating her feelings and impulses with the objective demands of the situation. In R17, for example, we are able to see the manner in which her mental processes may, on occasion, totally ignore the environmental requirements for appropriate behavior. Her response here is "pictures of duck hunters." On inquiry we learn, however, that there are no ducks and no hunters — only fog. Her perception, then, was of a vague, foggy, diffuse world; she enlivened it and peopled it in an elaborate manner through her own rich imagination. To what extent will she allow this rich imagination to overwhelm the demands of the external world? Her Rorschach responses indicate that this will occur often in a sporadic fashion, but that she will be able to recover from these periods and correctly evaluate the situation once again.

This over-ideation, — especially in the light of R26, "men plotting something" — suggests a distinct paranoid trend. She is suspicious of the motives of others and fearful of what the future has in store for her. Even natural forces are considered powerfully threatening; R20, for example, indicates that lightning is "trying to strike" the house.

An analysis of the roles reflected in the human movement responses suggest that this woman has managed to adopt a wide variety of role patterns. She has human movement responses which are verbally aggressive (R26), grasping (R3), guarded (R9), totally immobile (R15), as well as complex (R23). It is this rich, imaginative fantasy life which enables her to delay responding to the blots for such a long time. The reason she must delay is that she does not trust the environment and the people in it.

Some of her movement responses demand more careful analysis. Three of the eight M are old ladies or witches; witches "are old and mean," she tells us. Since her very first response to the test is also a "witch," it would be remiss not to try to determine the personal significance of this response. We are probably on reasonably safe ground assuming that it reflects her attitudes toward older women and therefore some kind of mother figure. Her mother could not have been very nurturing or warm, nor is she likely to see herself as a particularly nurturing person; she does not feel comfortable giving emotionally to others. On the other hand, R3 suggests that she is not content to "do without." If rewards
158 do not come easily, she is ready to "reach out" for it. At the same time, however, we must note the content of R15: "two girls sleeping...resting...laying." Piotrowski has warned of the pathological significance of this kind of immobile human movement response, suggesting as it does, a willingness to submit to the external forces without a struggle.

Her animal movement responses are also suggestive of a suspicious and hostile role pattern; of the three FM, the first (R7) is "an animal looking over

something," the second (R16) is "a big vulture," the third (R22) is a "cougar 157
stepping lightly." All suggest the general attitude of caution and care which 159*
the subject seems to feel is necessary to avoid dangerous situations.

The comparison of M and FM responses suggests that the subject now enjoys a wider repertoire of roles than she had in the past. No one of her M's, however, is a healthy assertive one; each has its own particular idiosyncratic sign of the subject's inhibition, hostility and suspicion.

One particularly puzzling aspect of her Rorschach summary is the Sum/c:Sum/c' ratio. Piotrowski writes that usually a person gives either light shading or dark shading exclusively. When both are given in substantial quantity, he feels we are dealing with a pathological adjustment. His reasoning appears to be based on his notion that the c reflect a flight response to anxiety, while the c' represent a fight response — clearly incompatible. The present subject appears, indeed, to be torn between these two patterns of adjustment and her behavior is likely to alternate between them. Her actual response to the blots, of long delay followed by "spitting out" the responses, may be a case in point.

This young woman is, then, relying mainly on an extensive fantasy life to cope [154]
with pervasive and powerful pressures both from within herself and from the
environment. Despite a tendency to behave in a diffuse, over-emotional, and
poorly controlled manner at times, she seems by and large to be effecting an
adequate adjustment. Intermittant depressive moods, perhaps temper tantrums on
occasion, punctuate a volatile adjustment.

Rorschach Interpretation

•157 *159 [125] The Rorschach test reflects a person who has managed a satisfactory adjustment largely through the inhibition of whatever originality and creativity he might have possessed. The extremely high a%, the limited range of content, the six populars and the absence of any original responses point to the stereotyped conventionality of this man's psychological process. This apparent dullness is not due, however, to a lack of capacity. His vocabulary, the presence of movement responses, and the occasional well organized whole response indicate that he has the potential to do more with his life than he now settles for.

The effects of this marked inhibition are numerous. Firstly, the extremely long initial reaction times, averaging close to a minute, are indicative of the blocking and caution which marks the record as a whole. Secondly, the color denial in R18 point to the hesitancy with which he approaches emotional situations. Thirdly, the nature of the human movement responses reflect internal conflict, tension, and blocking. The first M in the record (R4) highlights this man's feeling that he is hampered when he tries to express himself. He is not sure whether people can work together or whether efforts at cooperation end in conflict. But even if they work together, people must work extremely hard and are not likely to accomplish very much. This is not to say that this man has not accomplished much in actuality; on the contrary, he probably does work hard and may have substantial achievements to his credit. But, psychologically, he is blocked and wastes much energy in this internal struggle. [156]

The other human movement response (R12) is also not an assertive one; although it is not as blocked as R4, it is a restrained response — probably best classified as "guarded restraint." It does not contradict the interpretation made on the basis of R4. It adds several interesting facets, however. First is the exhibitionistic element; this man needs to be admired. Secondly, both his M's are female — attention is given to the breast in one and to the "big butt" in the other. This preoccupation bespeaks some conflict in his sexual role, which may be one of the dynamic factors in his general inhibition.

[154] A final Rorschach indication of inhibition is the ambiequal experience balance (2:2.5), which according to Rorschach's original monograph points to an obsessive-compulsive adjustment. This man spends time and energy worrying about his psychological conflicts and possibly even about abstract or philosophical issues. For instance, during the inquiry of Card II, he asks, "What's the difference between form and shape?" Although he may merely be expressing some resentment toward the examiner and the inkblots, the other indications of obsessiveness, suggest that this question may be part of an overall pattern of doubting and indecision.

Although many of the FM are also guarded restraint movements, there is one that deserves special attention: "two birds falling to the ground...probably shot." This reflects a role concept in which the subject feels at the mercy of external forces; this would be much more disturbing if it had occurred in an M response. Appearing as it does in an animal movement, it suggests a role which he may experience in states of diminished consciousness or may have lived through in the past. It is clearly a role more appropriate under these circumstances. Is there any significance to the fact that this response follows the very blocked M ("two men trying to lift something")? Does the subject feel that if he makes too great an effort, he will "use up" all his energy and become helpless?

The FM are much more varied than the M and suggest that the S has had to give up certain modes of behavior. The extreme passivity (R5), the aggression (R10), and affection (R3) are all roles which are now outside his repertoire. Although his controls appear adequate, there are indications that some impulses remain which may indeed require control (R17, R8). 157* 159*

All in all, though, the subject appears to have evolved a satisfactory adjustment. Under better circumstances, he might have been freer, more relaxed, and more creative. As it is, he operates under tension, but probably accomplishes a considerable amount.

Aunt May: Female, Age 58

Background Data

*159 [156] Like Carrie, Aunt May's social position is marginal to Klamath and White segments
of the community, and she occupies a position of leadership, although
[184] hers is of a more informal variety. She has 8 years of formal education, but
in her words, has been learning all her life. She has been married four times.
[871] Two marriages were broken by the death of a spouse, one by divorce, and the
[586] fourth, to a White wage worker, to whom she has been married 20 years. One of
the tragedies of her life is that she has never been able to conceive, but she
[842] has made up for this biological failing by formal and informal adoptions of
numerous children, four of whom she had for at least for three years, and one,
[597] an adolescent boy, since birth.

Unlike many of the other subjects, Aunt May is a town girl, although she has
spent some time on a ranch in her youth and would now prefer to live in the
[756] country. When she was young she seriously considered becoming a Shaman, and was
closely identified with one of the surviving "Indian Doctors," but she became
dissatisfied with the prospects of this role. Yet she remained ambitious and
[874] wanted something more for her life than the "other Indians" were getting. She
took up with a white woman who put her to work and trained her as a seamstress.
[759] She became an accomplished mid-wife and frequently will answer to the query if
she knows a certain party, "Do I know him? Why, I cut his umbilical cord with
[857] a pair of my nail scissors." When a small girl she held the role of a "child
nurse" and more or less raised the remainder of her siblings. In recent years
*159 she was literally dragged from her home by a group of white ladies who wanted
156 her to attend their church, a church, which as a girl, on Sunday mornings she
had stood outside, wishing she could enter. She is the social center of gravity
177 for two large but separate circles of Klamath and Whites. She is one of the
184 few Klamath women with whom elite White ladies will associate, and with them
her position is so esteemed and secure that an invitation to her house is highly
[794] valued. For her Klamath friends, relatives, and "pick-up" relatives (i.e., persons
she has taken to her bosom as her own flesh) she is a confidant, an advisor,
[608] and an out-spoken critic. She is out-spokenly critical of many patterns
*159 of contemporary Klamath life, particularly excessive drinking and disordered
156 family life. "When I was a young woman I just stopped drinking. It was making
a mess of my life. I didn't want to be a wet blanket, though. I still went to
[273] dances and all. What happened was that I told the boys that I had broken my
glass." Aunt May's home today is one built with her share of tribal income,
[353] spotlessly clean, well furnished and homey. Every room of the house has its
walls and corners covered with mementos and souvenirs, each of which is associated
with a treasured memory of a particular person and association. It is
noteworthy that these memories are her personal property and do not include her
[571] husband or adopted son. Most of her current social contacts are with Whites,
for although other Klamath visit in her home, she never visits in theirs, because
she does not want to get involved in their arguments.

•[157] Aunt May is an extremely assertive woman whose tongue is too often sharp and
biting, but every criticism is immediately followed by an effort to soften a
person up, reflecting her extreme sensitivity to personal relationships. Perhaps,
like Carrie, this strong joking behavior constitutes an appropriate social
role. Aunt May is equally sensitive to the reactions of others to her and she
will call friends to task for imagined snubs. In public she sits erect and
quiet, yet attentive to all that is going on about her, and with great care

Rorschach Interpretation

159*
157●

This is a rich, moderately well-balanced record, except possibly for over-emphasis on W and consequent inattention to the usual details. However, the whole responses are generally adequate, the M responses are good, and the color responses balanced. The subject is apparently a woman who tends to deal with the overall situation, occasionally to the exclusion of the practical details of day-to-day living. She seems to be striving, planning as if in an attempt to achieve something. The high W and the emblem on Card I are consistent with this need to attain something. She has a wide range of interests and possibly is somewhat more cultured than most Klamath (R4, for example).

On the other hand, she is not a "driven" person, in the sense that she does not allow herself to have a good time. During the testing she apparently enjoys herself. She laughs, she sews, and she appears to be relaxed. She gives her rich imagination free rein, and rarely does it get beyond her control. Occasionally it does, as it will with anybody who just lets themselves go. (Note the "monkey standing on his tail" on Card VI).

Only seventeen of her 42 responses involved merely form as a determinant. The other twenty-five responses are determined either by kinesthetic (internal) stimuli, color, shading or a combination of these elements. Thus, the woman is relaxed enough to allow her emotions to influence her responses. Her comments also appear particularly relaxed, e.g., "I dunno what the devil these things are," or "Don't you write that down, you crook!" But what are her emotions and needs? Where in this full record shall we find the clues to her inner life?

Her six movement responses are very diverse: "men dressed as bears dancing," "guys making a puppet show," "fan dancers," "cannibal who just ate a carcass,"

*157 *159 "girls tied together by hair," and "guys on cliff handing something to one another." The "cannibal" and "punished girls" responses are certainly aggressive enough, but what of the cooperation implied in the "guys on a cliff" response? The "men dressed as bears" and the "puppet show" are playful, assertive and free, while the "fan dancer" reflects that extra gaiety of which the subject herself seems somewhat abashed (she "breaks out in laughter"). These are all human movement responses and thus the subject is capable of experiencing [155] all the diverse roles reflected. In a person with fewer other resources this might lead to unbearable conflicts, but in this woman there seem to be the strengths which make it possible for her generally to utilize this flexibility, despite the conflict. These additional resources are reflected in the use of color and shading (dark and light).

Her color responses are generally adequate and of a positive kind — although somewhat shallow. The presence of many responses to the black and white are interpreted by Oberholzer (1944) as further evidence of shallow, lazy affect. Thus, she probably does not get too deeply involved with people. She can get along with others moderately well, but she really does not need them.

[126] The presence of six popular responses and an P plus % above 80 are sufficient indication of her ability to attend to conventional aspects of the environment in a realistic manner, despite her tendency to experience her emotions.

[156] Nonetheless, there is the hesitancy in interpersonal relations which we have seen in most of the Klamath records. Here it is reflected in the disguise needed by the figures on Card II and the several aggressive M and FM responses. And she is still pretty unsure that the recent developments in her life are desirable; perhaps the old method of punishment was the best (R29). Probably the essential conflict in roles described above are the keynote of this woman's adjustment. Shall she "eat the carcass" or "lend a helping hand?" Shall she be a "fan dancer" or is any transgression punishable? The comments during the testing are both joking and veiled hostility: "Are you naturally pigeon-toed or do you just sit that way?"

But despite the richness of the record, the woman behind the record remains elusive. Could it be that her enormous flexibility in role taking has made it difficult for her to carry through one integrated life style to the extent which is necessary to call it her own? The Rorschach suggests that this may be the case. However, it is clear that her overall adjustment is a satisfactory one — perhaps eminently so.

Weasel was tested while in jail. He agreed to take the tests via an intermediary, and was anxious and tense throughout the session. But because of numerous experiences in correctional institutions he was quite suave concerning the test situation; he has had them in batteries, the MMPI, the Bender Gestalt, the Picture Frustration Test, some variant of the TAT, but never the "ink-blot" test. The jail situation provided no special stress, and the testing lead to the development of something of a friendship relation with the examiner.

Rorschach Record

No. of Resp.	Score	Time	Response
			I (S. entered the testing room visibly agitated, surveyed the room carefully and suspiciously.) What are you going to do to me? () No, I'm not worried, my hands are just sweating, that's all. (Looks under table at tape recorder) That isn't on, is it? () Etc.
(1)	W F emblem	30"	(Laughs) And is this supposed to LL smth? Well... well...it LL some kind of...Well I don't know. If it wasn't for the little spots it would LL some kind of coat of arms. (AE?) Trying to think of smth I seen one time...may be in fiction
(2)	D Fc (h)		A long, coated jelly...looked like that. Some kind of an animal...it was in this stuff, this jelly; but I don't know what this stuff wd be out here. (AE?) Maybe I'm kinda dense, but no more out here.

(1) Whole. (What kind?) I dunno to be truthful. () No, just the way it's shaped. I never have seen many coats of arms, but that's what it puts me in mind of. (2) Center detail, D1. () I dunno, it was supposed to be transparent. It was fiction, now I remember it. Some people was supposed to go to the moon in a rocket and came back with it. After it started growing it turned into a great big monster, a show on TV or a movie. (Fc here, as shading determined percept, which was seen as a figure thru the transparent jelly)

Rorschach Interpretation

*159 •157 Aggressiveness, almost of a murderous kind, is the first impression one gets from this Rorschach record. Despite the fact that he gives only nine responses, we finish reading the record with the feeling that we know a great deal about this man, but we are no longer convinced of the extent to which he is comfortable with his feelings of hostility.

[158] Perhaps the single most conspicuous feature of the record is the blatant preoccupation with violence, especially in the context of such a brief record and in the light of the personalized quality of the verbalization: "When you press the gun up close to something and it goes off and makes this powder burn — the red spots look like blood." In addition to this hostile content (R3 and R9), analysis of the scoring summary indicates that the subject has inadequate control of these impulses. His Sum/C is 4.5, which is very high in a record of only nine responses, and there is no M and only one shading response. (After much deliberation, it was felt that there was insufficient evidence to score shading in R5.) Furthermore, only one of his responses was determined by the shape of the blot alone, indicating that in practically all situations the subject is likely to be directed by impulses and feelings, rather than by intellectual considerations. The possibility that the seven whole responses constitute ego control and personality organization is contradicted by an inspection of the nature of the W. Of these seven W responses, five and possibly a sixth must be considered vague, diffuse, primitive responses to the global impression of the blot.

There are a few possible indications of some control mechanisms which operate sporadically, however. For one thing, he does not blurt out his responses impulsively; there are relatively long initial reaction times to all the cards. Secondly, he does give attention to the shading elements (R2 and possibly R5). Nevertheless, these constitute insufficient controls for the tremendous energy available (Sum/c:Sum/C = 2:4.5).

The long initial reaction times, the few R and many of the verbalizations point to a guarded, suspicious approach to life. This finding, combined with the absence of M, is strongly suggestive of a paranoid adjustment. Life in general, and human relationships in particular, is seen as a struggle: the response closest to an M is the "fighting blackbirds." However, the subject does not have very strong attitudes about interpersonal relations. His feelings about people are shallow and ill-defined. He does not have close friendships: the figures on Card I, often seen as human, are seen by him through transparent jelly; he rejects Card III suggesting a human movement shock; and his few R suggest that he is unwilling to extend himself in the test situation.

[156] The "coat of arms" response suggests that what little feeling he has for human relationships is focused on the overt signs of social status. He is likely to

be very much involved with how he appears in the eyes of others. This attitude, 159*
together with his hostility and lack of impulse control, may get him into con- 157●
siderable trouble through inappropriate attempts to attain some semblance of
what he considers status. This may appear as "attention-getting" mechanisms. [156]

There is no need to ponder the question of whether this man is actually the aggressor or the victim. He is both. At times, he probably instigates the trouble. But just as often he is likely to be punished for his transgressions. On occasion he may act aggressively as a result of some fancied aggression. He doesn't trust anyone; no one is likely to trust him. He is essentially an isolated person. His minority group status probably fits easily into this conception of his role in life and his essential feelings of isolation and rejection. [156]

However, his last responses (especially R6 and R8) appear to raise doubts about some of our interpretations. These almost effeminate —artistic, at least — color responses: "coral rocks" and "modern art," coming at the end of the record as they do, indicate that beneath this belligerent facade, we may come upon gentleness, sensitivity, and passivity which might surprise us. He is capable of moments of deep positive, perhaps aesthetic, feeling. We must raise the hypothesis that this young man is really a "softie" who is trying to deny this trait in himself or, in other words, he is just a big bluff.

This pattern may suggest the psychoanalytic hypothesis of paranoia, namely
repressed and projected homosexuality —if we define sexuality in broad enough
terms. The suspiciousness, belligerence, interpersonal isolation and latent
aesthetic sensitivity all are consistent with this notion. At least some sexual [158]
disturbance seems indicated by the way he mutilates the fox skin on VI; all the
extensions are cut off.

One aspect of this record remains puzzling: the relation between the c and c'. We get dark shading (c') on at least two occasions (R3, R9) and light shading on at least one (R2). If R5 is scored light shading, there is a balance of dark and light shading responses and indication of anxiety, control and neuroses. If, on the other hand, R5 is a dark shading response, the balance of determinants becomes even more extreme in the direction of lack of control. Piotrowski's principle is that the c' are given by people who fight rather than flee from anxiety provoking situations. My overall impression is that this subject is more likely to behave in the "fight" manner and thus get himself into a considerable amount of difficulty, but the possibility that R5 is a shading response is unsettling.

The m response on Card IX, when interpreted according to Piotrowski's principles, indicates that the subject would like to "explode" but feels incapable of this kind of behavior. Since this is a subjective feeling, it does not contradict the position that he does act out in an uncontrolled manner; rather, it suggests that, despite sporadic outbursts, he feels tense, as if he is operating under a constant head of steam that doesn't let up, even when he does blow off on occasion.

This m, the possibility that R5 is a c response, and the positive affect expressed in R6 and R8 indicate that, although the subject has violent moods, he is far from comfortable in this role. He is tense, anxious, frightened. There may be something about him which, at times, another person can understand and sympathize with.

In general though, he is wary of others, they are wary of him, and "trouble is brewing." [156]

Grandma Williams: Female, Age 87

Background Data

*159
156 Understandably, it is difficult to find a match for a person like Weasel, particularly
in the instance of a woman who occupies a similar status. The few
[593] Klamath women who were like Weasel were not available for testing. Grandma
William's position is that of the mother of a large, disorganized nuclear family
[733] like Weasel's, one marked by excessive drinking, violence, and promiscuity.
[83] She is a vigorous, hearty, earthy old woman who has borne eight children by
three husbands. She is once divorced and twice widowed, her first husband
[587] having died after three years of marriage, her third after thirty-five. She
[871] completed six years of school, all that was available when she was a girl, and
she has lived and visited for extended periods in Washington state, Missouri,
[178] California, and Mexico.

[657] Grandma William's mother was a traditional Klamath wife and mother, and her father
for years an Agency Indian policeman. In her words, both her family of orientation
[464] and her family of procreation have had "bad luck." This bad luck consists of numerous
bouts with the law over acts of violence. Her father died in the Federal
penitentiary where he was serving a life sentence for murder. Several of her
sons have killed men in the past. One is reputed to have killed at least five,
and he is now in a State institution. Her other children are noted for their
violence, and local informants say of Grandma that they cannot understand how
such "a wonderful, good old lady managed to produce so many worthless children."
[577] Few feel that she deserves such a fate. Community acceptance of Grandma Williams
is based upon several attributes, her steady, hard work, her commitment to raising
[177] a family, her devoutly Christian behavior, her espousal of dominant White values,
and, especially, her hearty good humor. She has never accepted the guilt of
either her father or her sons, maintains that they were falsely accused, and
has worked steadily to secure her one son's pardon.

[191] Grandma Williams was raised in a Klamath speaking household and acquired her
English in school. She is very proud of her education and maintains that children
[871] today are not so well tutored in the 3 Rs as she was. She claims that "I
can just about out-spell, out-write, and out-figure all of my kids." This is by
[593] no means the only aggressive, competitive attitude she maintains towards her
children, none of whom have ever quite lived up to her standards. In this respect,
[603] Clifton was once able to witness her training a grandson, who was an alert,
[867] spontaneous, active lad. The boy was made to be too polite and too formal, behaviors
in keeping perhaps with urban middle-class society, but very much out of
place on the reservation. All of her sons have maintained their main affiliations
with the local "cowboy" culture, but they are ridiculed for their efforts at
riding and calf roping because of their obesity and clumsyness, none of them
coming near, in physical type, to the slim hipped, pencil shaped cowboy ideal.
[657] She is an excellent example of a woman who, early in the reservation period, was
carefully tutored by conscientious minister-teachers in inappropriate behaviors
[871] and values, and who has attempted to transmit these to her children. It would
seem that she has produced over-trained, and mis-trained, hostile children, who
[177] promptly discovered that regardless of their veneer of "culture" they were rejected
from many local circles because of their Indianness.

*159 Grandma is a direct, forceful person, another Klamath woman with a sharp wit
● 157 (yet a less personal one than Aunt May's). She is quick to initiate interchanges
156 and to attempt to knit together a strained situation. Yet her responses

are marked by alternate periods of (brooding?) silence and she is more than a little pretentious, as for example her response to TAT card #1, "Oh, that's that famous European violinist...Levi Strauss." Her life has been characterized by many extremely stressful situations, but she does not seem easily discouraged, and maintains her vigor and independence. She tends to over justify herself, as if she had some doubt about certain of her characteristics, or as if she had strong feelings of uncertainty or inadequacy. This is in strong contrast to her leadership role in her family, and her domination of many social situations. She is also somewhat excitable and tends to directly express her emotions more than many other Klamath. 159* 157• [156] [155] [156]

The working relationship with Grandma was one of the best. When she first learned the writer was an Anthropologist she warmed to him immediately and volunteered to take the tests. She was tested "on the job," at the top of a 200 foot fire lookout tower in the midst of the Klamath forest. 159* 124 [123]

Rorschach Interpretation

*159 *157 The Rorschach reflects a woman who is extraordinarily preoccupied with disease (at = 10+5). If she is not physically ill, she is hypochondriacal and perhaps suffering from somatic delusions (at R; F+%, 52). She is likely to be very ill at ease in interpersonal relationships (M on Card II), probably because she is demanding of attention from others (C:CF:FC). I wonder if she doesn't use physical illness in order to be taken care of.
